But the objection is urged that many men do not wish to keep live stock, but want to sell hay and grain as well as potatoes, and how are they to keep up soil fertility. Were it not for such crops as clovers, peas, vetches, &c., it could not be done, but with care and economy the proposition can probably be worked out without applying potash for a few years.

While perhaps it may be somewhat superfluous to interject any remark those potato growers who will not keep stock, it is nevertheless time, that they are missing a great opportunity of doing themselves and the province good by their failure to keep stock. No country nor people can ever become great agriculturally without stock husbandry. All history goes to show it and the experience of the last 25 years in the United States and to a less extent in Canada proves it.

Theoretically, specialization is splendid, practically, mixed farming in combination with a special money crop, beats any specialty by long odd.

By the figures above given we have seen the demands on the soil for the crops of our three-year rotation. What will be required in the way of chemical fertilizers to meet this demand? The first requirement, before any fertilizer can act, is an adequate supply of humus. This will likely be provided by the ploughing under and thorough cultivation of a good sod. This, with the application of lime in some form, will help to make the inert potash soluble and thus available for the crop. This sod, especially a clover sod, in its decay sets free considerable quantities of Nitrogen and we might expect up to 60 lbs. per acre.

We found the requirements of our three crops were 123 lbs. nitrogen, 83 lbs. Phosphoric Acid and 248 lbs. Potash. We expect to have at least 60 lbs. available nitrogen in the soil, leaving a shortage of 63 lbs., to make up this we can supply 450 lbs. Nitrat of Soda or 340 lbs. Sulphate of Ammonia, 68 lbs. of Nitrogen, preferably half of it on the potato crop and the other half after the oats are up the second year. Then for Phosphoric Acid we can use Acid Phosphate, which to supply 83 lbs. of Phosphoric Acid will require about 600 lbs., but as much of this is but slowly available and will be retained in the soil, it would be well to apply from 1,000 to 1,200 lbs. as at the same time we are applying a considerable proportion of lime. Basic Slag may be used instead of Acid Phosphate, or bone meal in the same form if preferred The Potash, for the present we will omit entirely and trust with considerable confidence to the natural supply through our good tillage methods becoming available for the use of the crop. Our confidence will be strength ened where the soil is made up largely from the decay of the Upper Silurian rock formation which underlies mose of Victoria, Carleton Counties and part of York, for this rock is known to be comparatively rich in Potash. To further provide lime in connection with the potato crop, from 500 to 1,000 lbs. Gypsum can no doubt be added with good effect, as this form of lime is said to be especially useful in acting on the Potash. Marl, ground limestone and burned lime slaked can all be used, but unless the soil is very sour and they are necessary for the growth of clover, there is a risk of encouraging scabbly potatoes, though in our experiments in two years at the Experimental Station, where our soil needs lime, we did not find any increase of scab from slaked lime, applied even at the rate of two tons per acre.

In regard to potash, we tried for two years in different soils to see what result we had from the application of 4-8-3, 4-8-6 and 4-8-10 mixtures at the rate of 1,000 lbs. per acre, both years we got best results from the 4-8-6 mixture, showing that in our soils at least no benefit was received from an excess of Potash.

The figures were as follows:—

In 1913 the yield from the 4-8-6 mixture was approximately 20 bushels per acre more than for the 4-8-10. In 1914 the 4-8-6 mixture gave 319 bushels and 44 lbs., the 4-8-10 mixture 315 bushels and 4 lbs., the 4-8-3 mixture 299 bushels and 10 lbs., and the check plot without fertilizer of any kind, gave 192 bushels.

To summarize:—

1. There are large reserve stores of the elements of fertility in all our good soils.

2. These elements become slowly available from year to year by good agricultural methods.

3. Humus is an all important constituent of soils for crop production.

4. So called worn out soils can be brought to a good state of fertility by cultivation and the ploughing under of green crops, with small and no expensive application of fertilizers.

5. Barn-yard manure is the most economical form of fertilizer for all crops, with but few exceptions.

6. Clover (including all legumes) as a renovating crop is equally important with the use of barn-yard manure and, where such manure is not used, it is an imperative necessity to maintaining the humus and nitrogen supply.

7. Reserve stores of potash in our soils, especially of those of Victoria, Carleton and York are such that we should be able to grow good crops for at least 50 years without finding imported potash an absolute necessity.

8. Fertility in connection with potato growing must therefore be maintained and increased by the application of from 13 to 20 tons of barn-yard manure per acre on a three-year rotation of potatoes, oats and clover, or by the application of 400 to 500 lbs. Nitrate of Soda or Sulphat of Ammonia and from 600 to 1,200 lbs. Acid

Barrett *Made in Canada*

Money Savers for Farmers

Seven good products good in more than Seventy different places

YOU can't beat arithmetic. When you buy something that has a limited usefulness your purchase is almost a luxury. But when you buy articles that you can use every day around the farm you purchase money-saving utilities. Such is the line of Barrett Money Savers. Every one is a quality leader of its kind. Every one comes from the home of business success. Every one will put money in your pocket at some time or other by saving you costly repairs, renewals or deterioration. Look over this advertisement and see if you are not struggling along without something you ought to have and can have for the minimum outlay.

EVERJET Elastic Paint is the best thing you can use on smooth-surfaced or metal roofing, on agricultural implements, structural iron work, fences and exposed surfaces. It is elastic, adhesive, and will not rub, crack or peel. Good in any climate. Don't let your implements or iron work deteriorate by rusting. Use Everjet Paint. It's permanent, cheap, and has great covering capacity.

YOUR live stock will be free from annoyance by insects, flies, lice and vermin if you spray them lightly with Creonoid, the peerless lice destroyer and cow spray. Not a deodorant, but a destroyer. It helps to make healthy, happy horses, contented cows and placid-minded pigs. You know that vermin-infested live stock can't be profitable. Give them a chance. Use Creonoid in the barn, the pig-sty, the poultry house. You'll see a difference. Sold in 1, 5 and 10 gallon containers and in half and full barrels.

HERE is a ready roofing that needs no painting or other attention to keep it watertight. Amatite Roofing has a mineral surface that laughs at wind and weather. Very attractive because of its bright, sparkling appearance. Wherever you have steep roofs, you need Amatite. Amatite is made in rolls of 110 square feet with galvanized nails and cement in center. Try it.

HERE is a ready roofing that should not be overlooked. Everlastic is a "Rubber Roofing" of wonderful toughness and durability. You can't beat it for use on any steep roof. Inexpensive, easy to lay, and will be on the job keeping out water for years.

CARBONOL is a household wonder. It cleans, heals, disinfects, purifies. If you cut your hand, apply Carbonol in weakened solution. If your live stock get bruised, Carbonol will fix them up. If your house, barn or poultry house needs disinfecting, there is nothing like Carbonol. And it is wonderfully effective as a destroyer of vermin. Carbonol belongs on every farm in Canada.

YOU know the wonderful preserving qualities of Creosote. Well, Barrett's Grade One Creosote Oil is the greatest product ever turned out in commercialized Creosote. It will insure your woodwork against decay. Applied to the posts of a fence it will add 15 years to that fence's life. By actual tests, it penetrates farther than any other preservative.

Barrett's Grade One Liquid **Creosote Oil**

FOR the quick repairs that are daily necessary on the farm, you need Elastigum. It is an elastic, waterproof cement. It is tenacious and durable. Just the thing for joining and relining gutters, flashings around chimneys, sealing leaks in exposed places, renewing gutters, stuffing cornices and putting glasses in greenhouses or skylights. It is easy to apply, is acid-proof and damp-proof and it "sticks".

Send for illustrated booklet describing Barrett Money Savers in detail. Address nearest office.
For sale by good dealers everywhere.

Phosphate, Basic Slag or Bone Meal.

9. In the course of the next 50 years it would be well to try and secure a potash supply wherewith to supplement the reserve stock then existent in the soil. For some years to come there is probably no cause for alarm.

A Guidance to Stable and Barn Construction and Fitting.

We have recently received a copy of Beatty Bros. B. T. Barn Book. This new Barn Book is well illustrated and shows splendid illustrations of some of the best barns from the Atlantic to the Pacific when B. T. equipment is used. Any farmer who is planning to build a new barn or remodel an old one will find illustrations and descriptions of a wide line of labor saving devices in the B. T. Barn Book which we are informed is sent free on request to interested farmers. It will show you many useful ideas in barn and stable construction and fitting. Send for a copy to Beatty Bros, Fergus, Ont.

Hill Selecting of Potatoes for Seed

Good seed is worth all of its cost of production; poor, weak seed is dear at any price. Seed of great vitality is of the utmost importance to the grower, and the losses due to poor seed would be staggering if fully realized. There is a widespread practice, among farmers, of planting second-size potatoes, regardless of whether they come from vigorous hills or not. This is a serious mistake which can have only one result, i.e., the early running out of the variety. The practice of hill selection should be carried out, for, although it involves some extra labor, it is worth many times its cost.

If the seed has been planted one seed piece in a place, uniformity of selection can be secured by confining the choice to the one-stalk hills in the field. This method can be varied, however, by setting a standard in the ratio of not less than four good, marketable potatoes to a one-stalk hill, and ten to a three-stalk hill. When the crop is half or two-thirds ripened, the grower, with a bundle of twigs or sticks, goes over the field and marks a number of the hills showing exceptional vigor, for next year's seed. When the crop is ready for digging, these marked hills can be dug by hand. All of the marked plants have shown vigor but all may not produce desirable tubers. Any marked hill which produces fewer tubers than we have set for the standard, or is undesirable in other respects, should be discarded. Selection in this manner secures vigor, which is of prime importance in enabling the crop to withstand insects and diseases. Moreover, the grower is obtaining all of his seed stock from hills that have produced a fair number of marketable tubers, thus insuring an increased yield.—F. C. N.

Soft Iron Wire Makes Good Belt Lace

Ordinary stove pipe wire, or any soft iron wire about eighteen or twenty gauge makes good belt lacing. Punch small holes about one-half an inch apart and one-half an inch from the end of the belt, lace with a double row of wire and twist the ends together. Place the joint on an anvil or a pulley and pound the lace into the belt.

You can lace large belts this way and they will be practically noiseless and last a long time.

Do your cows pay? The scales and Babcock test should be used to answer this question.

Unsatisfactory dealings could be avoided if the prospective buyer would make a personal visit to pick out the stock he wants.

Production and Thrift

"CANADA from her abundance can help supply the Empire's needs, and this must be a comforting thought for those upon whom the heavy burden of directing the Empire's affairs has been laid. Gain or no gain the course before the farmers of Canada is as clear as it was last year—they must produce abundantly in order to meet the demands that may be made and I believe this to be especially true in regard to live stock, the world's supply of which must be particularly affected in this vast struggle. Stress and strain may yet be in store for us all before this tragic conflict is over, but not one of us doubts the issue, and Canadians will do their duty in the highest sense of that great word."—*HON. MARTIN BURRELL, Minister of Agriculture.*

"MODERN war is made by resources, by money, by foodstuffs, as well as by men and by munitions. While war is our first business, it is the imperative duty of every man in Canada to produce all that he can, to work doubly hard while our soldiers are in the trenches, in order that the resources of the country may not only be conserved, but increased, for the great struggle that lies before us. *'Work and Save'* is a good motto for War-time."—*SIR THOMAS WHITE, Minister of Finance.*

THE CALL OF EMPIRE COMES AGAIN IN 1916

TO CANADIAN FARMERS, DAIRYMEN, FRUIT GROWERS, GARDENERS

WHAT IS NEEDED? THESE IN PARTICULAR—

WHEAT, OATS, HAY,
BEEF, PORK, BACON,
CHEESE, EGGS, BUTTER, POULTRY,
CANNED FRUITS, FRUIT JAMS,
SUGAR, HONEY, WOOL, FLAX FIBRE,
BEANS, PEAS, DRIED VEGETABLES

We must feed ourselves, feed our soldiers, and help feed the Allies. The need is greater in 1916 than it was in 1915. The difficulties are greater, the task is heavier, the need is more urgent, the call to patriotism is louder—therefore be thrifty and produce to the limit.

"THE AGRICULTURAL WAR BOOK FOR 1916" is now in the press. To be had from The Publications Branch, Department of Agriculture, Ottawa.

Arbor Day 1916

(Continued from page 483.)

destroy everything loose that mars the appearance of the ground. Note where ground is wet or swampy and how it may best be drained. The play part of the school yard should be particularly clean and dry. Plan to spend a part of Arbor Day in providing and setting up at least one piece of apparatus for play use. Endeavor to enlist the practical sympathy of the women of the district, especially if there be members of a Women's Institute living there. These Institutes stand for "Home and Country." They will be found effective organizations for giving form to real local improvement by establishing it in the school.

Usually, trustees will be pleased to co-operate with the teachers and pupils and aid in securing assistance needed by getting trees, supplying the material and personally by coming to the school on Arbor Day and directing work, if for no more than two hours

Do not plan to close up school effort for the day at noon or one o'clock. Nothing dampens or weakens efforts more than by thus saying in effect, "Arbor Day is not so important as other school days, there is not much to do." Have part of the afternoon devoted to Nature talks, readings, songs and games. Combine physical mental, and moral effort of the child for his education. Do not forget the birds and their homes. Aim to put up one or two bird houses. Have one pupil selected to speak on behalf of the birds—a plea for their protection. Endeavor when ratepayers and ladies are present with the pupils to discuss plans for keeping the school property in an attractive condition during the vacation perood. Impress upon them that the school is about the only piece of property in which all the people of the community have ownership and that it therefore expresses their standing and their appreciation of the province. A disorderly, unkept school ground and garden in August often does much to discredit a community. If only dead apparatus is cared for and it only because it is policed by lock and key, appreciation of real local values is far too low. By a little effort and no money expenditure necessarily the school ground and garden may be kept neat and pretty and at the same time give enjoyment to all. The pleasure will be greater the more the social element is fostered.

So far as may be, weather and soil conditions permitting, the school garden may receive needed attention on Arbor Day. In large schools particularly, often there is not enough for the pupils to do. A well arranged time table for the day will include garden work for all, a class of not more than ten under a competent head working at one time. Where conditions for school ground effort are unfavorable, the preparation of window boxes and seed planting will have a good effect. In fact, in every school some of this work will be found to be interesting and useful.

In conclusion, begin early, be wise prepare thoroughly, definitely decide on your course of action, make Arbor Day educative, not only to the pupils, but strive to make it a feature of community interest. Magnify the school as a factor of local value worthy of support.

Every teacher will do well to obtain catalogues from seed houses. These give important information regarding plant cultivation.

Vines for walls or to screen—morning glory, wild cucumber, five fingered ivy, Virginia creeper, trumpet creeper, honeysuckle.

Shrubs—Lilac, rosebush, snowball, syringa, spirea.—R. P Steeves, Director Elementary - Agricultural Education.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

Back-Yard Gardens

Every citizen can render service in the production of foodstuffs. Even in the heart of populous cities something can frequently be done. Cellars and roofs have been utilized for this purpose in New York. One fact worth bearing in mind is that every ounce of needed produce grown is so much added to the wealth of the country. If some part of the energy of every householder in Canada were bent upon producing something eatable, no matter how small, thousands of tons of valuable produce would be forthcoming, all of which whether consumed in the household or not, would help to make available for use in other ways an equal quantity and would aid in modifying the cost of living. Last year considerable progress was made in the appropriation of the seemingly waste land in towns and cities to useful purposes. Considerable success was achieved and this year it is not to be doubted the experiment will be extended with greater results. In fact in many centres plans made last fall or during the winter are already being carried out.

Germany has laid down utilization of the land, every foot of land, as one of her first principles. Every inch of land, according to the Teutonic proclamation, that is not used is so much of the country's resources wasted. France has adopted a regulation to the effect that every bit of space must be used for production; failing this being done by the owner the state is to take possession. Britain has given orders that golf courses and all meadow land are to be used for grazing purposes, and that previous pastures are to be put down in crops. Private parks are also being wooded out and the land devoted to practical agriculture. A campaign is being conducted having for its object the utilization of backyard gardens and all manner of vacant land. Thus the chief belligerents are setting the world an example in production and thrift that Canada would be wise to profit by as widely as possible and that municipalities an public bodies should do their utmost to encourage.

Roof with Paroid

Look for the Paroid Roll

WHAT looks like a saving in first cost, may in a few years prove a big expense. Paroid Roofing is so carefully made of tested materials, you avoid the repair bills that add heavily to the cost of a cheap roof. The first Paroid Roofs laid 18 years ago are still in good condition.

NEPONSET Paroid ROOFING

can be laid by yourself and your farm help so that in the wildest gale, the heaviest rain or snow storm, or while fire is raging, you need know no anxiety for your Paroid Roofs. Paroid is the roofing that will save you money. Made in Red, Grey and Green.

Look for the Paroid roll, by it you will know one of the 2,000 Neponset dealers in Canada.

Write for copy of "Repairing and Building"—FREE on request.

Try Neponset Wall Board in place of lumber, or laths and plaster—you'll like it.

CHILDREN'S COUGHS

What Every Mother Should Know.

Doctors declare that cough-cures containing opium, morphine, or paregoric should never be given to children, save under medical directions. Most cough mixtures contain those things; Veno's Lightning Cough Cure does not. Veno's is guaranteed poison-free, and the ideal children's cough remedy. All kinds of children's coughs yield to Veno's—even whooping cough, however violent.

Awarded Grand Prix and Gold Medal, International Health Exhibition, Paris, 1910.

Ask your English, Scotch, Irish, Welsh friends about Veno's Lightning Cough Cure. They know. Veno's is a British remedy, made in Britain by British capital and labour, and used wherever the grand old British flag flies. Give it your children, take it yourself; it is the remedy for—

Coughs and Colds
Bronchial Troubles
Nasal Catarrh
Hoarseness
Difficult Breathing
Whooping Cough
Blood Spitting
Asthma

Price 30 *cents.*

Large size containing 2½ times the quantity 60 cents. Sold by Druggists and Dealers everywhere, or direct, on receipt of price, from the sole agents for Canada, Harold F. Ritchie & Co., Ltd., 10, McCaul Street, Toronto.

Proprietors:—The Veno Drug Co., Ltd., Manchester, Eng.

VENO'S LIGHTNING COUGH CURE

Scores of reports of the operations carried on in the seasn of 1915 by the small householders speak of produce being grown worth from twenty-five to fifty dollars, every dollar of which meant so much added to the wealth of the country as well as saved in the cost of living. Financial profit is not the only gain forthcoming. Lessons of industry and thrift are inculcated and the whole household, from the oldest to the youngest, come under the influence of those qualities. They also have the gratification of eating fresh vegetables, the enjoyment of which is tremendously enhanced by the proud knowledge that they are home grown. What the families cannot eat themselves they have the pleasure of giving or selling to their neighbors or sending to some charity. It is hard to imagine any greater or more enduring satisfaction than a household in modest circumstances can experience than that to be derived as the reward of loving industry in a backyard garden.

Treat Seed Oats for Smut

Last season was particularly favorable to oat smut in the eastern part of Canada, resulting in a great increase of loss from this source. The grain crop will also be worse infected than usual, hence farmers should treat their seed oats very carefully this spring. A small expenditure of time and of money may, in this way, increase the yield per acre by five to fifteen bushels.

The prevention for smut in oats is as follows: On the evening before the seed oats are to be sown prepare a solution of formaldehyde (formalin) 1 pint to 40 gals. of water. Spread the oats five inches deep on the barn floor and sprinkle one gallon of the solution to each bushel. Shovel over thoroughly and cover the pile completely with the oat sacks, blankets, etc. The following morning spread the pile out to dry. Much of the moisture will have been absorbed by the grain, hence the seeder should be regulated to allow for the swelling of the seed.

Seeding of Clover

J. M. McLean, New Perth, P. E. I., says: "During the last two years the first crop of hay was always much better on the area sown with 10 pounds of clover and 10 pounds timothy, while this year we have an unusual stand of clover in the plots heavily seeded. We find the second crp is always much thicker and of a better quality after the thick seeding."

Numerous comparisons have been made on the Illustration Farms in the way of trying out home-grown seed side by side with that purchased from seed houses. The home-grown seed has given, in every instance, better results. In some cases the home-grown seed was just enough hardier to survive the winter while the crop from the purchased seed suffered very much from winter killing. The wise farmer will plan now to have a crop of clover seed this coming summer, if possible. By cutting the first crop early, the second or seed crop is allowed to get an early start.—F. C. Nunnick.

Production and Thrift Campaign

Plant a Vegetable Garden this Spring.

A garden 60x100 feet should produce sufficient vegetables for a family of ten persons, and leave some surplus for storage for winter. Cultivated by hand, it will occupy most of the spare time of a city dweller. A man cannot be a motor car or baseball enthusiast and at the same time make a success of a garden of this size. Hoever, even smaller plots, if intelligently handled, may be made to yield an astonishing quantity of good , crisp vegetables which have not lost their health-preserving value in the store window. Where the space avaliable is small, crops should be seleced that take but little space and give quicg returns. Potatoes, cabbage, corn, egg-plant, peppers, had better be dispensed with, an the space devoted to such things as peas, beans, spinach, lettuce, carrots, beets, tomatoes and onions. Tomatoes should be stake-trained.

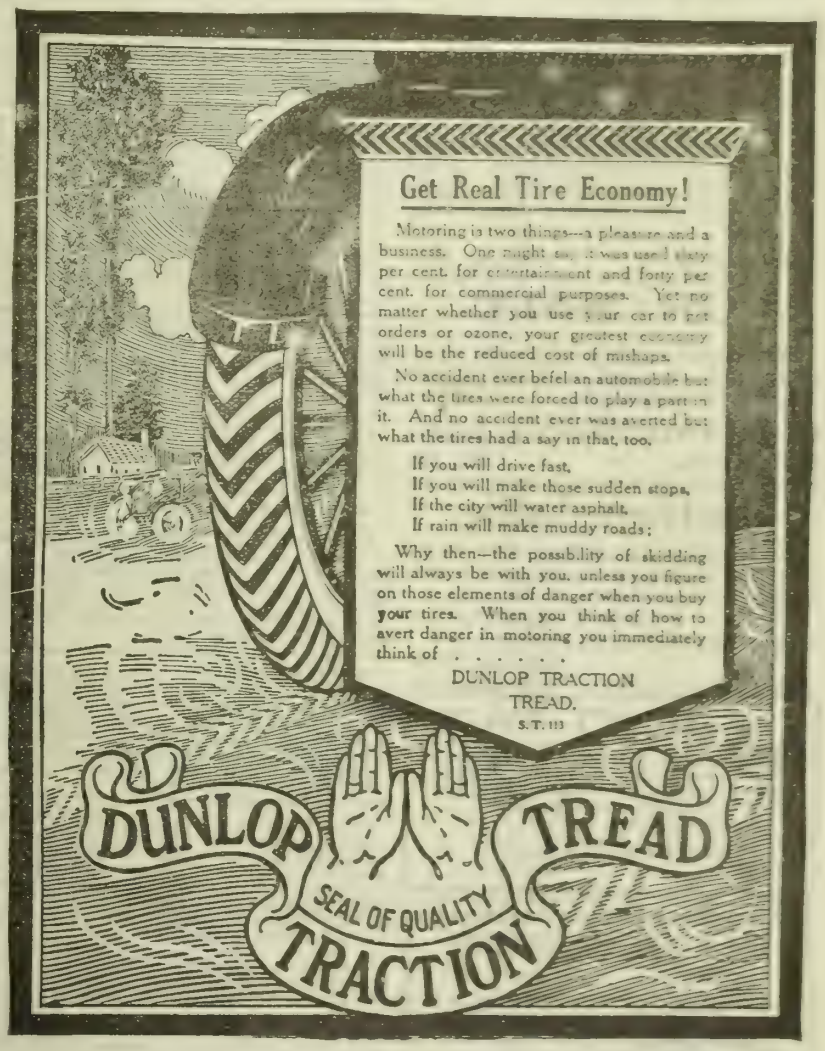
The cultivation of vegetables is easy and agreeable, and in the days when meat, eggs, milk and other staple articles are tending steadily to increase in price, a ider use of vegetable foods will reduce living expenses and promote health.

The best time to do garden work is early in the morning and in the evening; so that it is well to encourage the healthful habit of early retiring and early rising. If the work is done for the love of it, rather than from necessity, these hours will be the most agreeable of the day.

Garden Notes.

Vegetables are gross feeders and require a large amount of plant food to

(Continued on page 514.)



Get Real Tire Economy!
Motoring is two things—a pleasure and a business. One might say it was used sixty per cent. for entertainment and forty per cent. for commercial purposes. Yet no matter whether you use your car to get orders or ozone, your greatest economy will be the reduced cost of mishaps.
No accident ever befel an automobile but what the tires were forced to play a part in it. And no accident ever was averted but what the tires had a say in that, too.
If you will drive fast,
If you will make those sudden stops,
If the city will water asphalt,
If rain will make muddy roads;
Why then—the possibility of skidding will always be with you, unless you figure on those elements of danger when you buy your tires. When you think of how to avert danger in motoring you immediately think of . . . . . .

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

Prices reasonable for the quality.

J. H. STOCKTON, BULL'S CREEK FARM, —WOODSTOCK. N. B.

Some Hazards in Handling Gasoline

In connection with investigations regarding safety and efficiency in the use of petroleum and its products, the bureau of mines has made numerous tests of gasoline. In Technical Paper No. 127, by G. A. Burrell, are stated the hazards that may result from handling these liquids and the precautions to be observed.

Gasoline vapor mingles with the air in the same manner that water vapor does, the tmount carried depending upon the temperature of the air and the readiness with which the vapor can be obtained. If one takes the cover off a full pail of tightly enclosed gasoline and applies a match to the surface, the gasoline will flare up and burn as long as the gasoline lasts. On the other hand if one puts a few drops of gasoline in a small tightly enclosed pail, waits a few minutes and then produces a flame or electric spark, a violent explosion will likely result.

In the first case the vapor burns as fast as it comes from the gasoline and mixes with the oxygen of the air, whereas in the second case the oil vaporizes in the pail and mixes uniformly with the air to form an explosive mixture and upon ignition, explodes.

One gallon of gasoline when entirely vaporized produces about 32 cubic feet of vapor. If a lighted match could be applied to pure gasoline vapor in the absence of air, no fire or explosion would result. At ordinary temperatures air will hold from 5 to 28 per cent of gasoline vapor, depending upon the grade of gasoline. In 100 parts by volume of air and gasoline, an explosion would not take place it there were more than 6 parts of gasoline, or less than 1.4 parts. In other words the explosive range is between 1.4 and 6 per cent of vapor. One gallon of gasoline can, under ideal conditions, render 2,100 cubic feet of an explosive mixture.—H. J. Wilson, Colorado Agricultural College.

VOLUME OF INCH OF RAIN.

An inch of rain coming down on a single acre of ground would fill more than 600 barrels of 45 gallons capacity each. This amount of water would weigh more than 110 tons, or nearly a quarter of a million pounds.

BUFF ORPINGTONS

I have changed my place of residence from Amherst to Oxford Jct. N. S. and am better prepared than ever, to supply those wishing Buff Orpingtons stock or eggs, the ideal table fowl and winter layers. Our winnings at the Maritime Winter Fair against strong Competion were as follows 1st cock 1st hen 1st cockerel 1st 3rd pullet, 2nd utility Cockerels 1st & 2nd utility pullets and 1st pen.

Maple Green Farm Holsteins

To avoid inbreeding, we now offer for sale our senior herd bull "Maple Grove Mercena Mercedes," coming 5 years old; weight about 2500 lbs., active, sure and exceptionally kind. His first daughter to be officially tested made 15.46 lbs. butter in 7 days at 1 year and 11 mos.; another at 2 years and 2 mos. was making nearly 3 lbs butter per day when she met with an accident and we had to drop testing her. His dam gave 12664 lbs. milk and 568 lbs. butter at 2 yrs. old in the R.O.P., and her sister Posch Mercedes Springbank 2nd, is the Canadian Champion 4 yr. old in the R.O.P. with 22000 lbs. milk and over 800 lbs. butter in the year. We are also offering Bull and Heifer Calves sired by him and "King Lyons Colantha" and out of high-class Record of Merit and Record of Performance Dams.

For further particulars write

Production and Thrift Campaign

(Continued from page 511.)

give maximum results. Well rotted manure is the ideal garden fertilizer.

In small gardens, particularly where the soil is light, if manured and dug over in the autumn, a second diging in the spring will be advisable only of such portions as are to be devoted to such crops as cabbage, tomatoes, egg plant, lettuce. A stirring of the surface will be sufficient where beets, carrots, etc. are to be grown, and this should not take place until the time for planting and sowing arrives, as the freshly worked soil is best for both operations. It is important that soil should not be worked in too wet a condition, otherwise it will dry in lumps, and much time and labor will be necessary to repair the damage.

The secret of success with early planting of such crops as peas, beets, beans, is to sow the seed at only half the depth of later plantings. This is particularly the case on heavy soils. Seeding on light soil should always be at a slightly greater depth than on the heavy soil.

Remember that in dry weather cultivation should be continuous. When watering is necessary, it should be applied to the roots and not sprayed or sprinkled over the surface. A trench may be opened up with a hand or wheel hoe along each row, the water poured in from a pail, and the earth thrown back. In thi way two hundred feet of row may be thoroughly watered by two perons in half an hour and cultivating and watering are performed in one operation.

Good wood ahes form an excellent fertilizer for the garden. They should be applied in the spring when the land is not too wet. Sifted coal ashes will be of great benefit on heavy soil and help set free food for the plants.

Soils that have been under cultivation for some time need lime. Crops will not grow well if the soil is acid, and lime corrects acidity and liberates plant food. It should be applied broad cast early in the spring, at the rate of say, one pound to ten square feet.

Have a garden, if possible, not only for the fresh, wholesome food that can be produced but also for the pleasure of it. Plant a few flowers seed and watch them grow.

AN IDEAL TONIC

When your head is dull and heavy, your tongue furred, and you feel done-up and good for nothing, without knowing what is really the matter with you, probably all that is needed to restore you to health and vigour is a few doses of a reliable digestive tonic and stomachic remedy such as Mother Seigel's Syrup. Take it after each meal for a few days and note how beneficial is its action upon the stomach, liver and bowels—how it restores tone and healthy activity to these important organs, and by so doing enables you to gain new stores of vigour, vitality and health.

FOR THE STOMACH AND LIVER

MOTHER SEIGEL'S SYRUP

The new 1.00 size contains *three times as much* as the trial size sold at 50c per bottle.

5015

Production and Thrift

"TO win the war with the decisiveness which will ensure lasting peace, the Empire will require to put forth its full collective power in men and in money. From this viewpoint it is our true policy to augment our financial strength by multiplying our productive exertions and by exercising rigid economy, which reduces to the minimum all expenditures upon luxuries and non-essentials. Only in this way shall we be able to make good the loss caused by the withdrawal of so many of our workers from industrial activities, repair the wastage of the war, and find the funds for its continuance. It cannot be too frequently or too earnestly impressed upon our people that the heaviest burdens of the conflict still lie before us, and that industry and thrift are, for those who remain at home, supreme patriotic duties upon whose faithful fulfilment our success, and consequently our national safety, may ultimately depend."—*SIR THOMAS WHITE, Minister of Finance.*

PRODUCE MORE, SAVE MORE.
MAKE LABOUR EFFICIENT.
SAVE MATERIALS FROM WASTE.
SPEND MONEY WISELY.

LET US PRODUCE AND SAVE—

The war is now turning on a contest of all forces and resources—men, munitions, food, money. The call to all is to produce more and more. It may be necessary to work harder. The place of those who enlist must be taken by those at home, men and women, old and young. The more we produce the more we can save. Produce more on the farms and in the gardens. Save more and help to win the war.

LET US NOT WASTE OUR LABOUR—

In this war-time all labour should be directly productive or should be assisting in production. Make it as efficient as possible. If your labour is on something that can be postponed, put it off till after the war and make your labour tell now. Making war is the first business of all Canadians. Efficiency in labour is as important as efficiency in fighting.

LET US NOT WASTE MATERIALS—

Begin at home. The larger portion of salaries and wages is spent on the home—food, fuel, light, clothing. Are any of these things being wasted? $20.00 a year saved from waste in every home in Canada will more than pay the interest on a war debt of $500,000,000.

LET US SPEND OUR MONEY WISELY—

Are you spending your money to the best advantage? What do you think of extravagance in war time? Tens of thousands of Canadians are daily risking their lives for us at home. Is it not our duty to be careful and economical? Canadian dollars are an important part of the war equipment. Make them tell. Have a War Savings Account. Buy a War Bond.

The Present Opportunity for Canadian Stockmen

By John Bright, Dominion Live Stock Commissioner

A study of the live stock situation of the world at the present time cannot fail to convince any practical person that Canadian stockmen will have, in the immediate future, an exceptional opportunity for profitable trade. The question as yet unanswered is whether they will realize the situation in time so to conduct their operations as to take the fullest advantage of it. This is a matter of the utmost importance, not only from the standpoint of the individual farmer, but also from a national standpoint.

While the national phase of the question may lie somewhat outside of the consideration of the average farmer, the matter of personal profit may be depended upon to make its own appeal. In considering the latter aspect of the case the stockman who is convinced that an unprecedented opportunity is presenting itself to develop the live stock business of Canada, should not lose sight of the essential factors that will make such development possible. The most important of these factors are:—

(1) The lay of the foundation now by breeding stock;

(2) Improvement in the quality of live stock products by intelligent breeding—the use of good sires, the weeding out of all scrubs both male and female, consistent adherence to one breed, early castration of calves and of lambs;

(3) Improvement in the care and feeding of young animals and improvement in the finishing of animals for market;

(4) The providing of a steady volume of trade by remaining continuously in the ranks of the live stock producers despite temporary and sometimes discouraging fluctuations in price as governed by the world's demand for live stock products.

Until the last two or three years, Canadian farmers have annually allowed useful female breeding stock, particularly cows and heifers, to go to market in large numbers. While the rising prices of meats have checked this movement of late years, it must be admitted that, even yet, at certain seasons of the year, there may be seen on any of our large markets females of good type and with many years of usefulness ahead of them. The country cannot afford to lose such animals at the present time and the prevention of their slaughter is one of the first and most important steps to be taken in conserving our breeding stock. Similarly, for many years, the high prices ruling for veal resulted in annually increasing receipts for calves on the live stock markets. While male calves of dairy blood formed a considerable percentage of such receipts, unfortunately many excellent calves, both male and female, of good beef type, were slaughtered. The loss to the breeding herds and to the feeders' stalls was serious, and we are even yet feeling the effects of this sacrifice of potential beef, despite the fact that during the last two or three years there has been a marked falling off in the offerings of good calves. The prevention of such sacrifices entirely will mark the second and supplementary step necessary to the conservation of our breeding stock.

While it is true that in many parts of Canada our live stock shows the evidence of careful consistent breeding, there is a very considerable area both in newer sections of the West and in the rougher sections of the older provinces in which no improvement in quality has been effected in years. Further, it is unfortunately the case that in some districts in the West the quality of the cattle is already showing signs of deterioration, owing to the practice of foreign settlers of allowing scrub bulls and uncastrated yearlings to run with the herds. The importance of using only good sires is appreciated by a very large percentage of our farmers, but unfortunately such sires are not always used intelligently. Even in sections in which associations have been formed for the purpose of improving the live stock of the district, the practice of breeding to a sire of one breed for two or three years and then changing to a sire of another breed has been followed, with the natural result that practically no progress has been made. It has been well said hat the average Canadian farmer is less conservative on the question of the breed of the live stock raised on his farm than any other question relating to his operations. It is time the fact was more generally realized that real progress can be made only by consistently sticking to one breed, by using the best sires obtainable in that breed, and by systematically discarding females that do not prove their usefulness as breeders of animals of good type. Quality, which depends in the first place upon good blood, is one of the most important considerations in live stock breeding and has an important bearing on the price ultimately realized for the product when turned into meat.

It does not require a very intimate knowledge of the methods followed in handling live stock on the farms of Canada to enable one to realize that too many farmers do not appreciate the importance of the first year, or of the first few months, as the case may be, in the life of a young animal. It cannot be expected that a calf, no matter how well bred, is going to develop into a well-grown breeding animal or into a profitable feeder if it has been allowed to practically raise itself during the first year of its life. In fact, in many of the more backward districts it would appear that money invested in well-bred stock would be practically a total loss until the farmers are educated to feed and care for the offspring properly and to give them a chance to develop. There are many sections to which, of course, the foregoing remarks do not apply, but the improvement that would be effected in our total annual live stock receipts by the more general practice of properly feeding young animals would be remarkable. It may be added that even in some of our better districts the cattle sent to market lack finish, and only an exceedingly small percentage of our heavy steers would be suitable for the British market. In addition, the number of cattle sent out of the country in an unfinished condition as stockers and feeders last year was deplorable, particularly in view of the fact that never were larger quantities of feed available. Herein lies one of the most important questions to be solved in connection with the increase of our beef production.

The importance of renewed exertion on the part of Canadian stockmen during 1916 cannot be overestimated, and it is unnecessary to state that the Department of Agriculture, through the Live Stock Branch, stands prepared to support such efforts both by policies at present in operation and by those that may later be inaugurated.

The Empires Share in the Meat Trade.

In Australia there are about forty freezing works with the exportable surplus from 11,000,000 head of cattle and 80,500,000 sheep and lambs.

There are in New Zealand no fewer than forty freezing works, in operation or in course of construction, to deal with the exportable surplus from 25,000,000 sheep and lambs and about 2,000,000 head of cattle.

Australia and New Zealand are practically the only regular and reliable sources of supply within the Empire, and they together furnished only 284,056 tons of meat in 1915, out of 664,508 imported into the United Kingdom. In addition, there was a small import from Canada, and a still smaller import from South Africa. The Overseas Dominions should be equipped to furnish much more than one-half of the meat imports of Great Britain.

It is in the interests of the Empire that everything possible should be done to foster the Canadian Live Stock industry. In Canada the number of cattle is about 6,000,000, besides 2,000,000 sheep—a total which, having regard to the population of the Dominion, does not at present leave a very large margin for export. With the probability of preferential trade in food within the Empire there are great possibilities in the expansion of Canadian live stock production.

Imports by the United Kingdom

	1913 Tons	1914 Tons	1915 Tons
Beef, Mutton and Lamb—			
Importations into United Kingdom from foreign countries	447,433	407,856	374,534
Importations into United Kingdom within the United Kingdom	273,228	286,609	289,974
	720,661	694,465	664,508
Beef only—			
Importations into United Kingdom from foreign countries	380,135	340,525	325,453
Importations into United Kingdom within the Empire	79,909	101,440	104,967
	460,044	441,965	430,420

Have you ever asked yourself why it is that live stock breeders who patronized the advertising columns of the Maritime Farmer ten to twenty years ago are still using this medium to let the public know what they have to offer? There is only one reply. They have tried the columns of the Maritime Farmer, and they have not been found wanting. Ads in the Maritime Farmer bring inquiries from the class of farmers who are ready to buy and pay for good live stock. After you get inquiries it is up to you to make the sale—and you will, if you have the right kind to offer. Try an ad in our columns and prove if for yourself.

The Growing, Handling and Marketing of Potatoes

Address at the New Brunswick Potato Growers Convention by Guy G. Porter, Perth, N.B.

Two dominant factors which have helped this province to the enviable position it now occupies as the banner Potato Province of Canada are, undoubtedly, our suitable climate and soil. Neither climate nor soil without hard work will produce potatoes, and hard work, unless properly directed and coupled with scientific knowledge, diligently applied, will not produce the results we are striving for.

Second—Selection of Seed and Ground:

All will admit that it is very necessary to select the seed with the most of care, being sure to use nothing but sound tubers of medium size, free from all diseases. Then, again, it is very important that good, clean ground be selected, in which there are no contagious diseases carried over from season to season. With proper attention to these two important factors, your potato crop will have been started under favorable conditions.

Third—Cultivation and Care While Growing:

It is gratifying to know that in recent years spraying with a proper Bordeaux Mixture has become very prevalent, and that the results from thorough spraying are showing big profits in the way of increased yields and better quality. Improvement in quality is just as necessary as increase in yield, and I am strongly convinced that only as long as we produce the best quality of potatoes possible with all our advantages of soil and climate will we be able to hold first place in the potato industry in Canada.

Fourth—Digging and Delivery to Shippers:

Experience has shown me that nearly ten per cent of the entire potato crop of New Brunswick is spoiled by rough handling between the field and the shipper's warehouse. Many farmers handle their stock so roughly that the entire value of their crop depreciates ten per cent from bruises, cuts, cracks, etc., which later develop deterioration. By rough handling the nice, smooth, sound appearance is lost when the potatoes are delivered at the buying points. Estimating the potato crop at ten million bushels, and estimating this crop at the low price of 25 cents per bushel, the farmers are losing two hundred and fifty thousand dollars annually by rough handling. This amount of money which is lost through carelessness would pay the expense of selling the entire crop under proper organization, and would net the province a quarter of a million dollars annually. Farmers, handle your potatoes as you would fruit! They are worth just as much as oranges today. I would like to see the government, or some association of shippers or growers, prepare a pamphlet from time to time, to be distributed among the farmers as well as the shippers, educating both farmers and shippers how the potato crop should be handled. The potato crop is one which can be raised most profitbaly in this province, providing the waste in raising and marketing could be eliminated. This waste, if converted into dollars and cents, would pay the interest on the debt of the province every year. It is therefore most important, especially at this time of general economizing, that both farmers and shippers learn something about economy in the handling of their potatoes.

Again, in the buying of stock by the shippers there is very little effort to try and improve the standard of quality. The shipper, as a rule, buys indiscriminately everything that is hauled to his warehouse. He seems to work on the idea that it does not pay to be too particular about quality, fearing that he may drive his customer to some other shipper who would accept the poor quality without protest. He overlooks the fact that in accepting a load of poor potatoes he does an injury to the farmer who is bringing to market first-class stock. He dumps them all in the car together, and as a result the good stock, that should have graded No. 1, is mixed with the poor stock, which would grade No. 2, and the result is the whole car will grade nothing better than No. 2.

Although the growing end and the shipping end of the potato business are separate and apart in every way—so much so that the growers usually take all the profit and the shipper all the loss—still the interests of the potato growers and shippers are so interlocked that the closest co-operation concerning quality would undoubtedly be of advantage to both. Interlocked with their interests, again, are those of the buyer, and indirectly the consumer, the man who puts the butter on your bread.

I believe we should adopt a set of grading rules and a standard of quality. It it is now, ninety per cent of the cars we ship grade No. 2, and we are getting the No. 2 price in consequence of the lack of organization among growers and shippers. No. 1 stock should be potatoes of a medium size thoroughly screened, free from rots, cuts, and bruises. No. 2 stock should be a little smaller than medium and would also include the large rough stock and potatoes that are only slightly bruised or cut. No. 3 stock should never leave the farm, as its commercial value is not as great as its feeding value. I have seen potatoes from every province in Canada, and can say without hesitation that our potatoes are in a class by themselves, but in the grading and packing we are a century behind the times.

As an illustration, let us take the apple crop of Ontario. A few years ago the farmers used to sell their apples in bulk. They were sent to market in carload lots in bulk, and shoveled up with a fork. They sold for a dollar a barrel. One enterprising firm undertook to put up a quality brand in bushel boxes. The neighbors laughed themselves into a hemorrhage when they figured how much the boxes cost, but when they saw this firm get as much for a bushel as they did for a barrel they thought there must be something in it, and development along this line was rapid. Now we find that all Ontario apples are shipped in bushel boxes or barrels, bearing a standard of quality No. 1, No. 2, or No. 3, as the case may be. If a shipper sends in a barrel marked "No. 1" and it contains some No. 3's, the fine is $50.00 and costs. We see only about one case a year where a shipper gets fined. They have got accustomed to living up to the standard of quality and it comes easy to them now. Why? Simply because they get $3.00 for No. 1's, $2.00 for No. 2's, and $1.00 for No. 3's.

When they dumped everything in a box car in bulk, as we are doing with our potatoes today, their orchards were growing up in weeds. The farmers would not pick the apples, but shook the trees and let the hogs in; these wasteful methods are things of the past; they have been educated to market their crop in a more profitable manner. Old orchards are being restored and orchard land has increased in value from two to four hundred per cent.

We are today in the same shape as the Ontario apple growers were forty years ago. The waste each year from not having a standard of quality is criminal. Our potato crop is not bringing more than fifty per cent of its real value, simply because we have no standard of quality, no grading regulations—in fact, no efficient organization behind the potato industry. If we had grading regulations and a standard of quality to live up to, backed up by organized control, either government or association, it would be but a short time before seventy-five per cent of our entire crop would grade No. 1. The farmers would know that bruised and small potatoes would not sell to advantage, and would take more care in handling their crop. Each farmer would do his best to market his crop under No. 1 classification, and in a very short time New Brunswick potatoes would be known in all the markets of the world as "The Best."

If this grading of potatoes were carried out, the crop would bring hundreds of thousands of dollars more every year to the farmers of this province, and the value of their farms would increase by leaps and bounds. Our competitors in every province would get so little demand for their potatoes that they would quit the potato business and go in for other lines. The potato would soon be the most important crop of the province, and New Brunswick would continue to grow in prominence on the map of North America. We must take advantage of our opportunities. We must take better care of our stock. We must grade and pack our potatoes better, so that we will have the best to offer on any market that requires our goods.

I do not believe you can educate a farmer or a shipper through sentiment, friendship, or politics; the only way to appeal to them is through their pocketbooks—show them how it will be to their dvantage to grow and grade their stock in the proper manner, just as the apple growers of Ontario were shown. If this is done, both growers and shippers will become rich, standards of quality will be maintained, and progress will be rapid. I also believe we should abandon the practice of shipping in bulk. Our potatoes should be graded, put up in either bags or barrels, and marked No. 1 or No. 2, as the case may be. If this were done, we would be able to market our stock to much better advantage.

Fifth—Marketing the Crop:

Developing the market for our goods, and the intelligent distribution of the crop upon the different markets at a good price, is perhaps the most important feature of the business. This means constant scrutiny of the forces that tend to boost or break the market. There are many methods employed by the different shippers in this province in marketing their goods, but I believe the best and only practical way to market our potatoes is through a reliable representative, located in the larger selling centres, who are able to keep their fingers on the pulse of the market every hour of the day and report faithfully by wire to their shippers daily.

It is very important that markets are not allowed to become overstocked and in this connection I want to very strongly discourage the idea of consigning potatoes to Montreal, Toronto, or any other market unsold. Sometimes this can be done at a profit, but nine cases out of ten results are disappointing and sometimes disastrous. I know of many cases where shippers rely almost entirely on shipping on consignment basis to their brokers. These goods are shipped to the different markets, mostly Montreal and Toronto, without even first finding out whether the market requires these potatoes, or if they can be sold at a profit upon arrival.

I have known of many cases where brokers made no effort whatever to market the goods at the best price obtainable. They simply accepted the first offer they received, and in many cases secured the brokerage from the shipper and also from the buyer for giving them the first bid on the car. This is one of the features we have to contend with, as this practice tends largely to keep the market in a very unhealthy considtion, besides losing money for the shippers.

I also know of cases where brokers have sold dozens of cars at five to ten cents less than the market price in order to get them off his hands at a time when he was receiving a large shipment of apples; the apple deal meant a whole lot more profit to him than the commission he was making on the potatoes. Therefore the sacrifice was made at the expense of the potato shipper who consigned his stock. The average broker has very little interest in the market, other than to sell as many cars as possible in order to secure his commission. It is easier for him to sell five or ten cents below the market at the expense of the shipper.

Another feature we have to contend with, and one of the most unbusinesslike methods any shipper can adopt, is price cutting. The shipper will often load a car of potatoes not knowing when or where he will be able to sell. If by chance he should make a sale while loading, everything goes well; but this is not easily done. He holds the car on the track for a few days; perhaps the weather is cold; he becomes overanxious to sell, and begins wiring several buyers in Montreal and Toronto. If he cannot sell at his price the first day, he cuts the price five cents per bag the second day, and keeps on cutting the price until the sale is made. This is poor business, and not only affects the profits of the shipper who sold low, but every shipper in the business. It has a very demoralizing effect upon the market, and other shippers are forced to reduce their price on shipments going forward the same week in order to hold their customers.

I knew of a case where a New Brunswick shipper, after holding a loaded car on the track for five days, wired 27 different buyers in Montreal and Toronto, quoting at five cents per bag below the market, at a time when the market was overstocked and when Montreal and Toronto buyers were led to believe that there were 27 cars loaded in New Brunswick begging for a sale, whereas in fact there was only one. This indeed has a very demoralizing effect upon the market, and is a practice which should not be employed.

We all know that we cannot undersell one another and make a profit, and we all know that if we sell without profit, or without a sufficient profit to cover all contingencies, there is only one end, and that is FAILURE. There is still a good deal of sentiment in business; there always has been, and there always will be. Individual buyers will show preference to individual shippers, and cutting prices will not result in making sales.

In case of a car arriving in doubtful condition, or in case a car is shipped to a shady buyer who reports the car has arrived in bad condition, we should have our representative within easy reach of the car, and in this connection I might mention an incident that happened last fall, when a Western Ontario buyer wired the

shipper, offering $50.00 less, claiming the car had arrived in bad condition. The card index in the office showed a complete record of outturn of all the cars unloaded by this man during the last eight years. The details of loading were checked up and found to be O. K. The matter was taken up by wire with the nearest representative. The agent travelled all night, and the next morning the wholesaler came out on the sidewalk to see a strange customer tear open a bag of potatoes and dig into it like a terrier.

"Pretty nice lot of stock, that," said the stranger, looking up.

"The finest I ever saw," the wholesaler replied.

"In that case, I reckon they are worth all you agreed to pay for them." The agent grinned, handing his card to the astonished dealer. "Now, just add this to the bill," he continued, making a memo of his expenses covering the round trip of 200 miles, "and let me have a certified cheque for the amount. "I want to catch the next train back to Toronto." He got the cheque.

Another of the forces which tends to break the market is the unreliable broker. He tells his customer that he cannot sell below a certain price, but promises to report the car 10 bags short in order to make the price meet the bid of the buyer. We find numerous cases where a broker has made cuts of 10 to 20 bags per car in order to make sales at the price he was authorized to sell at. The potatoes being shipped in bulk, it is easy to report the car short. This makes bitter and very hard competition for a reliable firm to compete against, and it also makes it had for the reliable wholesaler to operate at a profit when he pays for all he gets in the car and his competing neighbor gets 20 bags for nothing This has not only been done once, but is growing to be a habit with some of our unreliable brokers, nd probably some of you shippers are wondering why your cars turn out short when unloaded.

I had an opportunity of discussing the potato situation with an agent of the Eastern Shore of Virginia Exchange last summer, and learned a great deal about their methods of selling, shipping, etc. From the very first, the founders of this wonderful organiztion had certain ideas to carry out for the benefit of the farmer and the consumer. The first thing they did was to set a standard of quality; and in order to maintain this standard they had inspectors at each of the 47 buying stations. If a farmer brought in potatoes that were poorly sorted or affected with rot, they were sorted over at the farmer's expense; potatoes that were not worthy of the brand of No. 1 or No. 2 stock were sent back to the pigs; nothing reached the market except good No. 1 or No. 2 stock. This firm sold 15,000 cars of potatoes last season; terms, sight draft by the buyer's bank before the car left Virginia. This buying sight unseen, as the boys used to say, means confidence in the seller and confidence in the quality of the goods. These potatoes were all put up in barrels of 165 lbs. net.

How many potatoes could the New Brunswick shippers sell on these terms? Not a single car. Why? Simply because we are years and years behind the times in the grading and packing of this most profitable commodity. We have no fixed standard of quality.

I feel that we should follow the rules and customs of those who have made a success of the potato business. We should sell our potatoes in barrels or bags, graded No. 1 or No. 2. By this method we would cut out all shortages by demanding of the railway companies a clear bill of lading, showing the number of bags or barrels contained in the car. We are surely entitled to a receipt from transportation companies for the number of packages we entust to their care. By this method unreliable brokers and buyers would not be able to make dishonest profits by reporting shortages at the expense of the shipper.

I have never seen a car of bulk potatoes shipped from Virginia, yet they have the largest and strongest potato shipping organization in America Neither have I ever heard of a car of Red Star Virginia potatoes being refused, or short in weight. Red Star Virginia potates bring 25 to 50 cents more per barrel than potatoes grown from similar seed in other states. The land of Virginia farmer has doubled in value. These farmers would not think of going back to the antiquated methods of selling ungraded stock in bulk. Their pocketbooks show them the wisdom of doing business under modern methods. We should profit by their experience.

I am, therefore, strongly in favor of shipping potatoes in packages, either bags or barrels of regulation weight.

The crop of the province must be kept under control and fed out to the different markets as required; otherwise we will have congested markets, bad slumps in prices, demoralization in the trade generally, with much uncertainty attending both the raising and shipping of potatoes.

I have in mind a plan whereby the cutting and slashing of prices, to the disadvantage of both grower and shipper, could be eliminated. From what we might call the New Brunswick Potato Growers and Shippers' Association having its head office located in the centre of the potato growing belt. All potato shippers to be members of this association and contribute towards the expense pro rata with the number of cars shipped. All potatoes to be sold through head office, and orders to be distributed amongst the different shipping members pro rata to the number of cars that each firm shipped during the last two seasons. All potatoes to be shipped in the name of the association, put up in packages, and graded. Each buying branch to submit its account each month to head office, to be scrutinized by auditors, and any differences of opinion to be settled by a Board of Directors. The selling price to be set by the association from day to day, based on information gained from its agents situated in the main markets on which they are operating. The buying price to be fixed from day to day after a careful study of market conditions.

If an association should be formed along these lines, the details could be easily worked out, nd by these methods we could cut down the cost of selling seventy-five per cent. We could cut out ninety-five per cent of our losses from short weight, rots, rejections, pilfering, etc. We could eliminate the slashing of prices. We could put the potato business on a firm, sound basis, which under present conditions is most hazardous to both the grower and the shipper. Our markets could be kept in a good, healthy condition so as to ensure both grower and shipper good prices for the season's crop. It is simply a problem of "He who serves best profits most."

A Successful Octegenarian Farmeress

By J. A. Macdonald, Hermanville, P. E. I.

We have very few woman farmers on the Island; perhaps had we more, farming would be in a more advanced state. Many women are left widows and try farming for a while, only to give it up, confessing their inability to carry on the work. Many widows, after their husband's death, give up farming altogether, and abandon the place in order to take up some kind of work in the city, usually Boston.

There is one woman, however, who has not followed the usual custom and thrown up the sponge when left to work out her own salvation. Mrs. Nancy McDonald, wife of the late Herman McDonald, of Hermanville, is conducting her large farm, all by herself, for the past ten years with great success. She grows big crops every year, probably the largest crops in the neighborhood; she harvests her crops early, frequently having her harvest secured before some of her neighbors have well begun.

The secret of Mrs. McDonald's success is that she keeps plenty of hired help and is able to get her work done in time. She plows every sod in the fall, and in the spring has only to cultivate and harrow in the grain. In the early spring, when others are beginning to plow, Mrs. McDonald starts the disc harrows, and goes over the fall-plowed ground thoroughly. When all the plowed land, about 25 acres each spring, is gone over she starts seeding oats. Oats is her principal crop, and she sows an average of 80 bushels each spring. She believes in sowing oats pretty thick. She sows 4 bushels of good Island black oats per acre. She says that on her soil, which is gravelly loam and somewhat light in texture, and naturally not a rich soil, thick sowing is essential. As she uses all the oat straw for feeding, she wants the straw rather fine, which would not be the case if sown thinly. Her farm fronts on the North Shore, and the saline breezes from the Gulf St. Lawrence over the oat fields cause the straw to be relished by all the animals, even the horses.

Mrs. McDonald does not use the disc to cover the grain, but uses one or two passings of the spring-tooth and finishes up with the tooth-harrow. With all her plowing done the previous fall, she seldom takes more than three weeks in getting in the seed in the spring. Her crops are oats, barley, potatoes, and turnips. The barley crop she grows on the potato and turnip ground, nd the previous crops being well manured the barley crop is always a good one. With the barley she sows timothy only, not being able to make a success of clover. Like the oats, she believes in sowing the timothy thickly. She says that she can get only one fair crop of hay, the second being always poor, while the timothy dies out after the first year. For these reasons she has adopted A THREE YEAR ROTATION on the fields near and convenient to the barn where she grows the potatoes and turnips. After cutting one crop of hay the field is plowed up and thoroughly disced for potatoes, etc., next year. She grows no potatoes for sale, and hence only plants about two acres on account of the difficulty in getting help to dig them in the fall. She also believes in thick planting of potatoes, some five to six barrels—about 16½ bushels—of sets per acre.

She does not always use stable manure for the potatoes, but can frequently get Kelp, as the farm fronts on the seashore. She finds Kelp superior to stable manure for the potato crop. This spring Mrs. McDonald has the greater part of her potato ground "kelped" and all eady for to plant the potatoes when the proper time comes. She uses her surplus potatoes for the stock, but more particularly to boil in the fall in conjunction with barley for pig-fattening. Boiled potatoes with grain or meal is the principal food used for pig-fattening in that vicinity. It would be a pretty dear feed this spring, as potatoes are now selling for 75 to 80 cents per bushel. But large quantities of potatoes were used on the Island last fall for pig feeding notwithstanding their high price. The barley crop is also used for feeding the live stock in conjunction with the potatoes and turnips. Mrs. McDonald does not grind a bushel of her barley, but feeds it always boiled. The grinding mills, she says, only crack the grain, and do not grind it fine, and barley, she asserts, should be ground very fine for feed; and as this cannot be done, she boils it. Boiled grain of any kind is as valuable—a little more so—as very finely ground grain. This boiling of the barley and of much of the potatoes naturally involves much labor; but Mrs. McDonald, old woman though she is, does not mind hard work.

She fattens five or six pigs each summer for market, but keeps no pigs in winter. She purchases young pigs in the spring, feeds them on milk, oatmeal, and shorts. During the summer she purchases middlings and cracked corn, and forces them long on grass, milk, kitchen slops, and this meal until potato digging, after which she begins boiling the potatoes in conjunction with the barley, and forcing them to maturity at a weight of about 200 pounds deceased weight. She manages to have the pigs off her hands before cold weather sets in.

Sheep is a good side line with Mrs. McDonald. She keeps a nice flock, and she finds that the lamb crop is the easiest money of all. Last fall her lambs averaged 115 pounds at a time of sale in the fall, or $6.50 each. Wool also fetches a high price. The sheep are protected from the ravages of dogs by never leaving them in the field at night. Mrs. McDonald has taught her sheep to come to the barn every evening where they are housed. She seldom has to go to bring the sheep home. She keeps salt, water, and other encouragements to the sheep to come home. They start for the field in the morning by themselves. A lane goes down along one side of the farm, and the gates to the field in which the sheep are confined are opened so that sheep may go in or come out at will, but not cows or horses. In this way the sheep are little trouble. In winter the ewes are fed oats every day, and turnips when they can be spared. They are fed mostly on oat straw, receiving little or no hay. The flock appeared to the writer to be in fine condition, mostly grade shropshires.

A good flock of hens are also kept, and a small dairy. The surplus butter is sold at good prices, as are those prevailing in the last few years.

The hired man is a terror to most men farmers, and the majority of farmers hire as little help as they can. This old lady keeps two farm hands the year round. One man is with her over forty years, and is one of the family; the other man is a married man and lives in a cottage nearby, though he takes most of his meals at the farm. Mrs. McDonald, besides overseeing and supervising all the farm work, does all the cooking for the men. She keeps no female help of any kind, and hasn't for several years. This is

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; 3 inches—First insertion $2.25.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or

Sussex, N. B.

Toronto Representative—J. Lester Davis, Miln Building 8 Johnson Street.

Montreal Representative—Dakers Cameron, St. Nicholas Building.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

MAY 16, 1916.

DATES OF ISSUE.

June 6-20

BEAUTIFUL FARM HOMES

The planting season for trees and shrubs is now here, and it will not last long. Unfortunately it is the busy season for the farm work, too, when there seem to be dozens of things all of which ought to be done first, but we must not forget that we are human beings and that we can really starve for the beautiful sometimes without realizing it. We must have homes and we ought to have beautiful homes. Women and children, and men too, will actually love a home more if there are trees and bushes and vines to add to its charm—and the love of home is really at the root of a happy life. Looking at it from an entirely practical point of view, the money value of a place is actually increased by beautiful planting.

Put your time and money into permanent things—trees, shrubs, and perennial plants and vines. Then the work will not have to be done over each year.

The following suggestions, given by fhe Landscape Extension Department of the University of Illinois, will be helpful in planting so as to get the best effects:

"Plant trees on the border of the lawn for shade, to enframe the house, along the street for parkway effect, and on the property line to screen your neighbor's yard or to give privacy to your own. Avoid planting too closely and in straight lines. The Carolina poplar, box elder, and soft maple are too poor for ordinary use. Small trees as the red bud, flowering crabapple, and plums, used in groups of two or three in connection with shrubs, are valuable for screening.

"Keep the lawn open. Do not scatter flower beds or shrubs promiscuously. Plant shrubs about the foundation of the house, the angles of the walks, and the borders of the lawn. Use the more refined growing plants about the house and the coarser ones at the borders, where they are seen at a great distance. Use high growing shrubs at the corners of the house and porch and for accent in the wider parts of the border beds. Plant high growing species back of low growing ones. In planting close to walks and drives, use compact growing species. Do not plant shrubs as individual plants, but use several plants in a bed to secure a massed effect. Do not plant shrubs in a straight line, but place the plants irregularly so as to avoid a lined-up appearance. The side of the planting beds next the lawn should present a pleasantly curved outline.

"When getting trees and shrubs from the woods better results are to be had by collecting small specimens which will transplant easily, with small root loss. It is usually better to purchase nursery stock, which is not expensive (a tree 8 to 10 feet tall costing but one dollar) than to spend time and take the chances in collecting. Much the same can be said of shrubs. Collected shrubs are frequently 'leggy,' sparse, and of poor shape, while shrubs bought from the nursery should be bushy and compact."

Reliable seed houses advertising in the Maritime Farmer offer a list of hardy, permanent and reliable trees for the lawn, and shrubs for foundation and border planting, with the height which the shrubs attain, the time and color of bloom, whether suitable for shady places, and whether too coarse in texture for planting near the house. A list of desirable permanent vines is also given. As the Landscape Gardening Department of the University of Illinois is one of the finest in the United States, we can accept its advice as authoritative.

AS OTHERS SEE US

Under the above caption, a lady writer in The Farming Business says:

"I sometimes wonder if the woman who lives within a few block of the city stores, and who, presumably, can arrange her shopping trips for any one day in the week just as well as another, ever thinks of the fact that most farmers' wives can only come to town when the men come. This is usually on Saturday in this locality, though, of course, not every farmer's wife comes to town every Saturday. No, indeed! For many of them a trip to town is quite an event in the calendar—one to be thrice enjoyed—in anticipation, in realization, and in retrospection. Which is why I say that if the city women knew, or would stop a while to think of this condition, she would be considerate enough of the situation to plan her own shopping for some other day and leave Saturday for the salespeople to attend to the wants of their country customers.

This matter was especially brought to my attention during the last Christmas holiday season, when I saw country women who, I knew, had ridden many miles to town to do their Christmas shopping, and for whom it meant their last chance to shop before Christmas day, stand aside while the saleswoman waited on a city customer who could come again any number of times to finish her Christmas shopping.

For myself, though I belong in the class of the town dweller, and though I do sometimes go to town on little errands of Saturdays, I make it a point to notice whether I am keeping any country woman whose time may be limited from the clerk's attention.

PERFORMANCE COMES FIRST

"Handsome is as handsome does," is an old yet absolutely up-to-the-minute adage. Nevertheless, it is strangely true that such a superficial factor as the shade of color of an animal will sometimes be confused with true merit. Some well-meaning enthusiasts believe there should be a different classification in the American Standard of Perfection in Poultry for the light and dark barred Plymouth Rock strains. Others desire a separate rating for Holstein cattle in accordance with the amount of black and white they possess. The utility farmer who is striving to make a living from the performance of his hens or his cows has little use for exacting attention to these exterior qualities. The big thing to him is the number of eggs or the pounds of milk of high butter fat content that the animals will produce. The shade of the color may be secondary as a personal preference, but never of first importance, as some enthusiastic fanciers proclaim. In buying or selling animals the general farmer should never allow these points to cause confusion.

PLANTING WEAK SEED CORN

Although seed corn has tested fairly well at the Ottawa Laboratory, corn growers whose seed has not been tested would do well to take special care this season that their seed is of strong vitality. Owing to unfavorable ripening and harvest weather, some of last year's seed corn crop may be low in both percentage and vigor of germination. This seed should not be planted until the soil is warm and the weather at its best to encourage the growth of the young corn plant. The rate of seeding may be increased, but no amount of fairly weak seed is likely to give a good stand of plants unless the conditions of growth are most favorable.

WORK

Let me but do my work from day to day,
In field or forest, at desk or loom,
In roaring market-place or tranquil room;
Let me but find it my heart to say,
When vagrant wishes beckon me astray,
"This is my work—my blessing, not my doom;
Of all who live, I am the one by whom
This work can best be done in the right way."
Then shall I see it not too great, nor small,
To suit my spirit and to prove my powers;
Then shall I cheerfully greet the laboring hours,
And cheerful turn when the long shadows fall
At eventide, to play and love and rest,
Because I know for me my work is best.

—HENRY VAN DYKE.

FOOD FOR THOUGHT

Get up right in the morning. Go to bed right at night. Start with joy in your heart, hope in the future, kindness in your purpose. If it is a dark day, never mind; you will lighten it up. If it is a bright day, you will add to the brightness. Give a word of cheer, a kindly greeting and warm handshake to your friends. If you have enemies, look up, pass them by, forget and try to forgive. If all of us would only think how much of human happiness is made by ourselves, there would be less of human misery. If all of us would bear in mind that happiness is from within and not from without, there would be a well-spring of joy in every heart and the sun would shine forever. Try it!—Leslie's Weekly.

A good road between every farm and market is a reasonable and worth-while proposition.

* * *

If you intended to do a mean thing, wait until tomorrow; but if you are going to do good, do it now.

Features Gathered From the N. B. Women's Institute Reports

(Continued from last issue)

Chocolate Cove and Cumming's Cove.—Eighteen members joined at the organization meeting in July, 1914. Membership now 31. Funds in the treasury are accounted for in the following manner: $18.00 from sale; $15.00 of this went towards the Hospital Ship Fund and $3.00 to the Red Cross Society $4.00 from Birthday Party, and from this amount $5.00 helped to equip a hospital bed, $9.00 to purchase a gift for one of the soldiers from the community, and the remainder was utilized in buying Red Cross material. The sum of $10.00 was voted towards the Ambulance Fund. Twelve dollars was expended on repairing the cemeteries. Meetings are held in the hall, which necessitates paying $5.00 per year rental and 25c. a night to the janitor. The latter sum is raised by a tax of 2c. per night on each member present. Programmes are made out by a committee one month in advance, and each seems willing to do her part to make the meeting pleasant and profitable. The success of this branch is due mainly to the fact that a spirit of harmony exists among the members, each one being willing o abide by the decision of the majority. All may not be of the same mind, but each seems to realize the sound truth of the old saying: "United we stand, divided we fall."

Grand Harbor—Membership now 33, an increase of 10 over last year. Has a library of 61 volumes. Several members donated a volume and generous contributions were received from friends. A drama entitled "The Country Minister" netted $65.50 for the Institute. Doctors B. F. Johnson and J. F. Macaulay delivered instructive addresses on "Bad Air" and "Contagious Diseases." Miss Jonah, sent from the Department, gave demonstrations on Cake, Candy, and Fruit Salad. Annual reception of the Institute was a great success. The hall was prettily decorated with flags, banners etc., and a patriotic programme was carried out. Rev. J. E. Gosline gave an educational address on "What the Women's Institute Can do for the Moral Uplift of the Community." Throughout the year many members have given demonstrations in several lines of cooking. Roll call has been answered by quoting poetry and paying fees. Printed programme for the entire year much more satisfactory than planning from one meeting to another. In addition to 82 pieces given to Red Cross, one quilt was forwarded to Dr. MacLaren's hospital in France, 3 cases of clothing to the suffering Belgians, and $10.00 to the Hospital Ship Fund. Later $50.00 was forwarded towards the Ambulance Fund and $83.00 helped buy a Machine Gun.

Leverville.—Held its third annual meeting in July, 1914. Total membership now 44. August meeting held shortly after declaration of war, and Institute voted available funds for the aid of the Hospital Ship. Considerable Red Cross work accomplished, and causes. During the winter papers were read on "Scientific Housekeeping," "House Cleaning," "Cooking Turnips," and "The Education and Training and Children." Miss Jonah's demonstration on "Canning Fruit and Vegetables" was highly instructive.

Lord's Cove.—Organized August, 1914, with a membership of 9, which has since increased to 26. Mostly patriotic work. For Patriotic Fund $234.83 was solicited, and by means of suppers and donations $47.56 given to Belgian Relief. One box containing new clothing, and 13 boxes and 13 barrels containing clothing and food have also been sent to these suffering people. Plan putting improvements on building where meetings are held. This branch gave to Motor Ambulance Fund $90.20.

Pomeroy Ridge, Scotch Ridge and Gleason Road.—Organized July, 1915. At the first meeting of the Institute ice cream was sold, netting $10.35. A series of Red Cross teas has further swelled the treasury by $11.50. Total receipts to date $56.97, all of which, with the exception of $5.00, has been expended on material for sewing and knitting. Five dollars was given to the Ambulance Fund.

Salmon Beach.—Organized June, 1915. Membership 19. Programme and School Visiting Committees appointed. Ice cream socials have brought in -52.69, $20.00 going to the Ambulance Fund and the remainder to buy cotton and yarn. A box containing comforts for the soldiers was sent forward and more material purchased for future work. Out of the Institute funds, two copies of the Canadian Home Journal are taken and thoroughly enjoyed. Some subjects discussed include "Ironing Day Made Pleasant" and "The Widespread Value of Salt." This branch aims to give each member some work to do, so that each feels personally responsible for the growth and welfare of the Institute.

Stonehaven.—Organized June, 1915. with 14 members. Papers enjoyed at meetings are "Prevention and Cure of Colds," "Care of the Sick," "What is Charm?" and "Pickling." Bean supper netted $56.65, and from this sum material was bought and upwards of 100 articles made for soldiers and hospitals.

South Tetagouche.—Two monthly meetings have been held since organization, June, 1915, and the membership is 25. Social held at August meeting and collection taken up amounted to $9.45, with which Red Cross material was purchased. Interesting papers on "Bread Making" and "The Value of Women's Institutes" have been read. Eighteen articles for the soldiers have been forwarded so far.

Bass River.—Organized in July, 1915, with a membership of 15. Pleasant and profitable afternoons are spent at all meetings. Entertainment held on the evening of July 12th by the young men resulted in the proceeds being handed over to the Institute for patriotic work. Further money made at a recruiting meeting, when tea, cake and candy were sold. Discussion at one of the meetings on "Canning and Preserving of Fruit and Vegetables" was very hetpful to the many housewives present. Busily engaged in knitting for the soldiers.

Ford's Mills and Beersville.—Organized October, 1912. Roll Call is answered by 28 members, with an average attendance of about 15. All members wear the N. B. W. I. pin, and nearly all subscribe to the Canadian Home Journal. Considerable sum of money has been expended on the Agricultural Hall. Through the summer, members worked for the different needs of the soldiers, Red Cross, Patriotic Fund, etc. Ten dollars was given to the Hospital Ship Fund and two boxes containing comforts sent to the soldiers. At Christmas a musical programme and social was held in the school house, the proceeds going to the Belgian Relief Fund. At the Bean Supper held in March another substantial sum was raised for Red Cross. In order to contribute towards the Motor Ambulance Fund a Basket Social and Fancy Sale was held in the school grove in August. The Institute here has promoted sociability and work "For Home and Country" is being accomplished with united effort.

Buctouche.—At last November's meeting, a discussion on "How to Increase Our Funds" led to money being raised and disposed of in the following ways: Two concerts, one held at Buctouche and the other at Rexton, netted $159.10; of this amount $25.00 was sent to the Disablement Fund, $73.00 to the Motor Ambulance Fund, and $30.71 to assist in buying a Machine Gun. The sum of $15.50 was realized through the sale of flowers. To the Belgians were sent six boxes of clothing valued at $418.85. The remainder of funds was spent on material for the soldiers, 50 articles having already been forwarded to them. The members greatly enjoyed making a quilt for the first young lady married from the Institute, and it was no more than finished before it was needed.

Harcourt.—Fourteen members enrolled at organization meeting, July, 1915. Present membership 20, with an average attendance of 12. Special meetings held to sew and knit, and in order to buy material a tea held in July gave $45.00 for this important work. In order to further increase the funds the members divided into groups of four, each group presiding at a small tea held in the Red Cross sewing rooms every second week. These teas were quite well patronized, and the Red Cross funds considerably augmented thereby. By means of an ice cream social held in August, this branch was able to forward $22.00 for the Motor Ambulance Fund. The meetings have always been pleasant, and instructive discussions have followed papers read on such subjects as "Pickling and Preserving," "First Aid to the Injured," "Dangers of the Common Cup in School," etc. A nicely arranged programme for the year was presented by the directors at the August meeting.

Bloomfield and Central Norton.—Organized August, 1914. Membership increased from 11 to 21 members. Patriotic work confined to knitting, and 48 pairs socks forwarded so far. Meetings have been made very interesting with papers written by the members, followed by discussions and music. Some of the subjects taken up were: "Household Economy," "Butter Making," "Books Every One Should Read," "Early Planting," and "Home Nursing." Miss Jonah visited this branch in May, giving a demonstration on "Hospital Nursing in the Home," which all thoroughly enjoyed and was the means of bringing in new members

Central Greenwich.—Organized October, 1913. Membership 19, with an average attendance of 11. Members interested in patriotic work and never refuse their aid in knitting and sewing. In all, 143 articles have been sent to the soldiers and 18 children's garments to Queen Mary's Guild. By selling 100 "Allied for Right" buttons, funds further increased. Last year the programmes were printed, but to economize on the cash this year's programmes will be typewritten. Socially our meetings are worth the trouble, if we were not benefited in any other way.

Clifton.—Third annual meeting held July, 1915. Total membership 25. Roll Call is answered in various ways, such as funny stories and quotations on "Thanksgiving," "Christmas," "The New Year," "Spring," and "Patriotism." Found it an advantage to have the programmes prepared a year in advance, as it gives the members a better chance to understand the year's work. By means of a supper and sale, $35.00 was given to the Clifton Hall organ fund. At a meeting addressed by the Supervisor last winter, tickets were sold on a rug, and the proceeds together with the collection taken up amounted to $5.50, which was given to the patriotic fund. The "Allied Tea and Social" held in Clifton Hall was a great success. Small tables were arranged to represent the different nations of the allies and the young ladies waiting on the tables were costumed to correspond. The hall was decorated with flags and the photos of the brave boys having gone to the front from Clifton and vicinity. Of the $60.00 cleared, $50.00 was given to the Women's Institute Motor Ambulance Fund. Through the efforts of the young ladies, a Basket Social and Dance cleared $16.00 for the Soldiers' Disablement Fund. The members are all interested in the public schools, and at the October meeting the school teachers from the Consolidated school were invited to attend. Papers were read on "Where Home and School Meet" and "How Women, Working Collectively and Individually, May Aid the Public Schools." This meeting resulted in the members meeting certain afternoons to make cushions and rugs for the school vans. Other interesting addresses include "The Origin of Thanksgiving," "Christmas Customs in Other Lands," "School Gardening," "The Spring Garden." Programmes for this year include such subjects as "Sanitation in Home and School," "Care and Precaution in Contagious Diseases with the Board of Health Regulations," "National Ideals and Characteristics," "Music with Stories of Famous Hymns and Songs," "Woman's Work of Today," "Woman as a Citizen," and "Business Methods for Women." By selling patriotic buttons $12.55 was realized for the Motor Ambulance Fund. Through the efforts of the Institute a beacon light was placed on Clifton Wharf. Six copies of Canadian Home Journal taken by the members, and all agree it is a splendid magazine. Seventy-three pieces for Red Cross and soldiers have been completed and sent forward, and an additional bolt of grey cotton and shaker flannel have been purchased. Yarn is always kept on hand for knitting.

Corn Hill.—Organized October, 1913. Meetings have been held every month in the two years. Public meeting addressed by Mr. Andrew Elliot, of Galt, Ontario, on "The Boy in the Home," was a great success. These public meetings are a stimulus and great help in the community. Much pleasure and profit derived from exchanging visits with the Havelock Institute. Since last convention, by means of socials, etc., the sum of $158.69 has been raised. With the exception of $10.00 expended on dishes for the public hall, money has been donated to patriotic causes. On Arbour Day a number of the members visited the school and made a picnic for the children. They felt they were fully repaid for their trouble by the pleasure the children seemed to derive from feasting on the good things set before them, after working in the school garden all day. The "Girls' Meeting" in June was a grand success. The girls took charge of the programme and served refreshments. The roll call was answered by "Pointers for Girls." A "Grandmother's Meeting" was also held when old-time recitations and songs and a well-prepared paper entitled "A Mother's Duty to Herself" made up a most entertaining meeting. A luncheon of old-time cooking was served. This meeting was such a decided success the grandmothers are down for another meeting this year.

HORTICULTURE.

EVERBEARING STRAWBERRIES

Some persons are so ultraconservative they cannot realize that the world moves. They fail to grasp facts that are already settled beyond controversy. Does it ever occur to these people, I wonder, that milk, eggs, and berries—things that enter so largely into the make-up of our daily meal—were primarily not intended for human food, but simply a part of nature's scheme of reproduction? Originally, the cow gave her milk, like other animals, only until her offspring was weaned. The hen laid only eggs enough to hatch out a brood or two of chicks. But man, ever striving to divert nature's channels to his own uses, has, by process of selection, cross breeding, and high feeding, succeeded finally in developing both a cow and hen capable of administering to his diet throughout practically the entire year.

Similarly, the fruit of the strawberry plant was but nature's device for perpetrating itself, in having its seed scattered broadcast by the birds that fed upon it. But here again man stepped in and appropriated it unto himself. Improving the berry in many ways, he has nevertheless been completely baffled in endeavoring to prolong—as in the case of cow and hen—its all too short period of fruit production until nature came to the rescue.

The miracle was brought about presumably through the medium of some tiny insect, injecting into the blossom of a cultivated strawberry plant of Samuel Cooper, at Delvan, N. Y., pollen obtained from some hardy little berry of field or wood. From the seed of this hybrid was developed the nucleus of a race of Everbears destined to revolutionize the fruit markets of the world. It is not generally understood as yet that these Everbearers not only bear throughout the entire growing season from June till ground freezes in the fall, but that they yield an abundance of fruit the year they are planted, requiring but three months to reach maturity, instead of a full year, as with the common varieties.

Even the unconvinced are compelled to admit that the flavor of these berries equals the choicest of the "June-onlies." Another established fact is that frost and drouth have scarcely any perceptible effect with them. Were it otherwise they could not continue fruiting way in full blast as they do during the dry months of the summer, nor well along in autumn until the ground is actually frozen.

There are croakers and doubters, of course. These, like the poor, we must always expect to have among us; and others, too, that never succeed at anything they undertake; but all will come around in due time and fall into line as soon as plants enough can be secured to supply all comers. Growers will then probably have nothing else to offer, and why should they? The improved Everbearer possess every virtue of the common berries that fruit only in June, and so many more in addition that the present scarcity of the former is the sole excuse for the existence of the latter.

Reverting again to the cow and hen, one must bear in mind that to obtain the results accomplished high feeding is an absolute necessity. Were these creatures allowed to relapse again to their wild state—to cow to browse on leaves and dead grasses, and the hen dependent for her food upon what stray insects and weed seed she could find—the yield if milk and eggs would diminish very rapidly.

The same applies precisely to the Everbearer. This feature is often overlooked, with its consequent disappointments. To get satisfactory results, they cannot be treated with impunity, as many do their common berry plants. Planted in the same rich soil, and given the same culture as celery and asparagus, and the yield will be beyond all expectations.

The seemingly extravagant things that have been from time to time written of these wonderful plants are mostly true, but people having been fooled so often in the past with nature-faking novelties, it is not surprising that the average man is slow in appreciating the value of his new inheritance. Perhaps it is as well so, for otherwise the price of the Everbearers would have risen to such a fabulous figure that none but the well-to-do could have secured them.—C. S. Kempton, in New England Homestead.

DUSTING FRUIT TREES

I was much impressed with the address delivered on "Dusting Fruit Trees" by Professor Reddick, of Cornell Agricultural College, before the New York Fruit Growers' Association this year. Professor Reddick stated that after five years' experimenting with the dusting of fruit trees for scab and insects affecting the fruit and foliage, he was convinced that as good results could be obtained as by spraying the trees with liquid sprays. The expense of treating an orchard in this way is about equal to that of the common method of spraying. Two men and one horse can dust thirty acres a day of full-grown Baldwin trees. In this way a great saving of time is effected, besides getting the poison on the tree at just the proper time.

Dusting machines can be attached to an ordinary spray pump engine, and are offered by many manufacturers at prices ranging from $25 to $120. Up to the present I understand that they have not been able to produce a dust that would be of sufficient strength to destroy San Jose scale or Oyster Shell scale, but Professor Reddick intimated that he hoped to obtain a dust which would be equal to such demands.

The material used in dusting is, I understand, composed of sulphur, arsenate of lead, and gypsum, which is ground into a fine dust that will pass through a two-hundred-mesh sieve. This mixture is blown out through a pipe, and floats away like smoke through the air, and if applied on the wind side of a tree will thoroughly cover it.

It was the general impression among the fruit growers at the New York convention that the dusting of orchards may in time do away with the liquid spraying of trees, particularly in orchards not affected with scale. I would, however, advise the fruit growers of Canada that they stick to the old and thoroughly tried sprays until our Canadian Experiment Stations have proved that dusting is satisfactory under all climatic conditions.—D. Johnson, Dominion Fruit Commissioner, Ottawa.

TWO FRUIT PESTS TO WATCH FOR

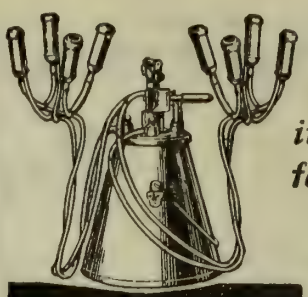
Last year I warned the fruit growers of Nova Scotia of a widespread outbreak of Canker Worm, which would damage many orchards in the spring of 1916—that warning was based on the reports of our brown-tail moth inspectors. This year reports from the same men say that the infestation is increasing, and that a great amount of damage will be done this spring. Some few owners have already applied tanglefoot bands. Where these bands were not applied, very thorough spraying in 1916 is all that can now be depended upon to control Canker Worm. If you saw any number of light grey moths about the trunks of your trees last November, you can depend upon it that they will eat more or less of the leaves from your trees this spring, and cause you some loss.

In regard to spraying for Canker Worm, we, of course, all know what a hard insect it is to poison. When more than half grown it apparently thrives on arsenic; so in order to control it we must have the leaves thoroughly coated with poison when it emerges from the egg and begins feeding, for it is then comparatively easy to kill. Most of the Canker Worms emerge about five days before the blossoms show pink, so if your orchard is infested put on the pink bud or second spray a couple of days earlier than usual, or else retard your semi-dormant or first spray until the leaf is as large as a twenty-five cent piece, using in both sprays a larger quantity of poison than usual.

The present outbreak is wide, covering the whole Annapolis Valley, and in a general way only the orchards that have been heavily sprayed for the past two years are in any way free from them.

Tussock Moth

We are now on the eve of another outbreak also of Tussock Moths. Inspection has shown this outbreak to be widespread, probably heavier in the West end of the Annapolis Valley than in the East. The Tussock Moth was particularly bad in the East end of the valley in 1906; the next outbreak in 1912 did not affect the valley so much. This present outbreak will damage a few orchards in 1916, but will not reach its height until 1917. In one orchard this year I found a large amount of fruit disfigured by the feeding of the larvae. The injury might, at first glance, be mistaken for that of the Fruit Worm, but the feeding is



"Would not be without it at double the price.—Cows fall in love with it"

That is the way M. C. W. Kay of Sussex, N.B., sums up his experience with the

EMPIRE MECHANICAL MILKER

Gentlemen: August 17th, 1915.

Replying to your query about the milking machine you have installed in my barn, I beg to say that same is working to my entire satisfaction. It does all that you claim for it. I find that all the cows that had sore teats before using the machine are now all right. The cows just fall in love with it and I would not be without it at double the price it cost. I will be pleased to reply to any one you may refer to me and help them solve their labor problem. Thanking you for the courteous treatment you have given me, I am,

Yours truly, M. C. W. KAY.

GROW STRAWBERRIES

Strawberries are the first money crop of the year, and bring in the cash at a time when cash is much appreciated. Let the young people on a farm look after this crop, for besides the profit, there is real joy in growing Strawberries. Have your boys get a practical start in business farming by keeping cost accounts on an acre of berries. Let them compare the profits on that acre with acres in other crops. Their figures may give you a surprise too.

Our plants are grown on deep soil, this means good roots, and are carefully dug and packed to reach you in perfect condition for planting. The most popular variety grown in the Maritime Provinces is the Senator Dunlap. Our Dunlaps, $3.50 a thousand. In orders of 5000 or over, $3 25 a thousand. Other varieties Sample, Ophelia, Arnout, Williams, etc. Send for Catalogue.

Butter Parchment at Farmer Office, Sussex

done later and does not heal out so perfectly. The apple is seldom deformed, the edge of the eaten areas are irregular, often extending irregularly over half of the apple.

The eggs of the Tussock Moth were deposited by the female about August 30, about 150 eggs in a cluster, on the old pupa case, and covered with a frosting or froth to protect them. They may be found on any part of the tree, usually on the fruit spurs of the apple. The young larvae will emerge during the last week of June and feed for two or three weeks on apple leaves, later feeding on the fruit to a certain extent. In order to control Tussock Moth we must put poison into our last summer spray, or that going on during the last week of June. If the eggs of the Tussock Moth are in any way numerous in an orchard, it would pay to put in a larger quantity of poison than usual in the last spray.—G. E. Sanders, Entomological Division, Annapolis Royal, N. S.

HOW THE CHINESE FARMERS PRODUCE CELERY

Since early in November the Chinese farmers have been shipping a lot of fine celery from their small farms near Palo Alto, Cal. So fine is their product that it has become the standard for the San Francisco market. Just outside the city these Celestial farmers have their farms located. The soil is a heavy black loam, much the same as the gumbo in the South and in the valley of the Missouri River. In this rank soil the celery thrives.

Michigan and Colorado produce fine crops; in the southern part of California there are extensive fields. That grown in the fields of the middle west is fine as to flavor, crispness and general good qualities, but it is much smaller than the California products. Each stalk or head produced in the Palo Alto fields will average two and two-quarter pounds in weight. Every week during the shipping season about forty-eight tons of celery have been shipped to the San Francisco market and in addition the local market has been supplied. Returns to the Chinese companies have been about $550 a week, the total for the season being nearly $10,000 from a comparatively small area under cultivation—less than ten acres.

The reason why the Chinese seem to have a monopoly of this line of farming is that white men are averse to working in the damp, mucky soil necessary for the plant. When working among the plants it is necessary to wear rubber boots or go barefoot on account of the dampness, but the Chinese seem to like this sort of thing.

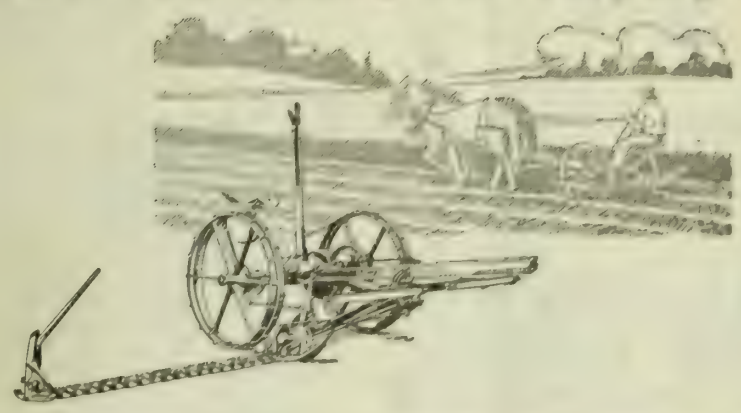
The method of growing is different from that followed in the eastern part of the country. At the start the plan is the same. Small plants are first grown in boxes. From these they are transplanted early in the growing season to the maturing bed, made up of a series of trenches. In Michigan these trenches are about two feet deep and as the plants develop the trenches are filled in, the plants hilled up, the result being that the mature celery is beautifully bleached and is very tender. When it comes to harvesting, a great deal of digging is necessary, which adds to the cost.

But the Chinese dig no trenches. They set the plants out not more than six inches apart and on a fairly level field. As the plants develop in size, the farmer binds loosely around each one a cylinder of matting varying in height from six to twelve inches. As the plant grows it fills the matting casing and when the leaves reach above it the growth is so dense that sunlight scarcely can penetrate between plants either in the same or adjoining rows. Bleaching results as a matter of course, and likewise the necessary tenderness, crispness and flavor are retained. The harvesting is a much easier process, because the plants can be cut off just below the surface of the ground, obviating all work of excavation necessary with the trench plan.

It takes an abundant supply of water for celery In getting this necessary supply the Chinese have shown ready adaptation to modern methods. At the Palo Alto fields they have sunk a deep well, and water therefrom is pumped by electric power into flumes that convey the fluid to the fields.

Naturally their success has attracted considerable attention. Buyers from San Francisco come down and bargain for the standing crops, so there is not the slightest possibility of not finding a market. A larger tract than that already occupied by the present farmers has been subdivided, and this year will be farmed by several other companies.

Are You Ready for Haying?



Are you all ready to make the most of this year's hay crop? Are your mowers, rakes, side delivery rakes and loaders all ready to do a good season's work? Look them over now while there is still time to get repairs or to get new machines before the crop is ready to cut.

If you need new machines, don't fail to call on the McCormick local agent before you buy and see the McCormick mowers, dump rakes, side delivery rakes and loaders. There are features in McCormick haying machines that save work and make money for you. The all-steel side delivery rakes and steel-frame hay loaders are two of them. Don't fail to see them.

Don't take chances with imitation repair parts for your McCormick machines. Get the genuine. Then you are safe, because there is no difference in size, shape, or quality between McCormick repairs and the same parts on new McCormick machines.

The McCormick local agent has some specially good hay tools for you to use this year. Drop in and see him, or write to us at the nearest branch house for full information.

VEGETABLES WORTH TRYING

Celeriac and hamburg parsley are vegetables not commonly seen in the home garden. Both are well worth raising and should have a place along with the beets, carrots, and parsnips. Celeriac is known as turnip-rooted celery and is grown in much the same way as celery, except that no blanching is necessary. Seed should be sown in a seed bed and transplanted to the permanent rows, allowing the plants to stand six inches apart. Any one who cares for celery will find this an agreeable addition to various soups and stews. Large Smooth Prague is the variety most commonly grown.

Hamburg parsley produces a root that resembles a small parsnip. It should be planted early in the spring in a deep rich soil. Soak the seed in warm water for a few hours, as all varieties of parsley seed are slow to germinate unless this is done. Thin the plants to stand four inches apart in a row. Both of these vegetables are quite free from insect enemies. Hamburg parsley, like celeriac, is largely used as a flavoring for soups. Both of these vegetables keep well through the winter if taken up and stored in dry sand in the cellar—C. H. Chesley.

SEED POTATOES

The right kind of potatoes bring better prices than the wrong kind, and the right kind can usually be grown with very little added trouble. The right kind is the kind the public wants.

The way to grow them is to plant the kind of potatoes you wish to grow. This means careful selection from the hills, observing the following rules:

Select only from hills in which a larger part of the potatoes answer the description mentioned. Potatoes from such hills are more certain to breed true to type.

Select potatoes weighing from five to eight ounces.

Use for seed no potatoes grown in fields showing a considerable amount of wilt or rosette.

Avoid potatoes showing brown ring discolorations at the stem end.

Save for planting no potatoes which are bruised, cracked, or decaying, or which show discolorations at stem end.

Store carefully in moderately warm, dry, and well-ventilated place.

Treat with corrosive sublimate four ounces to thirty gallons of water—for an hour and a half before planting.

Color is the greatest need of the apple grower. In order to get this, you must prune so as to let the sun, which gives color, into all parts of the tree. The later cultivation is kept up the less color you will have.

One of the best ways to control insects on strawberries is by rotation of crops and clean cultivation.

DAIRYING.

THE UDDER OF THE DAIRY COW

As a rule not enough attention is given to the care of the udder of the dairy cow. We all know that when anything happens to this delicate organ the chances are the the usefulness of the cow is practically at an end. And we do not like to own a cow with one quarter of her bag gone or otherwise out of commission. But we do not think enough about it beforehand to take proper precautions to avoid the loss.

One way the cow may get hurt in the udder is by having another cow step on the part which may happen to lie on the stable floor as the cow is resting. I have known this to happen a good many times, and it is a serious matter. How can it be avoided? The best way I know of is to give every cow a roomy stall, which seems to me to be the ideal way of stabling cows, or by placing a good partition between every two cows, so that adjoining animals may not tread on each other.

Another way the udder may be injured is by having it struck by some man who has the care or the milking of the creature. To have the udder hit by the fist of a cross or angry man, especially when it is filled with milk, is a dangerous thing; and still, even we ourselves do not watch the movements of the hands we employ closely enough to know what this is done, or we are so indifferent about it that in case we do realize what has been done we do not do anything about it. The fact is, no man who wilfully strikes the udder of a cow, or throws a stone at her that hits her there, ever should be permitted to deal with cows. In our day and generation it is too costly an operation to get a good dairy cow up through to service without having her ruined in any such way.

Again, the cow may suffer from udder trouble through incomplete milking. One of the worst cases of this I ever saw was where an old farmer, by reason of stiffened hands, was not able to strip his cows perfectly dry. A little milk would be left in the udder every time. This progressed until one of the cows came very near losing one quarter of her bag. It was almost as hard as a rock and very little milk came from it. I took the cow for a couple of months myself, and by careful handling, drawing every drop each time and working at the hardened udder faithfully, I was able to bring the quarter back to very nearly a normal condition. She gave quite as much milk out of that quarter when I left her as she did from any part of the udder. It shows that care is almost indispensable.

When anything happens to the udder of a cow the best thing I know of is to wash the part with cool or hot water. Some would put a little corn meal in the water, but it is a question if there is any virtue in this. The rubbing is what helps most. By being very persistent and working and kneading the udder every little while, the swelling may, in many instances, be taken out and the usefulness of the udder restored.

Sometimes in the spring of the year, before a cow begins to give milk, the udder will get quite hot and swollen. There used to be a theory that no milk should be taken before the cow dropped her calf. For my part, I believe it better to milk the cow a few times rather than to run the risk of some serious inflammation of the udder. The washing in water and careful manipulation is very helpful in this, as in the case of definite injury.

E. L. VINCENT.

INTELLIGENT SELECTION OF COWS

Not only interest but real value at taches to the question of carefully noting the individual performance of each cow in the herd. It is only after keeping a complete record that one finds such a strange contrast as this: of two five-year-old cows in one herd, both fresh the same day, both dried off the same week, one gave 5,454 pounds of milk and 213 pounds of fat; the other gave only 3,570 pounds of milk and 153 pounds of fat. Most probably the owner would not have taken on a bet at the beginning of the season that the one cow could bring in over twenty-two dollars more than the other, but she did.

In another section, of two cows the same age, one gave 8.430 pounds of milk and 362 pounds of fat; but the other gave only 1,690 pounds of milk and 67 pounds of fat. Is there a difference of eighty-eight dollars in the earning power of any two cows in your herd?

Building up a profitable dairy herd includes the selection of good individual cows. The rational method is to weigh the milk and test samples regularly for fat. Write to the Dairy Division, Ottawa, for information on cow testing, so that your selection may be intelligent, so that your profits may be larger.

RECORD COWS CONTINUE TO PRODUCE

Is the usefulness of a dairy cow ended when the big milk production records for which we strive in these days have been made? The American Guernsey cattle club has studied the history of 63 Guernsey cows that have completed records of more than 700 pounds fat, and have fou d little to substantiate this idea where rational feeding is done.

Of the 63 cows whose history was traced, three have four official records and one has produced 10 registered calves, of which four have been born since making the last record. One of the others lived to be 10 years old and produced six registered calves, and another died from blood poisoning at nine years old.

There were 10 cows with three records each, eight of which produced progeny after their last record, and one of which produced four calves after completing a record of 83 pounds fat. There are 28 cows that have made two records. Of 17 remaining, 11 have produced calves since making their record, or are safe in calf. Of the 63 there were 22 that have only one offi- producedall ry2 cmfwypshrdlucmfw cial record. Of these all but three have produced calves or are safe in calf since completing their test.

indicates that germs are to be found in the udder most of the time. Under ordinary circumstances these bacteria do little harm, but occasionally a harmful one gets in and sets up severe inflammation. This is especially likely to be the case at about the time of freshening, or during the time the cow is drying up. At both periods there is an accumulation of milk that is not drawn out regularly and consequently it forms a good medium in which bacteria can live. When there is much accumulation of milk, milking should be done in order to get out these foreign organisms before they become harmful. While it is not necessary at the time of drying up to encourage milk production by milking dry, yet it is much better to milk out a small quantity so as to get all the organisms out of the sinus, than it is to allow it to accumulate for several days. —I. E. Newsom, Colorado Agricultural College, Fort Collins, Colo.

REASON FOR SLIMY MILK

A reader complains of a cow whose milk gets slimy as it grows sour. The ration of four pounds wheat bran, five pounds middling, and one pound cottonseed meal to only one pound corn meal is pretty strong in protein. Cut down a little on middlings and add a little more corn meal.

There is nothing in the feeding, however, that would account for the fact that the milk gets slimy. This often is due to a bacterial infection that may come from the cow and may be due to the surroundings under which the milk is kept. So long as it is sweet and rich while fresh it doubtless is a wholesome food.

Try using extra care in scalding and sunning all milk utensils and, if possible, keep the milk in a different place. If the trouble is with the cow it doubtless will disappear when next she is fresh.

PLANNING FOR CALF CROP

The best season of the year to have cows freshen depends upon the purpose for which the milk is to be used. If you are supplying milk to a cheese factory, it is best to have the cows freshen in spring. If the whole milk is to be sold in the market, have the cows freshen at different periods so as to keep production constant to meet the demands of your customers. While this can be regulated to some extent, it cannot always be entirely controlled.

If the principal object is to produce the greatest quantity of milk of best quality, and with most profit, the cows should be bred so as to drop their calves in the fall. Fall calves are more easily reared and make better cows than those born in spring or summer.

Right Kind of Shelter and Feed

The cow or heifer freshening in fall needs healthful and nutritious feed. At this time we stable them, give them good care and good feed, and of course, get good results. With the right kind of shelter and feed they may be expected to keep up the milk flow all winter. Then when grass comes in the spring they will respond with increased milk production.

Midsummer days are good resting periods. With short pasture and flies to contend with, the milk flow is usually light anyway at this time. By having the calves come in early fall we secure the largest amount and the best quality of milk at a time when prices are best, while the least amount and poorest quality comes when prices are low.—W. H. Parrish, Coshocton Co., O.

FEED DRY COWS

The time to do the best work with the dairy cow is when she approaches her freshening period. Then you can best take advantage of her maternal instincts. She should have six to eight weeks' rest previous to calving. The most profit I ever make from grain fed to cows is when they are dry. In giving this ration, keep three purposes in mind: First, feed to rest the digestive organs, for she has doubtlessly been overworked the past ten months. Hence give soft, laxative, succulent feeds. Second, feed to store up fat and body energy. Third, provide carbonaceous feeds, as well as protein, for the welfare of the cow herself and the calf. Within two or three days of calving change to a soft mash feed. This is the time I aim to teach them the joy of bran mashes. Good mashes can be made of bran, ground oats, and oil meal in equal parts.

After calving, start the cow on five or six pounds grain. If she is poor in flesh, feed mostly protein. Then skip one day and increase the ration by one-half pound. It is important to remember a cow will make as great a response on one-half to one pound increase in grain as on three or four pounds or more. Work along on this basis until you get the cow to the climax of her production within thirty or forty days. If you have not reached that point at the end of this time, you may as well give up until the next freshening period. When the climax is reached, it is simply a case of varying feed and watching the cow and scales to keep up the production. Whatever changes are made, make them gradually.

There is much misunderstanding about a balanced ration. Many people write asking to balance a ration for their dairy herd. Such a thing is impossible. The only man who can balance one is the man who feeds each cow. A balanced ration for the same

(Concluded on page 544)

Seeing the Difference
between the
DE LAVAL
and other
Cream Separators

THE difference between a modern De Laval and any other cream separator is apparent at first sight. And if you will take five minutes to compare the separating bowl construction, the size, material and finish of the working parts, particularly those subject to wear, the manner of oiling, and everything which enters into the design and construction of a separator as a simple durable machine, you will still further *see the difference.*

Then if you go a step farther and turn the cranks of the two machines side by side for fifteen minutes, running milk or water through the bowl, you will see still more difference.

And if you will run the two machines side by side in practical use, as any De Laval agent will be glad to have you do, the De Laval one day and the other machine the next, for a couple of weeks, you will see still greater difference in the work of the two machines.

Every De Laval agent considers it a privilege to show the difference between the De Laval and other separators and to afford every prospective buyer the opportunity to try out and prove the difference to his own satisfaction, if on first examination he feels the slightest doubt about it. If you don't know the nearest De Laval agent write to the nearest office as below.

WEANING THE PIGS

"Weaning" means to accustom gradually to the deprivation of something hitherto enjoyed. To many pig keepers it appears to mean letting the young pigs have their fill of mother's milk today and none at all tomorrow, when they must put up with quite a different kind of food. It is no wonder that in such cases weaning time is a time of illness—"fits," or convulsions, and indigestion—and death in the sty. When the time comes for weaning, it should not be done quickly, an abrupt change is a great shock to the pig's digestion, and besides it sometimes causes the sow great suffering. Begin by shutting up the sow in the day, and allow the youngsters free range; at night allow them to sleep together. After a few days they may be turned together only every other night In the meantime the sow is fed, for the most part, on dry food, or something that will not cause a full flow of milk, while the pigs are fed all the slop they will eat. In this way the pigs are weaned, scarcely knowing when it is done. There is no check whatever in their growth; while the sow, being fed on maize or some stimulating food, is ready to be bred again in a few days. That stage in a pig's growth that requires the most skill is from the time the dam is bred to the time the pig is weaned. If well handled up to the weaning time the pig will stand some neglect and careless treatment without seriously impairing growth, but there must be but little, if any, foolishness before this time if the best results are to be obtained. The aim is to feed the young and growing pig a kind of food that will promote the growth of muscle and bone. As it approaches maturity, or the time when it is to be marketed or slaughtered, the proportion of maize, that great fat-former, may be gradually increased. During the suckling period feed the pigs largely through the sow, and see to it that the sow is not a bag of bones at weaning time. After weaning, feed the pigs for growth, but gradually increase the fat-forming foods as the pig approaches maturity. Push from the start, and never allow a pig to stop growing.

DEHORNING THE CALF

The best plan of dehorning cattle is to dehorn the calf. Most breeds of cattle grow horns, and most cattle owners prefer to have the cattle hornless; consequently to have the cattle that you want it may demand an operation in order to get them to suit your fancy. The dehorning of a grown animal is often a pretty difficult job; it is always an unpleasant operation for both animal and owner. The sore head and the treatment of the head to protect it from the annoyance by flies, unless operated on in cold weather, is a part of the disagreeable feature of dehorning of grown cattle.

All this unpleasant treatment may be avoided by the use of caustic potash on the new-born calf. The time to use the calf dehorner is while the calf is yet a few days to two weeks old. The embryo horn can be killed at an older age, but the easiest age is from four days to ten days old and before the horn button has become attached to the skull. It will be observed that there is on the calf of all horned breeds of cattle a little horn germ that is loose in the skin where the horn develops. This little embryo horn resembles a button to the touch of the finger in its early stage, and can be moved with the skin by a pressure of the finger.

The treatment recommended is caustic potash or "stick potash." This can be had at any drug store at very small cost, and one stick if taken care of will dehorn a dozen calves. Rub the potash on the horn button, first removing the hair for a space as large as a half dollar; apply it carefully by rubbing directly on the button. The potash should be moistened slightly and rubbed over the skin covering the horn button, until the skin shows distinctly the effects of the caustic. One application should kill the horn germ. It is necessary to wrap the stick of potash with something to protect the operator's fingers. There is some danger of putting on too much and causing the oozing of water to trickle down over the face of the calf, with a chance of its getting into the eyes. This only occurs where too much is used. Better give two treatments ten days apart in case it is necessary than to overdo it by causing too much of this discharge.

NOT ENOUGH SHEEP ON GLOBE TO FILL DEMAND FOR WOOL

That no department of agricultural industry offered the opportunities that were to be found today in sheep breeding was the opinion given in an address at the Ottawa Winter Fair recently by Lieutenant-Colonel Robert McEwen, of Byron, Ont. Colonel McEwen spoke of lambs being now up to $11.75 a hundred, and the average profit per ewe, in meat alone, being about $15 net, this indicating the money to be made in the business.

Meat, however, was not the only product of the sheep, for wool that a very short time ago was worth only 10 cents a pound, unwashed, was now selling at 35 cents. The demand for wool for army purposes was heavy and the life of this wool was exceedingly short, for much of it had to be purified by fire after being in the trenches a short time. The embargo placed on wool by New Zealand would also help the wool market, he said.

Colonel McEwen commented on the beneficial results following the distribution, by the government, of sires and ewes a few years ago. In Manitoba, where, on account of the war and need for economy, the authorities did not purchase the ewes to distribute, they were already sorry for heir unwise economy.

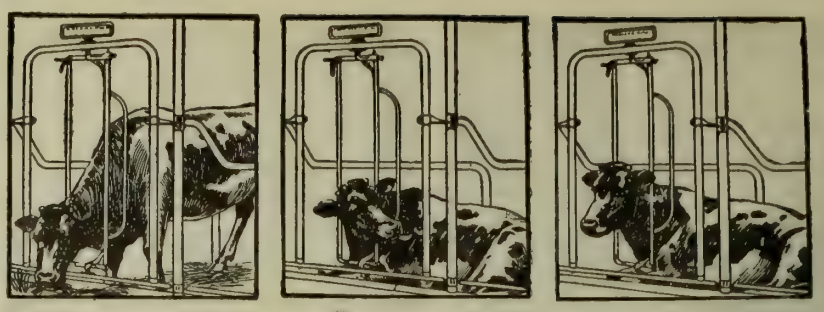
Speaking of the supplies of sheep in this country, Colonel McEwen said that in Montreal in one week recently 5,000 lambs had been sold to the United States, which was rather remarkable. In Australasia the great drought had reduced the supply of mutton seriously.

"In addition to all trade requirements," said Colonel McEwen, "the supply of wool for the Empire's forces is so great that there is not on the globe today, not in existence, enough sheep to maintain it. This should convince any one of the opportunities. I believe this opportunity facing the sheep industry is not equalled in any other line of agriculture."

CARE OF SOW AT FARROWING TIME

Farrowing time is one of the most important times of the year for the breeder of swine. Often a man destroys his chances of success by neglect at this time. While the number of pigs a sow farrows is important, the number she raises determines whether she is being kept at a profit or loss. A sow that farrows five pigs and raises all of them is more profitable than one which farrows fifteen and raises only two or three. The disposition of the sow has much to do with the number of pigs she will raise, but proper care at farrowing time is also an important factor.

A week or so before she is due to farrow, the sow should be removed from the other sows and placed in the quarters where she is to farrow. It is best to feed her a ration high in protein and rather laxative in its nature, similar to the feed she is to receive while suckling her pigs. tAt the Mis-



More Beef More Milk More Butter More Money

There are certain essentials in the care of stock that the up-to-date dairyman will not overlook. Stock must be comfortable, contented, and kept in sanitary surroundings to have them do their best. Positive increases in production are invariably noted where plenty of water, sanitary stable fittings, silage, ground grain feed, etc., are supplied.

Windmills. You cannot keep cattle plentifully watered by the old hand pump process, and if you try, you are sure to tire out before they have enough. WINDMILLS furnish the cheapest POWER and, with a wood or steel tank as a reservoir, will keep your cattle abundantly supplied in all weathers and enable you to care for a larger number. The TORONTO Windmills run easily in light airs, and are regulated for high winds. Quality of material and exclusive principles of construction make TORONTO Windmills decidedly superior. Prices on application.

Stable Fittings. We have one fixed idea in our TORONTO Stable Equipment, i.e., to make it GOOD without making it COSTLY. We can compete with any in price, but we do not resort to certain "make-believe" methods in finishing which reduce the cost and reduce the real value. We charge low prices for high quality. Simplicity is one advantage, strength and endurance are others, found in our line. Sold in genuine Galvanized (not merely aluminum slushed) or in black paint finish. Get our prices and specifications.

Litter Carriers. A good litter carrier, like the "TORONTO," with its easy hoist, smooth running track and trouble-free switches, is not only a manure saver, but a work saver and a money maker. Made of steel and galvanized iron, substantial and durable. Tested by time and proved "just right." Ask for catalogue and prices.

Silos. Wood is the best material. We make ours out of selected 2-inch spruce, creosoted to preserve from decay. Staves double-tongued and grooved, with steel splines at ends, hoops of steel beat to fit; frost-proof malleable lugs; panamoid roof. The Toronto Economy Silo is air-tight. Shipped ready to put up. Our price will interest you; write us.

Water Systems. To properly water cattle on a stock or dairy farm, there should be a well-piped system leading from tank in barn loft or attic, with water basin in every stall. The acknowledged BEST in Water Basins is the TORONTO Water Basin; always full, but never overflows, cannot clog with chaff or dirt. We will gladly suggest plans and prices for installing complete water system for house and barn, with gravity or air pressure tanks and windmill or gasoline engine power. Write us about it.

Pumps. We make every variety of pump for domestic, outdoor and indoor use. For Water Systems, we recommend our popular Fig. 19, or our No. 648 Pump, a combination hand and power pump, with air chamber for ramming water to elevated tank or for hose pressure. This pump will also work by electric motor, with TORONTO Jr., 1¼ h.p. Gasoline Engine, or with 2 h.p. Chapman Engine. Write for our Folder on Water Service, and state whether you wish to use Windmill, Gasoline Engine or Electric Power.

Write for Booklet on Water Systems

Engines. Chapman Engines are extra strong and heavily constructed. They generate great power on light fuel consumption. The Chapman is the highest type engine of its kind on the market. Our TORONTO Engine, slightly lighter in build, is a very capable and economical engine at a lower price. Get full particulars.

THE "OCEAN LIMITED"

Canadian Government Railways' Popular Train, Halifax and Montreal, May 15th

From its initial run, the "Ocean" won popular favor, has retained its friends, and is always making more. It will be welcome news to thousands of travellers that the "Ocean" is to be restored to its regular run on its regular schedule May 14th, from Montreal at 7.25 P.M. and daily except Saturday thereafter, arriving at Halifax 10.45 P.M. the following day; May 15th, from Halifax at 8.00 A.M., and daily except Sunday thereafter, arriving Montreal 8.05 A.M. the following day.

The timetable is so arranged as to permit daylight views or some of the most picturesque parts of Caanad—the Wentworth Valley, La Baie de Chaleur, the Matapedia Valley. And when you travel on the Ocean you travel on one of the best trains in America.

Advertise in The Maritime Farmer and get Results.

souri Agricultural Experimental Station good results have followed the use of a ration of corn, 50 per cent; shorts, 25 per cent; bran, 15 per cent; and linseed oil meal, 10 per cent—all by weight. As the farrowing date comes closer, the ration should be reduced somewhat. This will bring the sow up to farrowing time in good condition. She will not be so feverish and restless, so there will be less danger of her mashing her pigs when she farrows.

An important precaution to be obsevred in caring for the farrowing sow is not to supply her with too much bedding; a bushel of wheat chaff or cut straw is good. If the place where the sow is to farrow is warm, it will not be needed for warmth. The danger of supplying too much bedding is that the pigs will be covered by it and be smothered or crushed.

The less a sow is disturbed at farrowing time the better, and for that reason she should be kept separate from the other hogs. While some one should be on hand, unless she needs assistance it is best to keep away from her. If necessary to help her, do it as quietly as possible.

The pigs should not be chilled before they have dried off and suckled, so if the weather is cold a lantern hung in the top of the cot will be of service. If the sow is gentle, it is well to take each pig away from her as soon as it is farrowed, and place it in a box or barrel containing some hot bricks covered with old sacks. After the pigs have dried off and are lively enough, they may be put with the sow. In case the pigs do become chilled, the best way to revive them is to dip them in hot water.

As the pigs are not able to take much milk, the flow should not be stimulated for a few days. Give the sow plenty of water, as she is in a feverish condition, but take the chill off of it if the day is cold. It is not necessary to feed the sow for a day or two, and the first feed given should consist of a small amount of thin slop, which should be gradually increased as the pigs become able to take more milk. In two weeks' time she should be on full feed, which should consist of a good laxative, milk-producing feed. There is no better way of feeding the pigs than through the mother, so feed the sow for the greatest amount of milk.

HOGS GOT PARALYSIS? FEED BONE-BUILDING FOOD

"Paralysis of the posterior part of the body appears to be a rather common condition in growing hogs, and sometimes even in mature animals," declares I. E. Newsom, of the Colorado Agricultural College, at Fort Collins. "While in some instances it may be due to mechanical causes, such as injury to the back, yet these cannot explain the greater number of cases. Some have suggested that intestinal parasites bear a causal relation, but this is open to considerable question as it is difficult to see just how worms in the intestine could produce paralysis.

"The theory that seems most plausible is that the bones, particularly of the spinal column, become softened, thus producing pressure on the spinal cord. The softening of the bones is probably due in many instances to lack of lime salts in the food, and is not infrequently noted when the victims have been heavily fed on corn. Consequently a rational treatment consists in the addition of lime water to the feed and an entire change of diet, especially with a view to building better bone. That this treatment will have any beneficial effect on the affected animals is open to question, but such measures when instituted should prevent other animals coming down with the disease."

THREE VITAL QUESTIONS

Are you full of energy, vital force, and general good health? The LAWRENCE-WILLIAMS COMPANY, Toronto, Can.

THE HORSE

STARTING THE STALLION ON HIS SEASON

A correspondent invites us to offer a few hints as to the most profitable methods to be employed in getting a stallion started on his season, the information being vouchsafed that the intention is to travel the horse four days a week, keep him in town Friday and Saturday, home on Sunday, and then hit the gravel again Monday morning bright and early.

On this basis, the two first things to be done are to get the horse himself into as nearly proper trim as possible and then advertise the route he is to take—this route having apparently been settled during the winter as per agreement between the owner and sundry prospective customers. Let us suppose that the season is to open May 1, which is a Saturday, that day would find the stallion at the appointed stable in town. He would then be taken home that night and be ready for a proper start on the pike Monday morning.

As to the present care of the stallion, that will depend on the manner in which he has been kept during the winter, and of this we are not informed. It is presumable, however, that the horse has not been worked and is at present being fed an unwonted amount of grain in order to build him up in condition before the opening of the season. That, of course, is necessary, but at the same time he should have plenty of exercise. The run of a paddock or yard will not do. Though a horse raging around a small yard may seem to take a lot of exercise, he really does not. He should be hitched up and driven daily, the distance being increased until he is getting from eight to ten or twelve miles a day. A better way is to put him right into the team harness and make him do a share of the lighter farm work, according to his capacity to begin with, for then he can be made useful and the time of a man is not taken up half a day to give him his work. If put to harrowing now a stallion can be driven half a day in a team, which can be gradually increased until at the end of a week he is working eight or ten hours, the man driving him being the only one competent to judge of the amount of labor that should be demanded of him.

Anyway, it is no bad thing to work the horse until he is a bit weary, of course, well within his capacity. The functions of his body will then soon get into smooth working order and the processes of elimination and repair up to concert pitch. Anyway, however he gets it, the horse must have abundant exercise and rations to correspond. And it must be real exercise. Walking a horse in hand is the most tiresome chore imaginable, and few grooms there are conscientious enough to trudge eight or ten miles along the highway for the sake of doing their duty by the horse. So why waste the time of a man, when wages are so high? Why not make the horse's labor count in the work of the farm instead of putting in that same amount of time gadding along the road?

Oats is the best feed for the stallion during his season, but if he has been getting corn or some other food, never attempt to change it suddenly. Better keep on feeding corn than change suddenly to oats. Begin by substituting a small portion of oats for some of the corn and so gradually effect the change. This presupposing that the horse is healthy and is receiving proper grooming. If he is not healthy, call a veterinarian and let him take the case in charge. At all costs prevent the horse abusing himself. Pay particular attention to this feature. Thorough grooming is almost as essential as work and good food. By the combination of careful attention, a judicious amount of work, and plenty of sound, clean food, with not more hay than one pound per day for each hundredweight the horse weighs, he should get into decent shape in two or three weeks, and if vigilance be not relaxed should stay that way indefinitely.

Next, having arranged the route, and of course having complied with the law in the matter of obtaining a license and posting the required notices, proceed to advertise the horse's season. Interview the editors of the weekly papers circulating most extensively in the region in which the horse will stand. Contract for a reasonable amount of advertising space, and therein announce his services for the season, giving the horse's breeding and such other particulars as will likely attract the attention of mare woners. Publish in this advertisement the route the horse will follow, and then make the groom keep to his schedule religiously, so that those who wish to breed mares may never be disappointed. There is little more exasperating than to drive a mare several miles to meet a stallion and then discover that he is not there and won't be perhaps that day. By having the horse always on hand as advertised the owner will make friends and increase receipts.

If the stallion has any record as a prize winner, or if he has sired any such winners, get the editor to make some news mention of the facts. The more publicity that can be had through the local weekly papers the better will be the results. The writer speaks from personal experience in this regard. Then to fill the bill for those who do not read the papers, have some attractive posters struck off and post them up, always complying with the law in such cases made and provided, in such places where men do congregate, at cross roads, and other advantageous locations. Better have these posters printed on cloth-backed cardboard, so that when tacked in place they will not be whisked off by the first passing breeze. Likewise, have a few cards printed, giving the name of the horse, his pedigree in brief, terms, and the route to be followed. A supply of these should always be carried by the

Just Suits My Needs Building Up the System

This is the Way Thousands of Women are Speaking of Dr. Chase's Nerve Food

"I want to state that I have never taken anything to do me so much good as Dr. Chase's Nerve Food," writes Mrs. Edson Brock, Trenholmville, Que., and I am never without it in the house. I was so nervous I could not sleep, but now I sleep soundly at nights and wake up feeling refreshed and ready for the day's work. I used the Nerve Food for months and found that it just suits my needs and has built up the system wonderfully. I know it is Dr. Chase's Nerve Food that has brought about the great change in my condition and am thankful for it.

"My husband was a great sufferer from itching piles and has been entirely cured by Dr. Chase's Ointment."

We are constantly receiving letters like this in regard to Dr. Chase's Nerve Food. Everywhere it is being used because of its great restorative and reconstructive influence on the nervous system. Men and women who are run down in health, tired, nervous and discouraged, find in this great Food Cure the means of nourishing the exhausted system back to health and vigor.

Headaches, indigestion, sleeplessness, nervous irritability, lack of energy and vigor—all tell of nervous exhaustion, and indicate the need of such treatment as Dr. Chase's Nerve Food.

Instead of affording mere temporary relief by stimulating the nerves, Dr. Chase's Nerve Food builds up the system by supplying the ingredients from which Nature forms new rich blood and revitalizes the wasted nervous system. Put Dr. Chase's Nerve Food to the test when you are feeling tired out and discouraged, fill the body with new rich blood and new nerve force and you will realize again the joy of good health. 50 cents a box, 6 for $2.50, all dealers, or Edmanson, Bates & Co., Limited, Toronto.

Was All Choked Up

Could Hardly Breathe.

BRONCHITIS

Was The Cause; The Cure Was

DR. WOOD'S Norway Pine Syrup.

Mrs. Garnet Burns, North Augusta, Ont., writes: "I caught a dreadful cold, going to town, and about a week after I became all choked up, and could hardly breathe, and could scarcely sleep at night for coughing. I went to the doctor, and he told me that I was getting bronchitis. My husband went to the druggists, and asked them if they had a cough medicine of any kind that they could recommend. The druggist brought out a bottle of Dr. Wood's Norway Pine Syrup. I started using it, and it completely cured me of my cold. I cannot tell you how thankful I was to get rid of that awful nasty cold. I shall always keep a bottle of Dr. Wood's Norway Pine Syrup on hand, and I shall only be too glad to recommend it to all others."

Dr. Wood's Norway Pine Syrup is a remedy that has been on the market for the past twenty-five years, and we can recommend it, without a doubt, as being the best cure for coughs and colds that you can possibly procure.

There are a lot of imitations on the market, so when you go to your druggist or dealer see that you get "Dr. Wood's;" put up in a yellow wrapper; three pine trees the trade mark; the price, 25c and 50c.

The genuine is manufactured by The T. Milburn Co., Limited, Toronto, Ont.

JOHN PALMER COMPANY, LIMITED
Fredericton, N. B. - - Canada

groom in charge, likewise by the owner, to be handed out whenever favoring opportunity presents itself.

With preparations thus made—that is, with the horse in decent physical shape and his services properly advertised as suggested or in any other feasible manner present him for public inspection in the town where he is to stand, and keep him there two or three days before the opening of the season. Though a great many people may not gather in town on Thursday or Friday, the townspeople interested will be glad of the chance to have something fresh to talk about; arrangements for advantageous boosting later may then be made, while trade may be drummed among such visitors as come in for supplies, repairs to machinery, mail, or the like. A few days immediately before the advertised opening of the season may thus be profitably spent.

From the start, be definite as to the terms on which mares are to be bred, and so facilitate collections later on. The stallion business is too often conducted on a slipshod basis, entailing a most unnecessary percentage of bad or at least doubtful debts, but on this matter of stallion fees and their collection more will be said next week. And just by way of a hint, if any of the physicians or veterinarians in the town owns a microscope of the necessary power, have an examination made of the spermatic fluid of the horse, as much for your own information and satisfaction as anything else. It will be pleasing to know that the spermatozoa are lively and in sufficient volume, and at least protective if they are not.—J. H. S. Johnstone, in Live Stock World.

BROOD MARES MAY BE WORKED

Pregnant mares can be worked advantageously right up to foaling time. Work should not be too heavy, but ordinary farm work will not hurt them. Successful colt raisers nearly always work their mares, and seldom have trouble with either mare or colt.

If you have no work, turn them out in a field every nice day. Always be very quiet and gentle with a mare in foal. In bad weather she is better off in the stable.

Fancy feeding is not necessary. Feeding and watering should be quite regular. A horse fed regularly and fully will seldom eat too much. The best hay for brood mares is mixed clover and timothy. Avoid all damaged feed. Some wheat bran and oats may be fed, even though the cost is high. Cut down on corn as foaling time approaches.

After the colt is foaled the mare should not be worked for about ten days, and then lightly for a couple of weeks. Care should be taken not to overwork or overheat her, as this will cause the milk to be bad and may cause colic or indigestion in the colt. It is best to leave the colt in the barn while its mother is at work.—William F. Purdue, Madison Co., N. Y.

THE USE OF SWEAT PADS

Replying to questions with respect to the use of sweat pads, I may say that it is necessary to view them from several different angles. There is no gainsaying the fact that the horse which is kept at work regularly, and remains in about the same flesh, works best and looks best in a properly fitted, well-made leather collar. On the other hand, when horses vary considerably in condition during different seasons of the year it is necessary either to carry a larger stock of collars than most of us care for or to use sweat pads. Furthermore, by cutting them up and using them in different thicknesses pads may be used to protect galled parts. For this last purpose a strong breast collar or humane collar is frequently satisfactory. "Sweats," even though they are hard to keep clean, are quite necessary at times. It is well to buy a good quality of pad.

WITH LOUDEN EQUIPMENT IT IS EASY

Your time during haying and harvest is most valuable. Save one-third of it by using Louden Hay Tools. They enable you to move larger loads easier and faster than in any other way. There are no delays at the barn for the user of Louden equipment. Louden Carriers with forks or slings will handle the loads safely and surely, and just as fast as they can be drawn from the fields.

THE LOUDEN JUNIOR CARRIER

Is at all times safe and dependable, because of its simplicity and its strength. For twenty years it has been standard, and on thousands of farms it is to-day giving excellent service.

THE LOUDEN BALANCE GRAPPLE FORK

Set the tines of the fork deep into the load. It will lift an immense bundle and deliver it in the mow in even flakes, not tangled up as is the case when other forks are used. Handles clover, alfalfa, loose grain or straw, as clean as timothy.

Our catalogues will tell you all about the big Louden line. Write for them to-day. They are free.

POULTRY

LESSENING DEATHS AMONG THE YOUNG CHICKS

Every chick that dies increases the cost of raising the flock. If the little fellows are purchased as 'day olds," this is more particularly true than when the hatching is done at home; yet in any case the mortality is costly. The critical period stretches over the first two or three weeks of the chick's life. After that some may die or occasionally an epidemic will break out in the flock and take off a considerable number. The danger is much less, however, after the first three weeks are passed safely.

Overfeeding and feeding when too young are the causes of many deaths, also improper foods often prove fatal. Young chicks should have no food for 36 or even 48 hours after hatching. Corn bread, rolled oats, and hard-boiled eggs are good feeds for the first few days. Cracked wheat and fine cracked corn may be fed when the chicks are a week old. Amoid moist mashes. These cause all sorts of digestive troubles. Feed sparingly at first. Do not throw down a lot of food to become foul and unfit for use.

Cleanliness is essential in raising chickens. See that all the houses and coops are thoroughly disinfected before the chicks are placed in them. Keep the brooders clean. Spray or wash them with a coal tar preparation. This is the most effective way of destroying germs and vermin. White diarrhea, the deadliest enemy of young chicks, is spread by foul quarters, and unclean drinking fountains and feeding troughs. Pure water is very ecessary.

Vigorous breeding stock is the first essential for healthy chicks, but sometimes when a good start is made neglect and improper care work havoc. In large flocks, one or two having the white diarrhea may cause a considerable percentage of mortality. This disease is often spread a good deal during the first day or two of the life of the young chicks. In incubators where the chicks drop down into the light as soon as hatched they pick up droppings, and one with the disease may contaminate a large part of the flock. Chicks hatched with hens are freer from the disease because the little birds remain under the mother hen until they are fed, and hence do not have a chance to pick up neglected droppings. For this reason it is well to keep the incubator dark until the birds are removed to the brooders.

Warm, dry quarters are necessary at first. Sunlight is also a great help in building up the strength of the little fellows. Give only a limited range at first, and especially if hen mothers are allowed with the chicks. Free range is never advisable for chicks until they are at least a month or six weeks old.

If chicks are kept in clean quarters there should be little danger of lice. Look over the little fellows, however, and put a bit of lard on the head and under each wing of the whole bunch. This will effectively deal with the body lice, if the old hen is also treated. Should red mites appear in the coops, nothing but a thorough cleansing and spraying will deal with them.—C. H. Chesley.

WEIGHT VS. COUNT METHOD

The theory that eggs should sell by weight rather than by count does not appear to be gaining ground. Apparently the theory is not being pressed very hard. It istrue the thrifty housewife in the city often complains she must pay the same for small eggs as for large eggs, which by itself is a very proper criitcism. Poultrymen who raise the breeds which produce large and heavy eggs sometimes object to the present method of selling, believing they do not get the full value for their larger and heavier product. On the other hand, the poultry trade folks see no reason for a change to weight system of buying and selling. Some poultry authorities confess ignorance as to what should or should not be done.

The housewife's point seems well taken, and there is little objection to the large poultryman's point of view. No one will gainsay that if a poultryman produces a better product he should receive a better price. If the weight is chosen as a selling basis, there must be a "standard" egg. Standards have been arbitrarily set regarding quality of the eggs, and a fresh egg on the market must meet the standard of the market where it is sold. Here's where the trade folks come in. Weight cannot be used as a basis without just as strict a line in regard to quality as at present. But the trade folks who have expressed themselves to a representative believe weight is now considered and allowance made in the price. It is certain that large eggs of a certain quality do bring, in general, more consideration than small eggs. It is equally true that storage folks will seldom take a 30-dozen case of eggs of storage that does not weigh 56 pounds.

Another little point in this connection has interest: A large rotten egg weighs about the same as a small fresh egg. From all this it would appear that to put the theory in practice, either weight or quality must be used as a basis, modified by the other, if the count remains 12 eggs to the dozen. Approaching from a different angle, a standard might be made whereby 24, 26, or 28 ounces constituted a dozen. The count in this case might be 11, or it might be 13 eggs

Again, according to Prof. C. T. Patterson, of the Missouri Station, there was a difference in weight of eggs laid in the Missouri egg laying contests of from 2.03 ounces to the egg to 2.29 ounces. The hens averaged in weight from 3.12 pounds to 6.36 pounds. The difference in egg weight is approximately 13 per cent. This is a good per cent of difference, but is the actual weight difference enough to be considered large?

In the winter season an egg often costs the city housewife 5 cents, and if it is a little egg weighing 2.03 ounces the egg costs the consumer at the rate of approximately 40 cents a pound. If an egg weighing 2.03 ounces is worth 5 cents, the 2.29 ounce egg at the same rate would be worth 5.1 cents; the difference in egg value per dozen between the two weighs would be 1.2 cents.

The producer sells at a lower price than the consumer buys, and through the months when eggs are plenty at still lower figures. His difference in selling by weight, then, is smaller. If the theory was put into practice who knows but what the present market price would be manipulated as the standard for the heavy eggs, and the light-weight producer lose, rather than the heavyegg producer gain?

THE CARE OF EGGS

The loss of eggs during the early spring and summer months is estimated at from 5 to 25 per cent of the total production. The causes of this enormous waste are briefly two: (1) Persons who have only small flocks do not realize the necessity of gathering the eggs daily and the keeping of the collected eggs in a cool, clean place until marketing; (2) the dealers do not provide proper places in which to keep the eggs from the time they are received until they are sold to the consumer, or packed in cases and shipped to the wholesaler in the city.

The writer is of the opinion that the blame for this loss is not always the farmer's, but a good share rightly belongs to the merchants and dealers who place their eggs in store windows and allow the sun to shine on them until the lot is sold. Incubation will start in an egg at a temperature of 70 degrees, and often the temperature inside a store show window will be very near 100 degrees. Eggs kept in such a window for only a few hours will become unfit for food, and if sold over the counter the customer will complain of the quality, and dissatisfaction will result all round.

The Poultry Department of the Agricultural College is endeavoring to appeal to all dealers this spring to provide proper boxes in a cool, clean place in which to store eggs until they are sold, and use neat printed display cards in the window of the store to attract attention. The exhibiting of eggs in the store windows is both an injury to the trade and a loss to both consumer and dealer. The

BY APPOINTMENT TO H.M. KING GEORGE V

For The Bride

Will you allow the Silversmiths to His Majesty, King George V, to assist you in selecting suitable presents for the June Bride ?

With the Mappin & Webb Catalogue from which to make selections, and the Mappin & Webb standard of quality to commend every piece on which you decide, Gifts for the bride may be chosen with nice discrimination and rare fidelity to service and artistic merit.

very perishable nature of this important food product is a sufficient reason for all persons handling them to use every precaution possible to supply only eggs of fresh quality. Your personal support and co-operation is asked to bring about very much needed improvement in this trade.—J. P. Landry.

THE NEST BOXES

A matter requiring careful attention, but which is frequently overlooked, is the nest boxes. These are best made of bottomless boxes, about fifteen inches square and eighteen inches high, standing upon a shelf a few inches above the ground. Fixed nest boxes should never be employed, as they are so difficult to clean, and if the greatest care is not exercised will harbor vermin and the like. They should be a few inches from the ground, because when on the floor there is a danger of the hens eating or the rats removing the eggs. There should always be a sufficient number, as when too few are supplied the hens lay about the house, and in this way the vice of egg eating is encouraged. The nest boxes should be placed in the darkest part of the house, preferably below the window, as the less the birds are disturbed while laying the better. More than this, if facing the door or the window, it would mean that during hot weather the sun would shine directly on the eggs, possibly starting the germ into activity, at any rate doing the eggs no good. Straw is the best material with which to litter out the nests, and oat straw is better than either wheat or barley, being more pliable. Hay is not so suitable as straw, as it is a retainer of heat, and becomes foul sooner than the latter.

LICE AND MITES

Bulletin No. 86, of the Storrs Agricultural Experiment Station, on the subject "Some Lice and Mites of the Hen," by Lawson and Manter, places emphasis on the following points:

1. That there is much confusion regarding the relative harmful effects of the lice and mites, owing to the fact that the lice are more easily seen, with the result that they are often accused of causing injury actually done by the mites.

2. That the lice can be easily controlled by the use of blue ointment rubbed on the hen.

That carbolenium or one of the coal tar products will kill or repel the mites if applied once a year by the right method to the roosts.

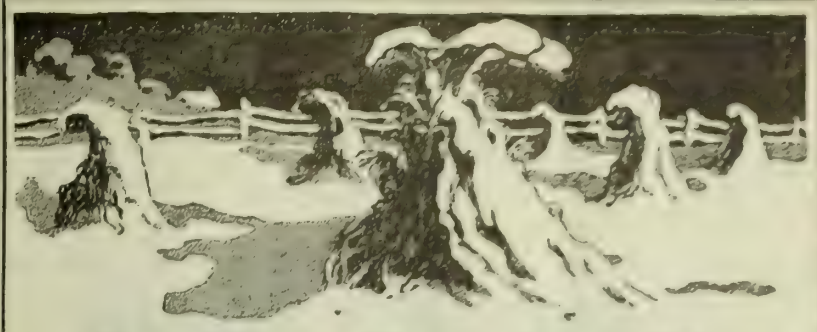
4. That caraway oil proves the best control measure for the scaly leg mite.

This bulletin is the product of much experimental work, covering considerable length of time, with studies of these pests on a large number of hens and chickens, both out of doors and by close observation in the laboratory. Several facts regarding the life histories of these parasites are new to science.

POULTRY HINTS

So many foolish people think that successful poultry raising is just the industry for semi-invalids, but experience teaches us that to be successful it takes plenty of muscle and energy to make it pay.

Cramp is a disease caused by cold and dampness. The toes become curled up and the bird walks on its knuckles or the knee joints. Bathe the feet in hot vinegar and water, and keep the bird warm and dry until it is again able to walk as usual.



Put Your Corn in a Silo and Prevent this Waste

PRACTICALLY one third of the feeding value of your corn crop is lost when you allow the fodder to become dry or to stand exposed to the weather. Besides, it is a great deal of trouble to feed corn stalks, and cattle cannot eat them up clean. Any way you look at it there is a big waste that could be prevented by putting your crop in an

IDEAL GREEN FEED SILO

This silo assures you of well-preserved silage, the only kind that has any value. You cannot expect good silage from a "cheap" make-shift silo. You cannot make or save money by buying such a silo, no matter how low its cost. Low price is not what makes a silo a good investment. It is the quality of the silage you get out of a silo and the number of years that it will last that determine its value.

Every feature of the Ideal is the result of long experience in silo manufacture. Every detail in the selecting of the material, and the manufacture and fitting of the parts is clearly explained and illustrated in our large silo catalogue. There is nothing obscure or indefinite about the superiority of the Ideal.

Ask for a copy of the catalogue and read it. You will see just what kind of material is used; how the staves are milled, splined and made to fit perfectly; how the wood is treated with a preservative that protects it from the moisture and acid in the silage; how the entire silo is put together to withstand for many years the tremendous pressure of the silage.

Get all the facts about this silo clearly in mind. Write today for catalogue.

One of Life's Lessons

By Eben E. Rexford

Martha, at work over the hot stove, on one of the sultriest of summer rays, felt cross and out of sorts with everything and everybody. Baby Dolly was very fretful because of the heat, and kept asking for a drink every time her mother had her hands in some kind of work that made it impossible for her to comply with the petulant request on the instant. Failure to respond promptly to the little one's demands was sure to result in a wail of indignant protest that jarred on the tired woman's nerves until she cringed as if someone had struck her a blow. Her work was continually going wrong. The berries she was "putting up" had been on the verge of scorching several times. One or two jars had burst after she had filled them with fruit, and their contents had run all over the table and made a great puddle of sticky sweetness on the clean floor before she could get control of it, and in the attempt to save a portion of it from becoming a total loss she had burned her hand. And the baby, a little later, had taken advantage of her absence from the kitchen for a moment, to creep into the puddle of berry juice and make a fright of herself by daubing it all over her dress, which had been fresh and clean when put on after dinner.

"Dear me! I feel as if I'd scream at what happens next," thought the nerve tortured woman. "You naughty girl! What possessed you to get into that puddle and make your dress look as if it hadn't seen the washtub for a month? Now I'll have to wash you from head to foot, and put a clean dress on you, and while I'm doing it the berries'll have to wait, and when I get round to them again a good deal of the work'll have to be done over. You deserve a good whipping. I've a good mind to give you one!"

"I wouldn't whip her if I was you, Marthy," said a quavering old voice at the door. "She didn't mean anything wrong. She's too young to sense things. Le' me take her out in the yard where it's cooler, an' mebby I c'n get her to sleep."

"Don't come round here meddling," cried Martha, hotly. "I guess I can get along without your advice. I'll try to, anyway. Dolly deserves a whipping. She's old enough to know what it means, and I might as well begin now as any time."

The Angry Word

"Oh, Marthy, don't strike her!" pleaded the old man in the doorway. "You'll be sorry if you do. You're all out o' patience now. Wait till you kind o' cool down, an' think it over. W'y, Marthy, I'd a good 'eal ruther you struck me! 'Twouldn't hurt me so much as it would to have you poush her—poor little thing!"

"I wish you'd get out of my sight and keep out of it!" cried the angry woman. "Don't you dare to talk to me in that way, Silas Budd! We've humored you and put up with you because you're an old man, and we felt sorry for you, till you act as if you thought you was boss here. I've got sick and tired of it. I won't put up with it any longer."

"I didn't mean to say anything to make you mad, Marthy," said the poor old man, humbly. "On'y it didn't seem jest right for you to punish that poor little creetur when you was so—so put out with things. We do things we don't mean to when our temper's got the upper han's of us, an' we're sorry for it afterwards, but that don't help matters. Come, Dolly, le's you an' Uncle Silas go an' swing in the yard, an' hear the birdies a-singin' in the trees."

"She isn't going one step with you," said Martha, in a tone as hard as flint. "You make me out of all manner of patience with you, Silas Budd. You humor the child so I can't do anything with her. She think she's got to have someone paying attention to her all the time. I've got work to do. I can't waste my time on her. Keep still"—this to the child, who was reaching out her hand to the old man, and trying to wriggle out of her mother's arms. "Keep still, I say, or mamma'll whip you!"

"Oh, do let her come," pleaded the old man. "I'll take care of her so you can go on with your work an' not be bothered the least bit, Marthy. She wants to come. I reckon I c'n get along better with her than you can, Marthy."

His words angered the woman beyond the point of endurance. She was in that highly wrought-up condition that makes a man or woman for the time being an unreasoning creature. Usually she was glad to have the old man take care of the child, for he was always to be trusted, and no mother could be kinder than he was. But now she felt jealous of his influence over her little one.

"Silas Budd," she cried, not stopping to think what she was saying, and not caring, "I wish you'd clear out! Seems to me it would rest me more than anything else I can think of to get rid of the very sight of you. You're always talking about going over to Cousin Oliver's—why don't you go? I wish you would, and that you'd stay there till I asked you to come back. I reckon you'd stay quite a spell before that happened."

"Marthy, do you mean that?" asked the old man.

"If I didn't, I wouldn't have said it," was the harsh reply.

"Well, I'll go, then," said the old man, with more spirit than she gave him credit for. "I won't stay where I ain't wanted. An' I shan't come back till I'm asked to, neither."

"Well, if you don't come back till I ask you to, you'll be a good deal older than you are now," was the cruel response.

"Mayn't I kiss the baby goodby?" the old man asked, with a quaver in his voice. "Don't seem's ef I c'd go 'thout doin' that."

"I've put my foot down on the whole business," said the woman, with a cruel delight in torturing the old man. "I've turned over a new leaf, and it isn't going to be turned back now. I guess you'll manage to live through it if you don't kiss her. Anyway, you'll have to." The truth was, Martha had no idea that he really meant to go away.

"By-by, Dolly," the old man said to the child, who stretched out her little arms to him, and exerted all her strength to break away from her mother's restraining arms, to get to him. "By-by, darlin'," and then tears came and made the poor old man blind to the eager face of the little one, as he turned and went away groping'y, like one walking in darkness.

Presently Martha saw him going down the lane, with a little bundle tied in a handkerchief.

"I declare, he really is going," she thought. "Well, I'm glad of it. I don't care if he stays always. He does vex me so!" She looked out once more, and saw the old man turn into the highway, at the end of the lane, and the thought came to her that she had never seen him stoop so much or walk quite so feebly. It was as if he had grown old all of a sudden. At the end of the lane he turned and looked back to the house. Dolly saw him, and stretched out her arms with a cry that had a call in it. He heard, and waved his hands to the child, and then turned suddenly and walked out of sight, as if he could not trust himself to look that way again.

Martha had reason to think of Uncle Silas more than once that afternoon. The woodbox that he was in the habit of keeping filled was empty, and she had to replenish it at the cost of many extra steps. It seemed as if she had never used half so much water before. When Uncle Silas saw to keeping the pails filled she had not realized how much was necessary to her daily needs. Dolly woke from her afternoon nap, cross and fretful, and she had to spend a good deal of time with her. If Uncle Silas had been there—with the new leaf unturned—he would have relieved her wholly of the little one's care. She was so constantly reminded of Uncle Silas's customary helpfulness by the lack of it this afternoon, that she began to realize how little she had appreciated his services.

When her husband came home at night, he missed the kind and gentle old face at once. Martha told him that Uncle Silas had at last put into execution his often-spoken-of plan of visiting Cousin Oliver's folks. She did not think it advisable to explain how he came to take so sudden a start, for she knew her husband would blame her in the matter. The truth was, she began to blame herself. She was ashamed of having let her temper lead her into saying harsh and unkind things to the old man, for she knew they had been undeserved.

"He'll be back in a day or two," she told herself. "I'm sorry I said what I did to him. It'll be a good lesson to me. I'll try to keep my patience better in future."

But the days went by, and Uncle Silas did not come. John, who missed the old man almost as much as the baby did, kept wondering why he stayed away so long. Little Dolly, every day, and many times a day, kept asking for the friend she loved so well and missed so much. She would creep across the floor to the empty old rocker which had been Uncle Silas's favorite seat, and pull herself up by it, and lay her head down on the cushion and cry, and refuse to be comforted. The sight of the little one's grief smote the mother's heart keenly. More and more she blamed herself. More and more her heart was stirred with pity for the poor old man whom her bitter words had driven away from the only place he could call home.

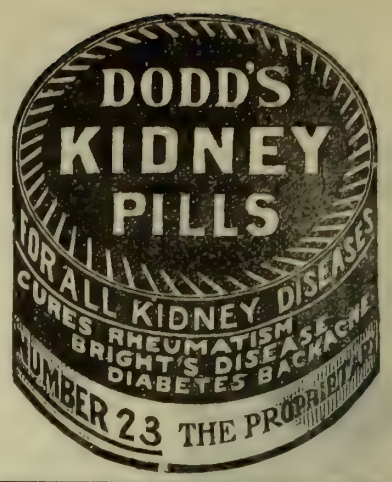
Home Again

"If Uncle Silas doesn't come back by Saturday, or send some word, I'm going over to find out what keeps him," John said one day. "I want to see him so much that I feel as if I were homesick. I didn't know how much I cared for him before. The palce seems as dull without him as spring would be without the blackbirds."

Saturday came, and Uncle Silas had not returned. Sunday afternoon John "hitched up" and drove over to Cousin Oliver's.

"Tell Uncle Silas that Dolly wants him," said Martha, as he drove away. "And tell him that I want him, too. Don't forget to tell him that I said so."

Martha felt quite sure that if she sent that word to the old man he would say nothing about the cause of his going away. It hurt her New England pride—or stubbornness—somewhat to admit, even to herself, that she was sorry for what she had done. But she had, with that pride, the New



YOUNG WOMEN MAY AVOID PAIN

Need Only Trust to Lydia E. Pinkham's Vegetable Compound, says Mrs. Kurtzweg.

Buffalo, N.Y.—"My daughter, whose picture is herewith, was much troubled with pains in her back and sides every month and they would sometimes be so bad that it would seem like acute inflammation of some organ. She read your advertisement in the newspapers and tried Lydia E. Pinkham's Vegetable Compound. She praises it highly as she has been relieved of all these pains by its use. All mothers should know of this remedy, and all young girls who suffer should try it."—Mrs. MATILDA KURTZWEG, 529 High St., Buffalo, N. Y.

Young women who are troubled with painful or irregular periods, backache, headache, dragging-down sensations, fainting spells or indigestion, should take Lydia E. Pinkham's Vegetable Compound. Thousands have been restored to health by this root and herb remedy.

If you know of any young woman who is sick and needs helpful advice, ask her to write to the Lydia E. Pinkham Medicine Co., Lynn, Mass. Only women will receive her letter, and it will be held in strictest confidence.

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write today. Address: Mrs. M. Summers, Box 309, Windsor, Ont.

Heart Would Beat Violently.
Nerves Seemed to Be Out of Order.

The heart always works in sympathy with the nerves, and unless the heart is working properly the whole nerve system is liable to become unstrung, and the heart itself become affected.

Milburn's Heart and Nerve Pills will build up the unstrung nervous system, and strengthen the weak heart, so that the sufferer will enjoy the very best of health for years to come.

Mrs. John N. Hicks, Huntsville, Ont., writes: "I am sending you my testimony for the benefit I have received from using Milburn's Heart and Nerve Pills. As a nerve and heart builder they have done wonders for me. At times my heart would beat violently, and my nerves seemed to be all out of order, but after using a few boxes of Milburn's Heart and Nerve Pills I feel like recommending them to others that they might receive benefit as I did."

Milburn's Heart and Nerve Pills have been on the market for the past twenty-five years, and are universally considered to be unrivalled as a medicine for all disorders of the heart or nerves.

Milburn's Heart and Nerve Pills are 50c per box, 3 boxes for $1.25, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

England conscience which sometimes insists on punishing its owner for wrongdoing by self-humiliation which no one else knows anything about.

She felt sure that when John came home he would bring Uncle Silas. So she set about getting a supper that would be a sort of celebration of his home-coming. She made some of the tea biscuits he was so fond of, and baked a pan of gingerbread which he had often said "beat new-fangled cakes all holler," and then, as a finishing touch of welcome, she made a great bowlful of loblolly. This was Uncle Silas' favorite dish. It consisted of milk brought to a boil and thickened with a little flour, with a seasoning of cinnamon, after which a generous bit of butter was added, also a cupful of thick cream, and just enough sugar to give it a sweet taste. Uncle Silas had given her the recipe as he had written it down in memory, from childhood days, when his grandmother delighted in making good things to please the appetites of her grandchildren. Martha felt that he would appreciate the motive which prompted the preparation of this delicacy, and that he would accept it as an unspoken apology on her part. It would be a good deal easier to set herself right with him in that way than it would be to tell him, in so many words, that she was sorry for what she had said to him.

By and by John came, and sure enough, Uncle Silas was with him.

Martha grabbed up Dolly and ran down to the gate to meet them.

"Here's a girl that's glad to see you back, Uncle Silas," she said, holding out the child like an olive brnch of peace.

At sight of the child the old man's face lighted up as the sky does after a shower, all radiant with a welcome too sweet for words, as he took her in his arms and kissed her over and over again. All at once he hid his face in her flaxen hair, and Martha knew that he was crying. She turned hastily away and wiped her eyes on her apron, while Dolly, happy at last, put her chubby arms about the old man's neck and clung to him as if she never meant to let him get away from her again.

"I declare, it seems good to get home again," said Uncle Silas, as he dropped into his old rocking chair. "They was jest as kind as they c'd be to me, over to Cousin Oliver's, but somehow a home don't seem jest what it o't to be if there ain't any little folks in it," and he snuggled Dolly's dimpled face against his seamed and withered one, with a long sigh of content.

"It seems good to see you in your old place again," said Martha. And that was all that was ever said about the matter between them.

When John came in from the barn, and they sat down to the supper table, Uncle Silas's face was fairly radiant as Martha sat the bowl of loblolly beside his plate. "My! but that looks good," he said. "An' it tastes better'n it looks. I don't know whether it's all in the loblolly or the knowin' that you tho't of an old man's whim that makes it taste so good, Marthy. I wouldn't wonder if 'twas that that gives it such an extry flavor."

After supper Uncle Silas took his rocking chair out on the veranda and rocked Dolly to sleep. Martha smiled softly as she heard him singing the old hymn he loved so well:

"There is a land of pure delight
Where saints immortal reign.
Infinite day excludes the night,
And pleasures banish pain."

"Dear old soul, he's happy," she said. "And I guess I am, too. I've learned a lesson that I hope I'll never forget."

KEEPING RANGE CLEAN

I am sending my method of keeping my steel range clean, as it looks like new after using it for six years. Black-lead iron part as usual. Nickel and sheet iron to be washed with 1 qt. soft water, 1 teaspoon coal oil, stove to be just warm. Do small portion at a time and polish with dry flannel. Do not wait till it dries. Stove will keep clean if rubbed with dry cloth every day, using different cloths for nickel and iron. By taking care when frying meat to have lid on, stove will keep clean for a month.—Mrs. A. H. A.

BRUSH AND COMB CASE

A home-made brush and comb case is made from a good sized cigar box. Take off the top and carefully cut one-third of the box off lengthwise, through each end and along the bottom. Now nail these two pieces to the top part and insert a small eye to hang by. After washing off all ppper and slowly drying, stain or varnish, and you have a handy, handsome case with little labor and nice enough for any room. Same can be used for letters if so desired.—Miss E. A. L.

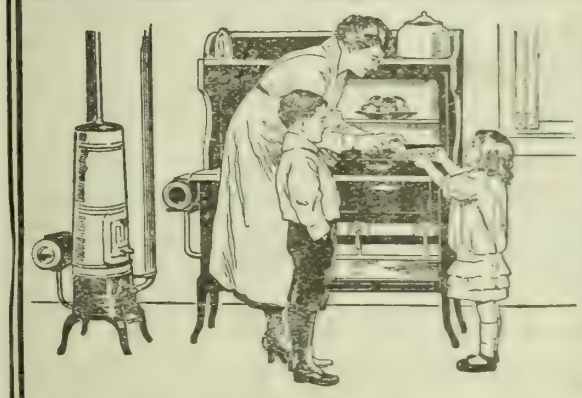
RACK FOR PIE TINS

A very useful holder or rack for a number of pie tins is made by two uprights short enough to go in between your pantry shelves. Now cut as many shelves as you want, each the width of the upright and a couple of inches longer than the diameter of your pie tin, and nail them between the uprights at intervals of two inches. As you take your pies from the over put each one on a shelf of your rack. Besides cooling much more quickly, they will take up much less space on your pantry shelf, and the rack can be moved to any shelf.—Miss E. A. L.

TASTEFUL SATISFYING

You'll Like the Flavor

40c, 45c, 50c per pound



As soon as YOU have a "Florence Kitchen", cooking will be a real pleasure. McClary's Florence Blue Flame Oil Stove is always instantly ready when you want to cook. The heat is all used for cooking and cannot make a hot kitchen in summer.

You can keep one—or four—burners at an intensely hot flame, or at a mere simmer. To regulate the heat you turn a lever according to a dial.

McClary's Florence oil stoves are clean, safe, economical, reliable. No wicks to trim nor valves to leak. The oil supply is automatically constant.

McClary's ovens are perfect bakers.

Ask your dealer to show you the Florence. If he cannot, write to our nearest branch.

HOMESEEKERS' EXCURSIONS VIA CANADIAN GOVERNMENT RAILWAYS

To Manitoba and the Canadian Northwest

Excursion tickets will be sold every Wednesday until October 25th to Winnipeg, Regina, Saskatoon, Calgary, Edmonton, and numerous other points in the Canadian Northwest. These tickets will be good for return within two months from date of issue. Full particulars can be obtained from any Ticket Agent of the Government Railways.

Holders of these tickets have the privilege of travelling by the new "Transcontinental Line" via Toronto, North Bay, and Cochrane, Ont., to Winnipeg. Homeseekers' tickets reading via this route are good for stop-over at Cochrane, Ont.; Hearst, Ont., and any intermediate station on Canadian Government Railways. Side trip tickets may also be purchased at Cochrane from points on the Canadian Government Railways east to, and including Doucet, Que., at special low fare. These privileges will permit passengers to inspect the famous Clay-belt of New Ontario, a rich farming country, opened up by the new line of the Canadian Government Railways.

HEADING OFF NEURASTHENIA

Practical and Authoritative Advice—By Dr. W. Peabody Bartlett

Unless you can control yourself, body and mind, you are on the fair way to neurasthenia, that most dreaded of nervous breakdowns. The person who cannot control himself is sick, using the term "sick" in its broadest sense. More people are harmed by the emotion they cannot control than by hard work, and it is easy to recognize the victims of uncontrolled emotions.

Worry and fear and the grosser appetites are the evils that overcome us, and they succeed only in inverse proportion to our enlightenment. They thrive at their best through ignorance of the facts of life, and they cannot withstand intelligent examination.

If you are perfectly well and normally intelligent, all the forces of these evils ought not to prevail against you. They who are really controlled by the body and abnormal mind, instead of themselves controlling, lack physical, mental, and moral strength—although the lack of moral strength is in itself frequently a form of illness.

Such people are easily annoyed, grieved and frightened. Trifling causes constantly set up the emotional reactions of fear, anger, etc., within them. The prevailing mood with such people is one of more or less disguised depression and "grouchiness." The brain becomes so sensitive to slight annoyances that what would ordinarily not be noticed by a normal individual, or noticed very slightly, excites disturbance and disorder of all the bodily functions.

These people become the slaves of their immediate surroundings. They worry and have apprehensions, selfish indulgence becomes a troat. Such people cannot be said to be well. Their condition is readily recognized by physicians as unnatural and diseased. They have no masterful control over their bodies and minds, such as strong men and women should have.

Self Control is Normal

Those who, to a very large extent, lose emotional control of themselves, become the patients whose fatigue is identified by medical men under various names. Thus we have the "neurasthenic," the "psychasthenic," the "hypochondriac," and other classifications. These are "fancy names" for nervousness, irritation, and melancholy. There is an "anxiety neurosis" now described, in which the most deplorable nervous fears prevail. The neurasthenic fears to cross an open space, or he dreads a crowd, and cannot control his fears. He is controlled by them. The psychasthenic pictures a cause for emotion which has no existence for the particular patient, but which, if real, would affect a normal mind. They are the victims of their own imaginations in a special sense. The hypochondriac thinks he has heart disease, or is threatened with apoplexy or insanity. And so it goes.

The normal person controls the intensity and duration of these emotional spells, because he or she knows the actual value of them. Certain books that we read, certain plays that we see, set up reactions of anger, grief, etc., yet mental equilibrium is quickly regained. But the nervous person puts himself into the place of one placed by author or playwright in some situation of horror, and suffers accordingly. It overshadows his life for an abnormally long time. The emotion becomes harmful because it lasts. There is no normal reaction.

The neurasthenic, or nervous person, will dwell upon some slightly unpleasant incident of his life, lie awake at night brooding over it, and build new fears upon it. In other words, the grave neurasthenic is likely to have increasingly worse symptoms. His ordinary fatigue may be mostly physical, and to only a slight extent mental at first, but later he becomes a mental and physical wreck solely because he cannot control his mind.

It is easily seen from the foregoing how important it is to keep control of one's self. The "neurasthenic" or mildly nervous person, is one who has lost that control in a small degree, the "psychasthenic" is one who has lost that control in a larger part, and the insane patient one who has lost is completely.

The immoral person is ignorant, one who understands neither his relations to the sensual brute of the past ages nor his obligations to our present day standard of manhood. In the midst of moral evoltuion he is morally, and, in a sense, physically sick—only he doesn't know it as the ordinary neurasthenic knows it. If he were well he would control his passions, such control being the sign of health. There is more reason why he should consult a physician than that the neurasthenic should. Society ought to be more concerned about this type or sick man than about hookworm.

Over-sensitive, emotional tendencies ought not to be encouraged. In other words, all controversies should be avoided. Morbid sensations and emotions must be resisted intelligently. The reason why the treatment of the conditions under discussion is so unsatisfactory is because the patient is handled upon a physical basis.

Too many physicians ignore the fact that emotions which the sufferer cannot control are at fault, and mistake the case for neurasthenia. There is a school of physicians which insists that these conditions in people are not due to inability to control mind, but rather to tuberculosis and other diseases. So they doctor them altogether physically, they bathe their patients or order them not to bathe, they rest them or work them, they are given stimulants like strychnine, or they are given sedatives. And so it goes.

Comments are not necessary here, for the fact remains that while some of these patients treated under this belief get well, it is only a bodily cure, and they soon relapse, because it was their minds which were faulty, and these minds were not cured. In this particular instance the word cured means that the people were not made to understand the real cause of their trouble, and were not helped to control their minds.

If you have neurasthenia you may be sure of one thing: you are intelligent. No dull-witted person ever suffered from that trouble. No person of a low grade of intelligence ever suffered from highly nervous disorders whch made it impossible for them to control their minds. And it is a sad sight to see these intelligent people becoming wrecks, mentally and physically, simply because they have not been taught that their trouble lies in their inability to control their minds. They should be taught that as soon as they begin the practice of controlling their minds they begin to recover. If they knew how, they would throttle those evils that make them so ill.

But those evils do not have to be throttled. Let the sufferers begin to think calmly and sanely, let a flash of enlightenment reach them as to the truth of what the trouble is, and the sufferers begin to control their minds.

To tell a person to use "will power," and to go no further in your advice, is like tossing a child in the water, telling him to swim, and then walking away. It is quite true that will power is necessary, but for the persons just described the exercise of will power outright is practically impossible.

The way to lead up to proficiency in using your will power is to start with some simple little training. As previously explained, the person who is ill through inability to control the mind becomes nervous, morbid, melancholy, angry, worried, or frightened, and whichever of these emotions may be

uppermost, the cause has been the same—some little incident. It may be from reading, it may be from seeing a play, it may be from witnessing an accident, it may be from hearing gossip, or a hundred and one other causes whereupon the unfortunate begins to suffer.

When the neurasthenic is in this condition, he or she, being intelligent, knows right down in the heart that there is no necessity for "going to pieces." The instant you get into a tantrum or a melancholy spell, stop for a moment. Then commence to breathe regularly. Take out your watch and inhale during two seconds. Then exhale during two more seconds. Measure your breathing in this manner for five minutes or ten minutes. Then say to yourself that you have got control of your mind. The chances are this will be true, and you will laugh at the trivial little incident which a few moments before had so worked you up. This exercise is especially good for overcoming the jerky and gasping respiration resulting from fear and anger.

If you are frightened over some trivial incident, sit down and grin at yourself in a hand mirror for ten minutes. This may seem absurd, but it is not one fraction as absurd as allowing some silly little notion to get control of your mind and thus affect your body. If you have melancholy spells, go to your room and practice a few tango steps. Look at yourself in a mirror and see how clumsy you are. All of these things take your mind off the troubles that are bothering you, and they lead gradually to a time when, if any little events affects you, you can say to yourself: "It is trivial. I will forget it," and you do forget it.

When you are ready to do this you will have acquired will power. You go into the water repeatedly and thrash about until you finally learn to swim. You cannot learn with the first plunge—and so it is with your will power. If you have allowed your mind to control your body until you are a neurasthenic, or at least until your body and mind are slightly affected, you cannot exert your will power in the flash of a moment by means of a thought. You must practice just as you would practice at swimming. Practice at the little thin just described, and in time you will have gained complete control of your mind.

Dangerous Conditions

Probably two-thirds of the neurasthenics do not know that they are in this dangerous mental and physical condition. There is the story of the old maid who suddenly began weeping. There was apparently no cause for this, and when she was asked why she was shedding tears she said, between sobs, that she was thinking what a terrible thing it would be if she should ever get married and have some children, and they would be playing on the banks of the river and fall in and be drowned!

She was a neurasthenic.

I know a woman who lived in an aristocratic neighborhood in a large city. Her husband was out of town when he dropped dead, in a hotel, of heart disease. It fell to my lot to break the news to her, and, as gently as possibly, I told the woman how her husband had so suddenly died. I was all prepared to catch her as she fainted, but I did not have to do so. She looked at me, and said: "Chetney dead? Just fancy!"

This woman could certainly control her mind. She was far from a neurasthenic. I know that she loved her husband, but she had lived all her life among people who prided themselves upon their ability to hide every emotion, and when the big crisis came, she—at least to my way of thinking—overdid it.

But if you are careful to coax yourself out of every little mental disturbance, just as the suffered from insomnia counts sleep jumping over a stone fence in order to get to sleep, it will not be long before you will be able to control your mind, and thus restore your emotional health. Your emotional health once restored, your physical health will take care of itself, and you will soon become normal.

Always remember never to let any emotion, whether it be grief or joy, anger or fear, melancholia or hysteria, get the better of you. In other words, do not let your mind control you. If it is too late for this advice, then go back to my other advice, and gradually win control over your mind. Once it is under control, "never lose your grip," and you will have safely driven away or head off neurasthenia.

SALADS TAKE THE PLACE OF BITTERS IN THE SPRING

By Catharine C. Creamer

Salads have come to be so generally used, and made of such varied combinations of meats, vegetables, and fruits that the name ceases to suggest only the raw salad plants with sour dressing, or the "something to be eaten with salt," as the name implies.

The simplest salads are the oldest and best known, and consist of tender leaves, stalks or young tips of plants which may be well seasoned and eaten without cooking. The green vegetables used in this way do not contain very much real nutriment, for they are principally water, often as high as 90 per cent. They do contain some mineral salts, such as potash, lime, phosphorus, and iron, which are valuable additions to the diet, for they help to keep the blood in tone and to maintain a healthy condition of the whole body. Cooking such plants involves a great loss of this valuable mineral matter, while the fresh and attractive appearance of the green plants serves as an appetizer for the more substantial part of the meal with which the salad is served. Then, too, the large

Winnipeg, Man. Hamilton, Ont.

amount of woody material or cellulose in these green plants acts as ballast or gives bulk to the food and thus aids a sluggish intestine. Hence a craving for these foods should be recognized as representing a real need of the body, and raw salad plants may be looked upon as a splendid substitute for the "spring bitters" in which the housewives of an earlier day placed so much confidence. Especially in the early spring days, when the diet of winter vegetables and meats has grown monotonous, is the refreshing green vegetable salad most appreciated. Although these plants may be purchased the year round on market in the cities, their use out of season makes them a luxury, except at this time of year, when their real value to the body justifies their place in the diet.

Lettuce, cabbabe, and celery are the most common salad plants, and may be easily prepared. The greatest care is needed in cleaning these foods, which are to be eaten raw. Separate each leaf or stalk and wash in running water or in several waters so that the fine particles of sand, tiny insects, or other parasites, and any germicide powder which may be clinging to the plants, will be surely disposed of. Then loosely wrap the clean plants in a cloth wrung out of cold water and lay away in a cold place until needed. In this way all of the freshness and crispness will be retained. Never place the stalks in water for any length of time, for they soon become water soaked. Lettuce in the head variety is a most acceptable salad in itself and is most frequently served with French dressing. The long leaf variety is more often wilted with a hot sour dressing, and the curly lettuce usually appears as a garnish for more elaborate salads. Cabbage should be chopped and then seasoned with a bit of green pepper or ripe pimento and mixed with French dressing. Such a salad is as simple as it is wholesome. A sour cream dressing is also very desirable.

The cabbage salads are not sufficiently appreciated or they would be used more frequently. These plants should all be cultivated in a very rich soil with plenty of water and sunshine, for the quicker they are grown the more tender the leaves and stalks will be.

Often the stalks are covered in order to bleach them, as is done with celery and endive.

Fruit Salads

While these are the real salad plants, there are as many salads made without them as with them. The fruit salad, usually served as a dessert, has become very popular. There are many good combinations possible, and the ingenious housewife will be governed by the materials at hand rather than by the directions of a cook book. Oranges, bananas, pineapple, grapefruit, cherries, white grapes, and apples offer many possibilities, and nuts and sometimes marshmallows are a good addition. A cooked cream dressing, or preferably a sweet fruit dressing, is used in mixing them, or occasionally the fruits are mixed and served without any dressing. When a fruit salad is prepared in place of another dessert, it is quite unnecessary to serve a vegetable salad with the rest of the meal.

Meat and Vegetable Salads

While the real salad plants and greens are generally served as an appetizer with a meat course, or to take the place of the second vegetable in the meal, there are many concoctions of meat and vegetable salads which may well constitute the main dish of the luncheon or supper. In this way many bits of left-over meats and vegetables may be attractively served and materials made use of which might otherwise be wasted.

Meat for salads should be freed from skin and gristle and chopped rather finely. Chicken is considered the most delicate salad meat, although meat left from a roast of pork or veal can be substituted in part or entirely, and few persons can detect the difference. Left-over bits of fried ham may be ground or chopped and combined with celery and dressing to form a most appetizing salad. Salmon, or occasionally white fish or lobster, may be flaked and used with hard cooked eggs, celery, and moistened with a cooked cream dressing. The meat salads are to be commended because they provide the flavor necessary to make a meal appetizing, without the

AND FOUND A CURE IN DODD'S KIDNEY PILLS

Mrs. Patrick Williams Tells Why She is Advising Women Who Suffer to Use Dodd's Kidney Pills.

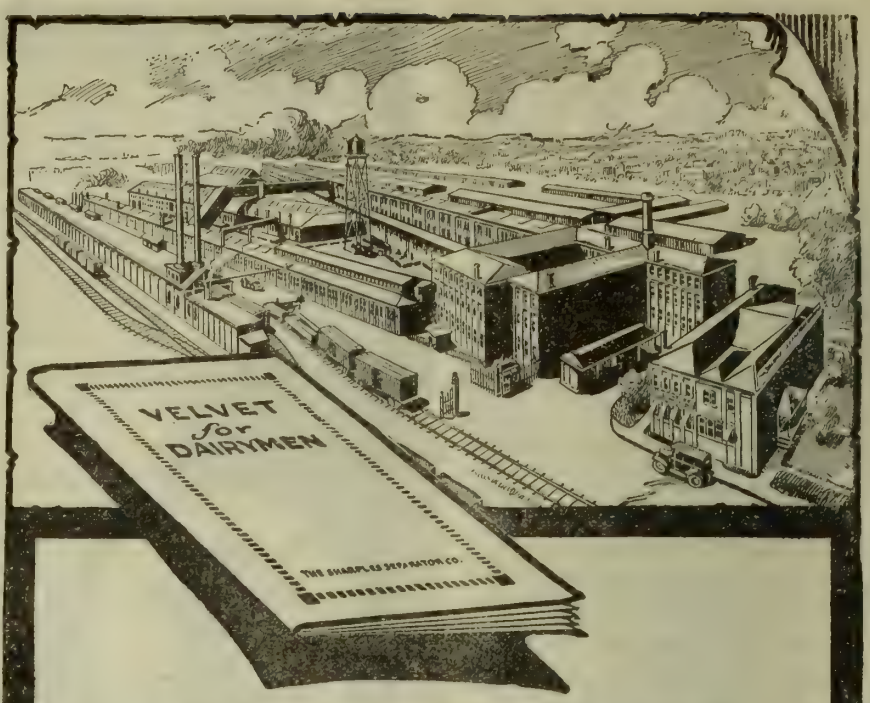
Adamsville, St. Sosime, Kent Co., N. B., May 25th (Special).—Mrs. Patrick Williams, well known here, is advising her numerous friends to use Dodd's Kidney Pills.

"I had been far from well for about two years," Mrs. Williams says. "My troubles started with a cold. I never seemed to get over the effects of it. I had cramps in my muscles and my joints were stiff. There were dark circles under my eyes, which were puffed and swollen. I had a bitter taste in my mouth, and I suffered from severe headaches.

"I felt heavy and sleepy after meals and had attacks of neuralgia. Heart flutterings added to my anxiety, and finally rheumatism set in.

"It was then I was advised to try Dodd's Kidney Pills. I cannot be too glad I did so. I took just three boxes, but they did me so much good I feel I can recommend them to every woman who suffers."

Dodd's Kidney Pills act directly on the kidneys. Every one of Mrs. Williams' ailments was a symptom of disordered kidneys. Dodd's Kidney Pills cured them all by curing the kidneys.



More Dairy Dollars

We have found a way to bring you more dollars without increased expense. We call this new profit "velvet," because it comes so easily. Our new book, "Velvet for Dairymen" tells all about it.

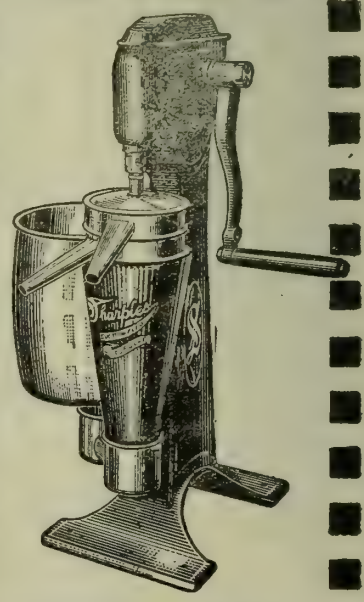
Your separator is losing cream, no matter what the make. A famous experiment station says, "*The use of the gravity can, a low speed of the separator, and an excessive rate of inflow cause heavy loss in butter fat.*" They have proven that 95% of all farm separators are turned below regulation speed. When the speed slackens, a lot of the cream escapes with the skim milk—and with the cream goes the profit.

The annual loss from imperfect separation is $47 on the average farm and upon many farms it is $100 and more. That's the tax you pay because you can't turn your separator at just the right speed all the time. But with

THE NEW SHARPLES SUCTION FEED

Separator you get all the cream at any speed.

A wonderfully simple invention enables the bowl to *drink in just the right quantity of milk* to insure the closest possible skimming. You may turn slow and make the work easy or you may turn fast and get through quicker. You simply won't lose cream with the "Suction Feed."



You get smooth cream of an even grade whatever the speed of the separator. Uniform cream makes fancy butter that brings top prices.

The supply can is only knee-high. There's no hard lifting to empty heavy milk cans.

The new machine has all the features that have made the Sharples Tubular famous and many other new vital and exclusive features found in no other separator.

Send now for our new book, "Velvet for Dairymen," and learn how to secure this new dairy profit. Address Dept 79

The Sharples Separator Co.

Toronto - - - - Canada

expense of a regular meat dish.

The best-known vegetable salad is one made of cold boiled potatoes and hard cooked eggs with some celery and plenty of sesoning and dressing. Although it is a salad frequently made, it is seldom as attractive as it should be. Much depends upon the materials being carefully prepared and well mixed or "tossed together," as some good cooks will say. Cut or dice the materials in uniformly sized pieces, have all of the ingredients well chilled before combining. All meat and vegetable salads are improved in flavor if, several hours before adding the regular dressing and serving, the materials are seasoned with salt, pepper, oil, and vinegar. This is spoken of as marinating the salad.

Beets cooked until tender are sometimes cut in cubes and served with cabbage on lettuce leaves. A salad is also made by combining diced carrots and peas. The raw carrots cut in small cubes are a good addition to many salads and can be had the year round. Asparagus tips cooked until tender may be used with lettuce and French dressing, and occasionally string beans are appreciated in the form of a salad. The use of chopped onion for flavoring salads will depend upon the personal taste. The likes and dislikes of the people to be served must largely govern the housewife in preparing salad combinations. A well made and mixed salad is an addition to any menu, for noon or evening meal.

Salad Dressings

Almost as much depends upon the kind of dressing used and the way in which it is prepared as upon the ingredients of the salad itself. The most popular dressing is one correctly called a "cooked cream dressing"—not a mayonnaise. This is made as follows:

Mix together 2 tablespoons of flour, 1 tablespoon of sugar, 1 teaspoon of salt, and 1 teaspoon of mustard, and add to the beaten yolks of 3 eggs or to 2 whole eggs. Then add slowly one-half cup of vinegar, diluted if necessary, cook until very stiff, stirring all the time. Remove from the fire and add 1 tablespoon of butter and cool. A glass can is a suitable place for keeping this dressing, and it can be kept several weeks if necessary. For use, thin with sweet or sour cream, or with whipped cream. By increasing the amount of flour, this can be made with only one egg. This dressing is very generally liked, and can be used with any salad.

The sweet fruit dressing for fruit salads only is prepared as follows: To 2 beaten egg yolks add one-half cup of strained honey or maple syrup, 1 tablespoon each of flour and sugar, and the juice of 2 lemons, and cook in a double boiler until it thickens slightly. Cool and add 1 cup of whipped cream just before serving.

Oil Dressings

The regular mayonnaise and French dressings both require large amounts of oil. To many people this is distasteful at first, but one can cultivate a taste for it, and should do so if possible. The body is just like any other piece of machinery and needs lubricating once in a while to keep it in good running order. There is nothing better for this purpose than olive oil. The food value of the whole salad is greatly increased by the addition of a dressing rich in eggs, olive oil, or cream. The best olive oil is expensive, costing at retail about $1.00 a quart. The Spanish oils are perhaps the strongest in flavor, the French and Italian oils are more mild. Equally as nutritious and just about half as expensive as the olive oil is a good grade of cotton seed oil. It is very mild in flavor and makes a most desirable mayonnaise. Any oil for table use should be kept in a cool, dark place when not in use. Cultivate a liking for oil dressings, for they have an actual medicinal and high food value.

Production and Thrift

"GAIN or no gain the cause before the farmers of Canada is as clear as it was last year—they must produce abundantly in order to meet the demands that may be made, and I believe this to be especially true in regard to live stock, the world's supply of which must be particularly affected in this vast struggle."—*HON. MARTIN BURRELL, Minister of Agriculture.*

THE FOLLOWING STATEMENTS ARE BASED ON REPORTS CONTAINED IN "THE AGRICULTURAL WAR BOOK, 1916," PUBLISHED BY THE DEPARTMENT OF AGRICULTURE, OTTAWA, ONT.

LIVE STOCK—The herds and flocks of Europe have been greatly reduced. When the war is over there will be a great demand for breeding stock. Canadian farmers should keep this in mind.

MEATS—In 1915 Great Britain imported 664,508 tons of beef, mutton and lamb, of which 364,245 tons came from **without** the Empire. Out of 430,420 tons of beef only 104,967 tons came from **within** the Empire.

The demands of the Allies for frozen beef, canned beef, bacon and hams will increase rather than diminish. Orders are coming to Canada. The decreasing tonnage space available will give Canada an advantage if we have the supplies.

DAIRYING—Home consumption of milk, butter and cheese has increased of late years. The war demands for cheese have been unlimited. The Canadian cheese exports from Montreal in 1915 were nearly $6,500,000 over 1914. Prices at Montreal—Cheese: January 1915, 15¼ to 17 cents; January 1916, 18¼ to 18½ cents. Butter: January 1915, 24 to 28¾ cents; January 1916, 32 to 33 cents.

EGGS—Canada produced $30,000,000 worth of eggs in 1915 and helped out Great Britain in the shortage. Shippers as well as producers have a duty and an opportunity in holding a place in that market.

WRITE TO THE DOMINION DEPARTMENT OF AGRICULTURE AND TO YOUR PROVINCIAL DEPARTMENT FOR BULLETINS ON THESE SUBJECTS

Tens of thousands of Canada's food producers have enlisted and gone to the front. It is only fair to them that their home work shall be kept up as far as possible. The Empire needs all the food that we can produce in 1916.

A SUCCESSFUL OCTEGENARIAN FARMERESS

(Continued from page 523)

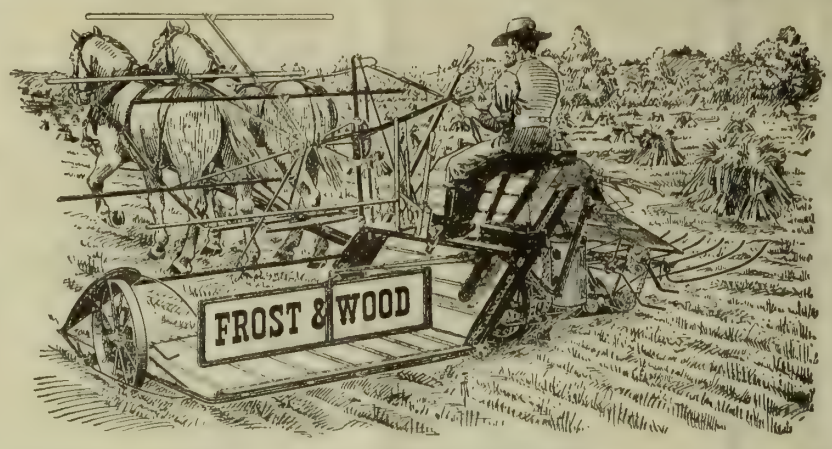
indeed wonderful of a woman of 83 years of age. She never fails o visit the stables and all the animals once or twice a day. In the spring of the year she is up and about at 5 o'clock, and sees to the horses, as well as to the calves and the lambs, and has breakfast at sharp six for the men that they may be able to get to work by seven o'clock.

She is up-to-date in her work, has all the modern tillage implements, good gear for the horses, has built since taking charge four barracks for storing grain and hay, the barn being somewhat small and of poor storage capacity; has fixed up and put necessary repairs on the barn, and also on the dwelling; has purchased two splendid horses in the last four years, paying high prices. She pays spot cash for everything, and sells only for the same. She uses her men well and pays promptly. She is a business woman in every sense of the word, and a hard-working woman at that.

The spinning wheel and the knitting needles, which are rare objects in the modern farmhouse, and curiosities to some, are to be seen with Mrs. McDonald. She spins, from the wool of her own sheep, the thread for socks and mittens, and then knits them to finished articles as mittens, socks, etc. She also had time to spin the thread to make the "filling" for a piece of "druget" to be woven by a weaver for a dress for herself. The writer was shown a dress just completed by a Souris lady tailor, which was made from "homespun," spun for herself. This "drugget" was dressed at the mill (carding) and was shown last fall at the Souris Fair. None would ever imagine it was "homespun."

This woman also finds time to read the daily papers, of which she gets two, a religious weekly, and several agriultural papers. She keeps accounts of everything, outgoes and income, and attends church on Sundays in the summer season fairly punctual. How a woman in her 84th year can accomplish so much work is truly a marvel.

"I haven't time," she says, "to think that I'm getting old."



A Binder is a big investment

The man who buys one without investigating the Frost & Wood is throwing away the 25 years of fruitful experience we have had in making Binders, and seeing them used for all kinds of crops all over the world.

The Voice of Experience Talks Loud in Frost and Wood Binders

Building Binders has always been our special study. We watch our machines at work more critically than any individual owner, and we are satisfied that for sure cutting, sure elevating, sure tying, light and fast work the Frost & Wood Binder cannot be equalled.

LIGHT-DRAFT—EASY WORK

The Frost & Wood Binder is built of high-carbon steel, displacing heavy cumbersome castings and wood. It can stand a drop into a hollow, it can stand work in the roughest land, it will handle any crop you ever saw with ease. It has a big margin of strength, yet it is the lightest in draft on the market due to our extensive use of the finest roller bearings, expensive for us to give but mighty good for you to have. No pulling or straining to work the handily-placed levers, either. We place strong helper springs to do the work for you.

SPECIAL CUTTER BAR

Knives are on the same level as platform canvas, so no short grain is lost. Platform and cutter bar readily tilted so as to just skim the ground and get every straw. Knife blades easily changed when necessary.

FORCE FEED ELEVATORS

The old bugbear, choked grain, is entirely done away with. Frost & Wood elevation is positive—the grain must pass, no matter how tangled it is. A special Relief Roller, always revolving, passes the straw from elevator to packers and "keeps things moving."

RELIABLE BINDING ATTACHMENT

Can be adjusted to give large or small bundles exactly as you wish. The whole machine is built to suit any harvesting condit on. The Knotter is a wonder of simplicity and sureness. Hundreds of letters from satisfied users always comment on the splendid F. & W. Knotter. Many F. & W. Binders have been in use 15 and and 20 years and are in excellent shape to-day.

Put time and thought into buying your binder. Write us today for our special Frost & Wood Binder Book.

MONTREAL, SMITH'S FALLS, ST. JOHN

THE CLARION CALL

Last year Canada responded magnificently to the call of the Empire. The soil was cultivated to its utmost limit, with the result that a bountiful harvest was reaped. Boys and girls united with their parents in showing the good will and the proud national spirit that they possessed. They bent their energies towards making the land produce all that it was capable of doing. The times were not financially good, and bitter experience had been had with crop failure in the previous year. Nothing daunted, they went to work with determined will and persistence, and they reaped where they had sown. When the crops were gathered granaries were full to overflowing. Canada had cause for the celebration of the greatest, most intense, most earnest thanksgiving she had ever known. That there was no unmindfulness of the source from which all blessings flow was shown in action as well as in words. Patriotic gifts came from many directions in many ways. The women worked with life and love. They gave the fruits of their labors, and they gave their offspring. The men devoted their acres and their services to the cause of the Empire. Boys and girls cultivated what they termed war plots, the yields from which went towards filling the exchequer of patriotism. There were slackers then, there were Scrooges then, there are the same elements today; but the evidences of sympathy far overshadowed the discordance, and such a front of union was displayed as commanded the respect and admiration of the world.

This year there must be no backing up. Even the unwilling of last year, the Scrooges, and the men and women who put personal profit before love of country, must, if possible, be brought into line. The situation is more intense than it was. There is more suffering, there are more widows and orphans, and there are twice as many men on the fighting line and under arms. As the war progresses the slaughter becomes greater, more shipping and more property are ruthlessly destroyed, and the cry for help is keener. Were it not for the British Navy our allegiance would cost us dear. Were it not for the united armies and for the organization for protection from assassins, traitors, and incendiaries that exist in our own land we should be at the mercy of the same cruel and barbarous forces that have overrun and laid waste Belgium, Poland, and Serbia. We should be taxed beyond all bearing. We might even practically be slaves, working not for ourselves, but for tyrannical taxmasters, for men compared with whom —judging from some of their actions— Legree, the novelist's type of a brutal, cruel slave driver, was, in deeds of villainy and harshness, no worse.

The future of the Empire rested in a large measure with Canada at the beginning. It rests with us to a greater extent now. We have increased our responsibility. We have voluntarily added to the weight of our share of the titanic burden. We must bear the self-imposed load cheerfully and generously. We must show our worthiness of the trust assumed. We must prove our appreciation of the high and honorable partnership into which we have entered. We must do all this, and we must perform our tasks with, if at all possible, increased zealousness. To halt or pause would be fatal. Our works of charity must continue to the full and be added to. Our eye, not only on the present, but also on the future, must never hesitate or waver. When peace comes, our granaries and our stalls must be full.

Today we are called upon to do our share of the fighting, to care for the sick and wounded, to honor the dead, and to admire the living hero—and they are all heroes who go forth; tomorrow we may be summoned to replenish the earth, to help in the arts of peace, and to do all we can to assist in repairing the terrible ravages of a war that has taken on such proportions in magnitude and savagery that even "Armageddon" is scarcely thought a fitting descriptive term. In short, it is our duty to be prepared for any and every eventuality, both present and future. At war, we are yet not at war. We can plow, sow and reap, and tend our flocks and herds undisturbed by the thunder of artillery. We can carry on our industries without let or hindrance. We can win glory on the battlefield, or we can live our own lives amid peace and plenty. All that is demanded is remembrance of our country and truth to ourselves. That is the clarion call.

SUMMER SCHOOL JULY AND AUGUST — GEO. Y. CHOWN REGISTRAR

WHY WE SHOULD SAVE, AND HOW

A pamphlet has been issued by the Parliamentary War Savings Committee in Britain, entitled "Why We Must Save, and How." As it is intended to illustrate the possibilities of saving by all classes, there are necessarily many hints calculated to be of value the world over and especially in affiliated countries. In the first place, it combats the notion that these people who spend all hey make are necessarily benefitting trade. On the contrary, those who save wisely advantage themselves, their neighbors, and their country. Spending money on luxury gives a certain amount of employment, but nothing like the employment that investment in desirable and necessary articles does. The best way to convey the meat in this useful and timely pamphlet would seem to be to sum-

PILES CURED at HOME by NEW Absorption Method

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

GURNEY-OXFORD PRINCE

Here is Stove Value Never Seen Before

You can now buy this splendidly built, fully guaranteed, cast iron Range from the factory or our dealers on a 100 days' approval, freight paid to any point as far west as Ft. William, for the new low price of $25.75

This may sound a very low price for a stove of the admittedly superior Gurney-Oxford make. So it is, but the value is there. The "Prince" at $25.75 freight paid is the wonder of the stove world. It is possible only through our improved methods and enormous production.

Built for Years of Service

At anything like this price you have never seen such solid construction and so many splendid features built into any stove. In all our 70 years expert experience we have never known better value, and our profit on each sale is extremely small. Only the resources of our huge foundries, the largest makers of stoves, heating apparatus, etc., under the British flag, are equal to the task of producing the Gurney-Oxford "Prince" for you at $25.75 freight paid.

Gurney Quality All Through

No matter how low our sales department sets the price it does not affect our foundries. They will not permit any Gurney-Oxford stove to go out until it has been tested and measured up to the rigid Gurney-Oxford standards. We know you must have a stove good for well-cooked, nourishing meals more than a thousand times a year for many years and the Gurney-Oxford name demands that you get only that kind of a stove.

The Gurney-Oxford "Prince" at $25.75

freight paid is wonderful value, but every page of our new illustrated Catalogue is filled with equal stove wonders. Also tells all about our new 100 days' approval selling plan. Stove buying is a very important matter so we want you to send to-day for a copy—free. It's a splendid guide to stove buying, with new low prices and full descriptions of all our stoves, parts, etc.

What the "Prince" Gives You

Shipping weight, 410 lbs., tells its story—nothing lightweight or flimsy about this special Gurney-Oxford offering. Plain but beautiful design. Gurneys do not lavish over much nickle trimming to please the eye and then skimp construction.

Four 9-inch covers, right hand copper reservoir, high shelf, two tea-pot rests as shown, $25.75 (without reservoir $20.50) freight paid as far west as Ft. William 100 days' approval or money refunded.

Gurney's New, Low Factory-set Prices

People now realize they can buy a Gurney-Oxford Quality Stove and know what they have to pay, including freight, all with the fullest guarantee of quality, satisfaction and safety, without any uncertainty, bother or dickering. One price to all, whether you buy direct from us or from our nearest dealer.

Send for this

This Free Book

Tells how and why the great Gurney Foundry Co'y fixes new low factory prices on all Gurney-Oxford Stoves, etc. It is a splendid guide to Stove buying. Send for it to-day. Use the coupon.

Name .....

Address .....

marize its contents in brief, emphatic sentences, as follows:

Thrift is a national duty, so that the money thus saved may be invested with the government.

The more goods we buy at home, and the more we make and send abroad, the richer the country becomes.

Every dollar borrowed abroad that might be obtained at home means money going out of the country.

By devoting all our energies to producing things useful and abandoning the purely ornamental and the luxurious we are helping the country.

Women are the main power in the campaign for thrift. As leaders of the home, they can best foster economy in food and clothing.

The only money judiciously spent is that that keeps ourselves in health of mind and body, and that by investment in productiveness helps in the progress of he land and the country.

Reduction in meat eating might be generally practiced without loss of strength.

Cheese is one of the best and most wholesome substitutes for meat.

Economy and good digestion are aided by never eating bread that is not at least 24 hours old. Ten per cent of the cost of bread would be saved by rigidly adhering to this simple practice.

Fewer courses at dinner would not mean any wearing on the health, but less work and more saving.

It is in dress that women could best economize. Simplicity of material does not mean less attractiveness.

Excessive expenditures on weddings and funerals should be avoided.

Labor released from the manufacture and sale of things that can be dispensed with is available for other and more useful work.

Expenditure on golf, tennis, and other games of pleasure could be beneficially curtailed.

The giving of presents on all trivial occasions is to be discouraged, and, when given, they should be of an inexpensive and useful character.

Presents and gifts might take the form of war-loan vouchers.

Much money might be saved by [illegible] less on hobbies.

Neighbors could benefit each other by systematically combining to buy food in quantities and sharing it.

Economy today means riches in the future.

The only luxury the Empire can afford is victory.

PASTURING GEESE

It is sometimes claimed that geese spoil a pasture. Geese will not spoil a pasture unless too many birds are turned into too small a place. They will pasture a scanty field closely, but when they feed largely on pasture they are costing nothing for grain, and their droppings are enriching poor land.

Geese live long, and are profitable for breeders almost as long as they live. They should not get too fat for breeding.

A goose will lay one clutch of eggs, and then, if broken up, another, and even a third; but the last two clutches will be of few eggs. She will carefully cover her eggs with straw, and while brooding them is very apt to be cross, pecking with her beak and flapping with her wings the intruder who bothers her. When the goose is allowed to hatch her own eggs. the goslings should be taken out from under her as they hatch. Otherwise she is apt to crush them. As soon as they are strong on their legs they may be returned to her. Once well hatched and strong, they are easily reared. They should be confined for the first two weeks, and should be driven home every night when the goose is given her liberty.

When setting with hens, do not give more than five or six goose eggs to one hen. The eggs hach in thirty days—possibly a day earlier. When the eggs are hatched the hen must be watched, lest she refuse to accept the goslings and peck them to death. They should be removed from the nest and kept in a flanned lined basket until strong and the hatch is over. Let them remain warm and quiet for twenty-four hours after hatching; give them a little soaked bread and water. Goslings may have all the grass and clover they can peck from the very first; they are better off without much grain until they are a month old.

STICKY FLY PAPER

Mix equal parts by measure of melted rosin and castor oil. Stir until thoroughly mixed, which will take only a minute. While yet a little warm, spread thin and evenly on any strong paper that is not porous—old letters, catalogue covers, etc. Spread with a case knife or any straight-edged instrument slightly warmed. Leave a narrow border to handle with.

FEED DRY COWS

(Continued from page 529)

cow will vary from month to month. When you have learned these lessons with one cow, then take on another which is approaching her freshening period. You will perhaps run across different problems, but the principles are the same.

Our dairymen can get good lessons from watching how nature favors milk production. We all know how cows come up on their milk when turned to pasture in the spring. There are good reasons for this. The cow has all the fresh air she can breathe. Farmers should learn to feed oxygen as well as grain. Another thing, the cow gets all the sunshine there is. She is warm and comfortable. Sun and balmy days take the chill off the water she drinks. Finally, she is surrounded with succulent, nutritious feeds in as large quantity as she desires. Finally, I remind you that a cow never made one pound of milk except from the feed she consumed. If you allow her to decrease in milk flow, you will not get her back to the maximum until the next freshening period.

REMEDIES FOR GARDEN PESTS

Simple and effective remedies for two of the most common and destructive garden pests were recently outlined by Professor L. M. Montgomery, of the College of Agriculture, Ohio State University. Cucumber beetles and cabbage worms are among the worst pests the gardener has to fight. The cucumber beetle is a small yellow beetle with black stripes running down its back. It causes heavy damage not only to cucumbers, but to melons and other vining plants. One part of Paris Green to 50 to 100 parts of air slacked lime is a very effective remedy. This should be sifted over the plants in the morning when they are covered with dew. For the cabbage worm, one ounce of white hellebore dissolved in two or three gallons of water is used. This should be sprinkled or sprayed heavily on the cabbage. If some soap is added it will add to the sticking properties of the solution. The hellebore may also be applied in powder form. It is a poison of vegetable origin, and its poisonous properties are lost on exposure to the air for two or three days. This makes it necessary to repeat the application on the plants every few days.

SALT FOR CUTWORMS

When I purchased the home I now occupy—three years ago—I found the garden plot in a good state of cultivation and fairly free from weeds. However, in the spring when I planted it I found a good many white grubs in the ground and when my plants began to come up I soon learned that there was also a plentiful supply of cutworms. It was a continual fight through the spring to save my plants, but in spite of that I had a fairly successful season.

The following spring I got eight quarts of coarse salt and sprinkled it as evenly as possible over the ground about the time the snow was gone, leaving it to be dissolved and carried into the earth by the rains. In the two seasons which have followed I have only lost three plants by cutworms (did not lose any the first year), and Ihave not seen a single white grub.

At the rate I used the salt it would require about ten bushels per acre, but I think possibly less would be as effective. As there were evidently a few cutworms getting into the ground this year, I shall use about six quarts and see if it will be sufficient.

I have never seen this remedy suggested, although it may be known to others.—Geo. A. Whitney.

IRON-RUST PREVENTIVES

P. M.: There are several easy ways to prevent the rusting of ploughs and cultivators and to keep the teeth bright. One is to give them a coat of thick limewash as soon as they are brought in from the field. Another way is to dissolve 1 oz. resin in 4 oz. of linseed oil, and while hot mix this with a quart of kerosene and stir well. This is laid on the smooth iron with a paint brush. Another way is to dissolve 1 oz. of camphor in some turpentine, and add to this 4 oz. of lard and 1 oz. of pulverized black lead or stove polish, and mix well. This may be rubbed on with a rag. To remove rust from ploughs or tools, nothing is better than a mixture of one-half pint of oil of vitriol poured slowly into a quart of water, and apply this to the rusted metal. Wash out with water.

LIGHTNING ROD PROTECTION

An insurance authority, in speaking of the fire losses of April last, said: "Lightning has caused considerable loss during the month, especially throughout central and eastern Ontario and western Quebec. On the 25th and 26th of the month, 34 barns and 9 dwellings were damaged in Ontario, and on the 27th 18 buildings were struck in the province of Quebec. If inquiry were made, it would doubtless be found that none of these buildings was rodded. When it is remembered that lightning loss upon farm property in Ontario and Quebec costs the insurance companies well over $400,000 a year, and that losses not covered by insurance probably amount to a nequal or even greater sum, it seems strange that farmers do not more generally adopt so simple a means of protection as the lightning rod."

Much has been said and written of recent years as to the value of lightning rods as a means of fire protection. This question has especially interested insurance companies, who have to provide for the primary loss. When, however, insurance officials make such statements as that quoted above, it is apparent that only a small part of the ultimate loss is borne by them. Farmers, especially in eastern Canada, are paying this loss. True, the insurance companies collect the money from a large number and pay it over to those who suffer from lightning, but the farmers pay the price, as well as the cost of making the collection. The heavy loss by lightning must be provided for through an increased premium paid by farmers for their insurance. It is therefore advisable for those who must pay this heavy charge to take precautions to protect property.

The data collected by United States Farmers' mutual fire insurance companies demonstrated that lightning is one of the principal causes of fire in rural districts.

Canadian farmers' mutual insurance companies are also taking a great interest in lightning losses, and almost unanimously make a reduction in premium on protected risks.

In European countries, particularly in France and Germany, all public

Rich Powerful Nutrients. Hypophosphites, Nerve Restoratives, Valuable Stomachics.

To Cure
Nerves, Stomach, & Kidneys.

Dr. Cassell's Tablets are a genuine remedy for all forms of nerve, stomach, and kidney trouble in old or young. They are composed of carefully chosen ingredients, each one of which has definite restorative action on the nerve centres controlling the various processes of life; and thus they give new activity to the bodily organs, and new vitality to the entire system.

Dr. Ramsay Colles, J.P. of the City of Dublin, a man of high eminence in the scientific world, says:—"I have great pleasure in expressing my satisfaction as to the curative effect of Dr. Cassell's Tablets in cases of nerve troubles. From several cases which have lately come under my notice I am able to form the opinion that Dr. Cassell's Tablets constitute a safe and reliable family remedy, and appear to be specially effective for nerve and bodily weakness."

Dr. Cassell's Tablets are Nutritive, Restorative, Alterative and Anti-Spasmodic, and of great Therapeutic value in all derangements of the Nerve and Functional Systems in old or young. They are the recognised modern home remedy for Nervous Breakdown, Nerve and Spinal Paralysis, Infantile Paralysis, Rickets, St. Vitus' Dance, Anæmia, Sleeplessness, Kidney Disease, Dyspepsia, Stomach Catarrh, Brain Fag, Headache, Palpitation, Wasting Diseases, Vital Exhaustion, Loss of Flesh, and Premature Decay. Specially valuable for Nursing Mothers and during the Critical Periods of Life.

Druggists and Dealers throughout Canada sell Dr. Cassell's Tablets. If not procurable in your city send to the sole agents, Harold F. Ritchie & Co., Ltd., 10, McCaul Street, Toronto; one tube 50 cents, six tubes for the price of five. War Tax Extra, 2 cents per tube.

INCREASE MILEAGE OF YOUR AUTOMOBILE TIRES

Automobile tires, like machines, should receive some attention and care before they reach the point of "laying down on the job." A little care in looking over a machine occasionally will prevent trouble, so will a close examination of the tires while they are still in good condition enable one to prevent much of the trouble to which tires are heir.

The proper use of the extra or "spare" tire, which every autiost should carry, will enable him to make such examinations and repairs at the proper time. tA regular intervals the extra tire should be used to replace one of the service tires, and the one removed should be gone over immediately. All cuts, cracks, and breaks should be sealed by vulcanizing and the weak places reinforced. According to "Motor," if a car is in constant service, one tire exchange per week and in rotation will enable one to keep all the tires in as good condition as possible. Of course, this period depends upon the driver and condition of the roads traveled. By this arrangement, the extra tire will be kept in good repair for emergency calls, with the emergencies reduced to a minimum, and in most cases the tire mileage will be almost doubled.

THE GOOD DAIRY COW

"What are the signs of a good dairy cow?" is a question which has been asked for years. Certain signs are agreed upon by all, but hitherto a deeply rounded bottom line has not been considered essential. Professor Haecker, who has done a great deal of investigation in this line, however, puts great value upon it. He says: Suppose we take two cows similarly built as to angularity, except that one shows great depth through the middle, and the other lacking depth; both being about the same size will require an equal amount of food for support, say 8 lb. of digestible nutritive matter. The deep cow will eat and digest 16 lb. of digestible nutrients, using 8 lb. for herself as food and support, and 8 lb. she will convert into dairy products; or, in other words, you have a half interest in all the food she eats. You are an equal partner in the business. The cow lacking depth through the middle will take about 12 lb. of digestible nutrients per day, using 8 lb. for herself as food and support, and this she converts into dairy products, in which case you have only a third interest in the food.

ALGAE IN WATERING TROUGHS

Considerable annoyance is frequently experienced with a green scum forming in watering troughs which are uncovered and exposed to bright sunshine. This growth is due to algae, a farm of lower plant life, and aside from a possible disagreeable flavor which may be imparted to the water, they are harmless. However, a watering trough in this condition is always unsightly, and far from inviting to the stock that must drink from it.

Algae growth can be prevented entirely by treating the water with copper sulphate, or blue stone, using 1½ grains to each 100 gallons of water. The copper sulphate should be dissolved in a small amount of water, and this solution added to the water in the trough.

MEASURING HAY IN THE STACK

To measure hay in the stack, find the distance over the stack, its width and its length. Subtract the width from the over and divide the result by two. This will give the average height of the stack. Multiply this average height by the width of the stack and this product again by the length of the stack, and the final product will give the number of cubic feet of hay in the usual sized stack.

In order to get the number of tons when the hay is stacked with a rounding top, divide the number of cubic feet by 422 if the hay has been stacked for 30 days or less; if stacked for 60 days or more, divide by 400. If the hay is stacked with sloping sides from base to peak, divide the number of cubic feet by 512, which will give the number of tons in the stack.

For Safety and Economy

A storm sweeps over the country. Your neighbour comes to you with a tale of woe, saying that the wind loosened his roof, and the rain did the rest—damaged stock, bills for roof repairs; wasted time.

While he is looking with envy on *your* sturdy Paroid roofs, remind him how little

NEPONSET
Paroid
ROOFING

costs more than cheap ready roofings, an object lesson in the economy of using only the standard weather-proof and fire-resisting roofing—Paroid, that has defied the elements for 18 years.

Look for the Paroid roll, and you will find one of the 2,000 Neponset dealers throughout Canada.

Paroid is made in 3 colors, Grey, Red and Green.

Nasal and Throat
CATARRH

Every fourth person you meet has catarrh. It begins with running at the nose, the result of catching cold. If neglected it soon becomes chronic. Then it passes to the throat, the stomach, the bowels. It causes asthma, deafness, huskiness, hoarseness; it sets up dyspepsia and bowel troubles—there is no end to the dangers of catarrh.

Veno's won the Grand Prix and Gold Medal, International Health Exhibition, Paris, 1910.

You can cure a cold in the head in one night with Veno's Lightning Cough Cure; you can cure catarrh with it. For old-standing chronic catarrh use Veno's Nasal Tablets along with Veno's Lightning Cough Cure. These two in combination work miracles. Thousands have proved it. This British remedy has the largest sale in the world because it is the surest remedy in the world for—

HINTS ON GARDENING

There is no reason why any one with a little energy, a little time, a few seeds, and a love for the beautiful should not have a successful garden both for flowers and vegetables. The whole process is so creative and interesting. It seems stranges—does it not—that the little seeds, some almost as fine as dust, can produce such juicy vegetables, bright flowers, and sturdy bushes three or four feet high.

It is not drudgery to put in a garden—a little garden, I mean. It is all joy to the one who loves flowers.

To have a successful garden it is essential first of all to have good seed. After that the quality of the soil is most important; the very best is deep, rich, mellow, easily worked, and well grained. If it is too stiff, add sand and plenty of well-decayed manure. Fresh manure should never be put on a garden in spring. It is almost sure to burn the tender seedlings and roots, and do more harm than good. When the garden is under way it should be cultivated frequently. There are pointed hoes and hand rakes that help to make this work easier.

Your garden will receive a fine start if you sew a few seeds in flats (shallow boxes filled with garden soil) in the house, early in April. When it is time to set them out they should be sturdy and ready to grow right off. To have them so, they must be kept in a sunny window. They must be thinned out enough, and not kept too hot, or they will grow spindly. Never let the wind blow on them, but secure indirect ventilation. There is no better place for them than in the kitchen. The steam is good for plants. Plants that may be started in this way for the garden are tomatoes, lettuce, cabbage, cauliflower, squash, etc., and for the flower garden asters, petunias, balsams, mignonette, phlox, nasturtium, etc. Sweet peas may be planted in the open as soon as all danger of freezing is over. Seeds for later vegetables may be sown in the open early in May.

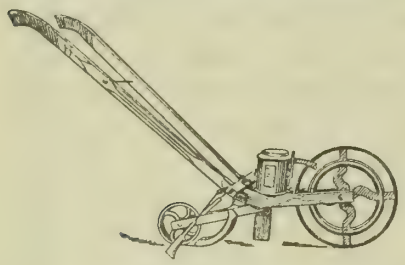
When setting out plants make a hole large enough so that the roots may be naturally extended in all directions, sift in the soil, firm down, water thoroughly, and cover the whole surface that has been moistened with dry soil to keep in the moisture. Setting out plants should be done in the evening, or on a damp, cloudy day. Should the sun be too hot, cover with shingles or other protection for a day or two.

Many people who do not care to give the labor to annuals, secure flowers about their homes by planting flowering trees and shrubs such as honeysuckle, eatalpa, lilac, wild cherry, hydranga, etc. Trees may be set out any time after the frost leaves the ground till the swelling of the leaves.

When setting out trees, remember that the under soil is usually deficient in plant food. In this case make the hole much larger than necessary, and fill with good fine garden loam. Do not cramp the roots. Spread them out well and water thoroughly before filling in the last of the soil. Keep a mulch of leaves or straw on the top of the ground, especially during the first of the season, to conserve the moisture.

For those who have no space for a flower garden, window boxes are often used to make the home beautiful and attractive. These boxes are made to fit the window, painted green, or any color to harmonize with the color of the house. Holes are bored in the bottom for drainage, and a layer of broken crockery or stones covered with fibre put in before putting in the soil. Planted with red geraniums, tuberous begonias, petunias, nasturtium, sweet alyssium, or lobelia, they look very attractive. Perhaps you may not all have time to plant vegetables and a variety of flowers, but you can at least plant a few nasturtiums in the back yard or in window boxes; give them plenty of water. They will gladden the heart and keep your homes supplied with flowers all through the summer.—Written by Mrs. Frank Shortill, of St. Marys, N. B., and read at the April meeting of the St. Marys and Gibson Women's Institute.

Garden Seeders!



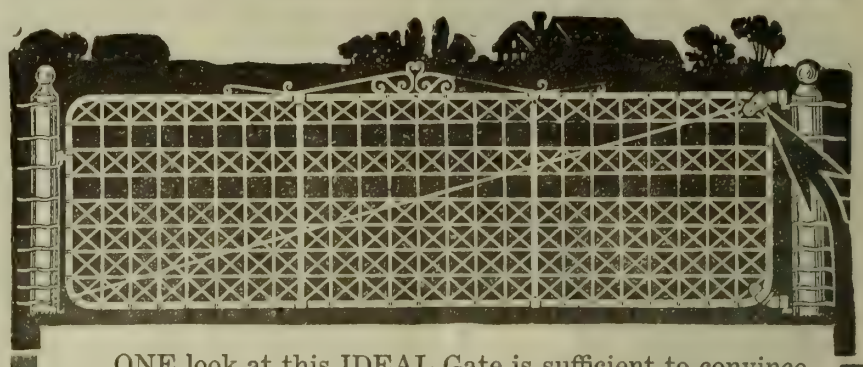
A DANDY FOR TURNIPS

Makes the drill, sows, covers and rolls the seed while you walk. Does the work of two men in half the time. No better seeder built for the accurate sowing of turnip, carrot, cabbage, beet, pea, corn and all other kinds of garden seeds.

Price $7.50 Delivered at Your Station. Order To-day.

The Sussex Mfg. Co., Limited,
Sussex, N. B.

The Improved "Ideal" Farm and Stock Gates



ONE look at this IDEAL Gate is sufficient to convince anyone of the superiority of IDEAL Gates over any other make.

Improved IDEAL Gates are without exception the best and most complete gates, combining as it were all the most modern improvements with proficiency.

IMPROVED "IDEAL" Gates do not cost more than any ordinary common Gate.

Note the **Position** of the **hinge clips** at the **corner bends** instead of on the back of the gate. This improvement provides the greatest resistance ever required and ensures perfect control—especially on long gates—and it also prevents the back part of the gate from breaking or bending.

THE IMPROVED "IDEAL" FARM AND STOCK GATES EQUIPPED WITH A BRACE TIGHTENER ATTACHED TO THE TOP HINGE CLIP.

Notice how the end of the brace wire is inserted in a hole in the ratchet wheel of the brace tightener (see illustration), enabling you to tighten or replace the brace wire in less than two minutes with a wrench, when you have practically a new gate without any extra cost.

In all Ideal Gates, we still maintain the same high quality of material, workmanship and finish that has made Ideal Gates so popular.

Remember that the Improved IDEAL Farm and Stock Gates have features that no other gates sold in Canada possess.

They are worth twice the price of an ordinary gate but WILL NOT COST YOU ANY MORE, IF AS MUCH.

Ask for Complete Catalogue 66, which will be mailed to you immediately.

LIMITED
P.O. Box 1842 MONTREAL, Que.

MARKET DISTINCTION IN EGGS

The claim that brown eggs will command a substantial price over white eggs in several of the leading eastern city markets and that elsewhere white eggs will command a premium must not be taken too literally. In the broad sense this statement is true, but it must be qualified. The Boston trade, for instance, has the reputation of calling for brown eggs, and extra-browns sell at a premium over other grades. On the other hand, New York City will pay a premium for extra-whites. Why this difference? Trade folks claim it a matter of custom. If so, the demand for the color must have originally come from the consumer.

Egg commission houses in New York claim that the call for white or brown eggs comes from the retail buyers, who probably follow their own inclinations to a certain extent. These comments refer to the general rade, and the call for brown and white eggs in this channel is probably about equally divided. The secret of New York City as a white egg market lies in the fact that the immense, although proportionately small, Jewish population, through religious and other requirements, demands a white egg. The hotel trade in New York is also large, and the better hotels must serve white shelled eggs because they look nicer. These conditions in a city like Boston are not so strongly accentuated.

It is noticeably a fact that the special call for white eggs in New York is largely for new laid eggs of fancy quality. These are received in quantity, but the demand is strong enough to offer a little higher price than for brown eggs. This is an everyday occurrence and nothing new or unusual. However, above the fancy grades may be new-laid eggs of extra quality. The supply of these is, of course, limited, and while the call is also limited, it is great enough to take up all extras at a premium. In fact, there are some buyers on the New York City market who do nothing but buy and sell these eggs of top-notch quality.

The natural query is: How much in advance of the general market do the extra quality eggs command? Seldom more than 1½ cents a dozen. In November, 1915, the extreme figure of 63 cents a dozen was reached in New York City for these extra quality, new laid eggs. All grades of white eggs were high for the season of this year; so high, in fact, as to be prohibitive to some buyers, who were forced to buy brown eggs. This exceptional condition was of small scope and of short duration. In sending eggs of extra quality and freshness to the New York trade, a producer can never know what price they will bring.—N. E. Homestead.

SEPARATOR COMPANY CHANGED HANDS

It will no doubt be of interest to our readers to know that the Raymond Manufacturing Company, Limited, of Guelph, Ontario, who for the past 16 years have been manufacturing the "National" Cream Separator, have recently sold this end of their business to the Ontario Machine Company, Limited, with head office at 18 Bloor Street East, Toronto, under the direction of Canadian separator experts.

Although the National separator will no longer be manufactured by the new company, a full supply of repair parts for the various types of the National machines will be carried in Toronto.

RECRUIT

THE FORCES OF YOUR SOIL

Commercial Humus

makes every inch of ground yield crops to the limit of its possibilities.

Commercial Humus is the ideal, safe and sound Soil Builder. It makes worn-out soil rich and makes rich soil richer. It is odorless and germless and accomplishes big results.

Carload lots in bulk or bags. Prices and literature upon request.

Ten 100 lb. Bags for $5.00

COMMERCIAL HUMUS CO.
H. F. MacClelland, Agent
Room 522
47 W. 42d St. New York

The Ontario Machine Company, Limited, will devote its entire time to the manufacture and sale of the new model Superior Separator. This machine is made with a self-balancing disc bowl, ball-and-socket spindle, and direct-to-the-bearing oiling device, and other features which combine to make the Superior a very popular and efficient machine.

Mr. L. J. Ball, who is well known to Canadian dairymen through his connection first with the Sharples Company and later with the Empire Separator Company, as assistant manager for Canada, will have charge of the sales department for the Superior separator.

The Ontario Machine Company, Limited, are very anxious to have the name of any of our readers who are owners of a National separator, so that they will be able to send them new price lists of parts, etc., from time to time, and our editor would appreciate it if the owners would write the Ontario Machine Company today.

YELLOW MILK AND BUTTER

The rich yellow color demanded by the Sydney and suburban public in dairy products is due to the character of the cow's feed. Though to a slight extent a breed characteristic, the intensity of the yellow may, within certain limits, be increased or diminished at will by changing her rations. The yellow color in milk consists of several pigments found in green plants. The principal pigment is carrotin, so called because it constitutes a large portion of the coloring matter of carrots. The other yellow pigments in milk are known as xanthophylls. These are found in a number of plants, including grass, but are specially abundant in yellow autumn leaves. These pigments pass directly from the feed into the milk. This explains the fact that fresh green grass and carrots increase the yellowness of butter, the only standard by which the average housewife judges its richness. This subject is not one of fanciful theory, but intimately concerns the pocket of dairymen. The housewife promptly complains to her grocer of deficient richness in the color of butter; the grocer passes the complaint on to his agent in Sussex Street, and this consignee pulls up the factory with a round turn. No time is lost in acquainting the dairyman that there is something wrong with the rations fed to his milking cows. Such complaints were rife during the recent dry spell on the North and South Coasts, and along the northern rivers.

On the other hand, a larger proportion of these pigments is deposited in the body, fat, and elsewhere in the cow. When the ration is changed to one that is poorer in coloring constituents, this hoarded store is gradually drawn upon, and in consequence the yellowness of the milk does not decrease so rapidly as it otherwise would. Yet the yellowness increases immediately the essential plant pigments are restored to the ration. Often the first milkings after the change will show a satisfactory improvement in color. Green grass is richer in carrotin than in any other dairy food. Cows fed generously on green grass will, therefore, produce the highest colored butter. Hence it is easy to see why complaints were rife in Sussex Street when the coastal grasses (native and English) were parched and colorless, and hand feeding with bought lines were general on a big scale. Bleached clover hay is practically bare of yellow pigments, as the resultant milk will show. Certainly the breed does influence the color of the milk fat, but varying the ration will produce a variion, more or less, in the color of the milk fat in every breed. Green corn, in which xanthophyll constitutes the chief pigment, will also produce a highly colored butter. Study of color, naturally imported to the butter by a cow's rations, is necessary for the dairyman who has first-grade prices in view.

WAYS YOUR EXPERIMENT STATION MAY HELP YOU

Are you taking advantage of the experiment station in your province? If not, you are losing valuable information which is compiled for your benefit.

Practical farm work is being done continually at the various experiment stations of the country, and the results are recorded, and bulletins on these experiments are to be had free.

Even the oldest farmer is certain to encounter some puzzling problems, and by writing to the experiment station those in charge of the work are only too willing to give out any information that is wanted.

A trip to the experiment station will be well worth your while, as you will have a chance to see the vast and valuable work carried on there and come to realize what can be accomplished.

Not only crop raising is carried on, but experiments in feeding live stock are being made from time to time, and the results of these experiments may be interesting.

The successful farmer is willing to learn, and he can find no better place than the agricultural college to get the desired information.

Farming is a business which has advanced by leaps and bounds in the last decade, and much of this improvement is due to the good work accomplished at the experiment stations.

There modern methods are tried out, and when they are profitable the farmer is informed. Many old farming ideas have been proven to be of little value by the work carried on at the experiment station.

Canada spends money annually to further the interests of the farmer, and it is up to him to take advantage of the work carried on for his benefit.

GETTING RID OF RATS

Rats are becoming a plague in some parts of the country, and all sorts of things are being tried to get rid of them. J. R. H. sends the following suggestion to the "Pall Mayy Gazette": Let me give you an infallible method for gathering in all the rats for miles around. Get a large tub, fill it about three parts full of water. Stand a brick on its end in the middle of the tub. Get some brown paper as a bridge stretching from the rim of the tub to the brick, all round the tub, so as not to let the water be seen. Then put a slab or board up against the tub for the rats to run up. Put a piece of meat as a bait on the top of the brick, and saturate it with oil of rhodium. The rats will come from all quarters at the very smell of it. The first rat that runs up the bridge tries to get at the bait, and falls through the brown paper into the water. He then climbs on to the top of the brick and starts to squeal. All the other rats for miles around come rushing to the aid of their distressed comrade, and each one topples into the water and is drowned. Only one can occupy the top of the brick at a time.

CULTIVATION AND CARE OF CORN

Attention Early, Late, and Often Necessary for Successful Yield

Corn is one of the greatest of the fodder crops of this country. It can and should be grown more extensively on Canadian farms. If it is planted on a warm, well-drained soil, a suitabel variety chosen, and its habits and preferences catered to, it will give a good yield even in a district where the growing season is short No agricultural plant will more readily respond to generous treatment in the way of thorough cultivation and care. The land should be worked well and a good seed bed prepared before planting, as no amount of cultivation after the corn is planted can make up for the poorly prepared field.

Successful growers begin to cultivate after planting, before the corn is up. Countless weeds will have germinated before the corn, and unless these are destroyed while small they will cause serious trouble. For this purpose the weeder is a splendid implement to use before the corn is up and until it is seven or eight inches high. If a weeder is not available, a light drag harrow may be used and will do effective work. Of course, a small amount of corn will be destroyed, but the loss of the extra seed which should be sown to permit harrowing is more than compensated for in the fewer weeds, in the conserved moisture, and in aeration of the soil. The regular corn cultivator should be started just as soon as the rows are visible. The first cultivations should be deep and wide, and as the corn develops the cultivations should be more shallow.

Too many farmers stop cultivating too early, which is a great mistake. When the corn becomes too tall for the two-row cultivator, the one-horse cultivator may be used.

Corn requires an immense amount of water at all stages of its growth, and just when it is making its heaviest demands upon the soil many farmers stop cultivating, with the result that when rain comes it packs the soil, and if the ground is heavy it will bake and crack. After the corn has received its early thorough working, cultivate shallow, often and late, is a motto that every farmer can safely follow.—F. C. N.

COLOR OF SULPHATE OF AMMONIA

Farmers are sometimes rendered suspicious about the quality of a parcel of sulphate of ammonia, when its appearance does not coincide with previous experience in this respect. It may, therefore, be mentioned that the shade of color is no guide to quality. The tint depends upon a detail in the process of manufacture—and farmers need not trouble about that point.

The nitrogen contents is the real thing, and the guarantee should be at least 19.75 per cent of nitrogen. It is very seldom that the quality of sulphate of ammonia falls below this percentage, and we are pleased to say that adulteration is quite exceptional. It is a safe manure for a farmer to buy.

WHY KEEP SHEEP?

1. Sheep will eat almost all weeds. It is claimed that of the 600 weeds growing in the northwest sheep will eat 576 of them.
2. Sheep will live on short pasture.
3. Sheep are capable of utilizing a large amount of roughage to grain consumed.
4. The cost of production is cheaper than cattle.
5. Sheep are adapted to intensive methods of farming.
6. Sheep bring in a revenue from wool, the lamb, and the old ewe.
7. Some places are only fitted for the raising of sheep.

JERSEY BULLS FOR SALE

Three young Bulls from R. O. P. cows with splendid records. These are just the type of Bull required by creamery patrons who wish to improve the producing qualities of his herd both in quantity and quality of milk and our price puts them within the reach of the man of moderate means.

W. CLARK & SONS,
Maple Grove Farm, North Wiltshire, P. E. I.

HOW TO DESTROY RATS

This is the way to conquer these costly pests, as told by Mr. Chas. E. Patton, the Pennsylvania Secretary of Agriculture, and Prof. Surface, Economic Zoologist: Destroy old buildings which give protection to such pests, and which themselves are unsightly, and will be better destroyed that left standing. Pile wood on supports, so that rats and mice may not find concealment, and dogs and cats can get under to find the pests. Close holes in buildings and walls. Make a mixture of cement and sand, with a little pounded glass, and put it into the holes through which rats and mice would otherwise pass. Make special efforts to render cribs, granaries, and mows proof against rats and mice. This can be done by the use of galvanized wire netting, tin, zinc, etc. Use poisons such as barium carbonate, and even the arsenates, mixed with food for the rodents. Use caustic, such as powdered caustic soda or caustic potash, scattered where rats and mice run. This burns their feet and drives them away. Make use of ferrets in driving them out. Preserve the natural enemies of rodents, among which are owls, hawks, weasels, etc. Make use of cats, and train them to be barn cats rather than house cats. Feed them so that they will not starve and run wild and kill birds, but do not feed them so much that they will not hunt rodents. Since the rodents run mostly at night, better results in this line are obtained by not feeding the cats too much in the evening. Keep terriers, and train them in destroying rats and mice. With but little effort they can be taught their duty, and will be busy during the day, while the cats are busy at night.

CUT YOUR PIGS YOUNG

Such is the advice contained in the bulletin on Pork Production of the University of Wisconsin: "The fact that hogs may be castrated at any age with little risk is the reason offered by many farmers for not performing the operation when the pigs are suckling. However, the loss due to putting off the operation too long is greater than is commonly supposed. The older the animal the more difficult it is to handle, and the greater the loss of blood and vitality. When the operation is deferred until weaning time, or later, the pigs lie around in a stiffened condition, lose their appetites, shrink in live weight, and it often takes two weeks before they are all back again in normal condition and ready to make profitable gains. On the other hand, the pig that is castrated when from four to six weeks old loses but little blood, and continues to nurse, scarcely noticing the operation."

R. O.M. and R. O. P. Holsteins

Would you like to get a good foundation? Holsteins of this calibre are seldom offered at any price, but we are overstocked and will offer::—

2 Daughters of "Ruby Nig" whose 7 day record is 567 lbs. milk, 25.60 lbs. butter; yearly record, 16,555 lbs. milk, 750 lbs. butter; the second highest record in Canada at 3 years of age.

2 Daughters of "Black Rose Beauty" whose record is 522 lbs. milk, 24.60 lbs butter in 7 days.

2 Daughters of Miss Rooker Posch, whose record is 402 lbs. milk, 16.114 lbs. butter in 7 days; 12,268 lbs. milk, 600 lbs. butter in one year, when 3 years old.

2 Daughters of Beauty Rooker, whose record at 2 years of age is 322 lbs. milk, 15½ lbs. butter in 7 days; 11,248 lbs. milk, 517 lbs. butter in one year.

And several others of equal breeding, sired by or bred to "Ida Rooker 2nds Vale," a sperior animal in every way and a proven producer of rich milkers. Also some extra nice bulls of the above breeding, all at reasonable prices.

LEA & CLARK, Victoria, P. E. I

ELMHURST SHORTHORN STOCK FARM

Present Offerings—Six exceptionally good red and roan bulls, 10 to 18 months of age, from superior milking dams. Write me for prices and particulars before placing your orders elsewhere

Bluebell View Holsteins are from the best stock to be had, being very closely related to two of the Toronto Champions. We shall have some Calves for Sale very soon, so write us for prices and don't forget we guarantee everything to be as represented.

WALTER PAYNE,
Bluebell ViewFarm, Lake Edward, N. B.

Maple Green Farm Holsteins

To avoid inbreeding, we now offer for sale our senior herd bull "Maple Grove Mercena Mercedes," coming 5 years old; weight about 2500 lbs., active, sure and exceptionally kind. His first daughter to be officially tested made 15.46 lbs. butter in 7 days at 1 year and 11 mos.; another at 2 years and 2 mos. was making nearly 3 lbs butter per day when she met with an accident and we had to drop testing her. His dam gave 12664 lbs. milk and 568 lbs. butter at 2 yrs. old in the R.O.P., and her sister Posch Mercedes Springbank 2nd, is the Canadian Champion 4 yr. old in the R.O.P. with 22000 lbs. milk and over 800 lbs. butter in the year. We are also offering Bull and Heifer Calves sired by him and "King Lyons Colantha" and out of high-class Record of Merit and Record of Performance Dams.

For further particulars write

What Standardization Means to Motor Car Buyers

IT means VALUE. Just to the extent that a car is standardized does the buyer's dollar approach the maximum of purchasing power.

Standardization means definite, proved quality, known manufacturing costs and reduced selling costs.

Of the million autos that will be sold in 1916, 75% will be standardized cars selling for less than $1000.00 each. This remarkable American achievement is the direct result of standardization.

Finally the upholstery has been standardized by the almost universal adoption of

DU PONT FABRIKOID
REG U S PAT OFF

MOTOR QUALITY

40% of all 1915 cars sold were upholstered in this proved, guaranteed material and in 1916 the total will be at least 60%.

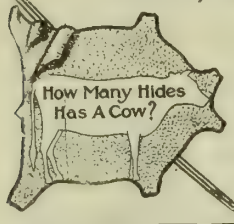
Fabrikoid is the only standardized automobile upholstery. It wears better than coated splits (commonly sold as "genuine leather") and has the artistic appearance and luxurious comfort of the best leather.

Rayntite Fabrikoid for tops, single or double texture, is guaranteed one year against leaking, but made to last the life of the car.

To get the most for your money, buy a standardized car

Du Pont Fabrikoid Co.

Toronto, Ontario.



Craftsmen Fabrikoid, the artistic upholstery material for furniture and home decoration is sold by leading department stores.

SUGGESTIONS FOR IMPROVING DAIRY COWS

The country life movement as being carried on in Wisconsin by meetings, institutes, and printers' ink, is a move that should greatly aid in improving life on the farm, not only socially, but in every way. A lecture on the subject "Fundamental Interests in Country Life," delivered in the summer school of religion at Madison, Wis., recently by Mr. A. S. Alexander, of the Wisconsin Agricultural College, offers some practical suggestions of interest to dairymen. He said in part:

"It is alleged that more than 90 per cent. of the bulls in use in the dairy districts of Wisconsin are grades and scrubs. This lamentable state of affairs indicates plainly that the results of forty or more years of writing, talking, teaching, preaching, and persuading against the use of such undesirable males are unsatisfactory, and that some practical plan of actual improvement should now be introduced. Only by the general use of pure bred dairy bulls can dairy cows be graded up and improved in quantity and quality of milk production. The general use of such bulls, and employment of better methods of feeding and management, would in a comparatively short time increase the present yearly average butter production of the Wisconsin cow from 175 to 350 pounds or more. Two top crosses of pure dairy bred blood have produced a grade cow that yielded 630 pounds (10½ tubs) butter in one year. Some scrub cows produce only 90 pounds butter a year. The 175-pound cow barely pays for her board and care. The 90-pound butter cow is kept at an actual loss. Only profitable cows should be kept.

"Pure bred bulls would be used were they everywhere available. They are not available now. They should be made available. This could be accomplished by the use of creamery company capital. It would be a legitimate and profitable investment.

"The parties vitally interested in this matter are the producer of milk and the buyer of milk. If the producer had better cows, sired by pure bred dairy bulls, he would make more and better milk at a greater profit. This would mean more and better supplies and better profits for the owners of creameries, cheese factories, condensing factories, skimming stations, and milk distributing stations.

"The creamery and factory owners should buy pure bred bulls and maintain them where they can readily be used by their patrons. The service fees, calculated at cost, could be deducted from the patrons' creamery checks. The danger of disease being spread by the bulls would be slight and easily prevented by sanitary precautions. All male calves produced should be 'vealed.' All heifers should again be mated with pure bred sires. Continuous grading up should be done and no cross breeding practiced.

"Such introduction of pure bred bulls would quickly eliminate grade and scrub bulls, set the right example, encourage the owners of dairy herds to own and use pure bred bulls, and in time lead to the ownership of pure bred dairy cows by the creamery companies. Wisconsin needs and should have put into practical use every pure bred dairy bull produced in her domain. Hundreds of such bulls are now sold out of the state each year. The plan proposed would lead to the home use of all of the bulls we produce.

"Let us stop merely advising the cow owner to use a pure bred bull; place a pure bred bull where he can use it, and then get him to use it. If this is done improvements will be sure, rapid, and profitable."

THERE IS MONEY IN IT

Today the prudent farmer hardly dreams of planting seed grain without testing it. He realizes there is on deposit in the Bank of Nature a huge sum of money, much of which may be his if elementary rules are followed in seeding and cultivating.

The average dairyman with twenty cows may reasonably expect as his share of nature's hoard a yearly income of two thousand dollars if the resultant crops are marketed through suitable cows. But can the unselected, untested cow be expected to take a prominent part in that annual distribution of nature's wealth? She may be fed and cared for to the best of her owner's ability, but there seems to be a loose end if he does not turn round and test her, determine her ability to turn the vast deposits in nature's bank into a round nine thousand pounds of milk, and leave a clear profit if milk fetches one-twenty per hundred.

Just guessing at seed vitality and power to grow is queer work; guessing at a cow's production and profit is risky and unnecessary. It is very risky because many a dairyman is deceived without the use of scales and test, and unnecessary because the dairy division at Ottawa supplies, free of charge, milk record forms. Write for them, either the three-day per month or the daily kind, with a herd record book. Their use gives certainty. Test your cows. There is money in it.—C. F. W.

Volume 21. SUSSEX, NEW BRUNSWICK, JUNE 6, 1916. Number 17.

ARTIFICIAL FARM DRAINAGE

By W. W. Hubbard

Supt. Dominion Experimental Farm, Fredericton, N. B.

No arable crop will give profitable yield in New Brunswick unless the soil in which it grows has air and warmth as well as moisture.

We have an average precipitation on our land during each twelve months of almost four feet of water. This large quantity of water goes off our land either by passage over the soil in the lower levels, through the soil to subterranean water tables, or it evaporates. Sometimes it does not get away naturally, but submerges or saturates areas of land for lack of natural means of escape.

Fortunately for us, our province is so well supplied with natural drainage by hills, brooks, and rivers that we do not, except in a very few localities, need large and expensive drainage canals as an outlet for any farm drainage we require.

Much of our land also in parts is fairly well drained naturally, but on the other hand nearly every farm has areas where heat and air, in the early part of the season at least, cannot do their work in facilitating plant growth because the soil is so full of water the air cannot get into it and the water makes it too soft to cultivate.

Were our growing season two or three months longer than they are, some of this soil might dry by natural means sufficiently to give a good crop, but here where every day from the first of May on is so valuable for plant growth, this soil that does not dry early is usually unprofitable.

While for the above reasons it is most certainly unprofitable to attempt to crop wet land, it is not always good investment to drain it. Regard must be had to the proportion of the farm requiring drainage, to the markets, to transportation, to the amount of money invested in buildings and other improvements, and perhaps other considerations affecting the desirability of the farm as a home, as well as the probable cost of drainage, before any farmer can decide whether or not it will be profitable to drain. Where a farm is well situated the farmer already established on it and desirous of remaining there, and there are no great difficulties in getting an outlet, it will pay the farmer well to drain the limit of his means each year until his wet land is all made fit for crop growing. Well laid underdrains are permanent; nothing but an earthquake can destroy them, and they will work for the farmer every minute of every growing season indefinitely.

How shall we decide if land needs drainage? This cannot be accurately foretold without knowing the history of the land for at least one wet season. If land does not dry out sufficiently to work without puddling within a week after the frost comes out in the spring it needs draining. If the water stands on it over night it needs draining. If it bakes hard during dry weather it needs draining. If coarse and undesirable grasses, rushes, sorrel, and weeds of various kinds thrive better than clover and timothy it needs draining.

The excess of water may be taken off the surface and out of the soil by either open drains or underdrains, or sometimes by boring holes through an impervious subsoil to a porous strata beneath. Usually a combination of open drains and under drains are required. Boring through the subsoil sometimes is very cheap and effective in the cases of cuplike depressions, where the cost of giving the water a natural run would be very expensive.

In the case of some farms the drainage first required consists of an open drain or a covered drain here and there to dry wet areas that break in upon fields where the major part is naturally drained. Usually a man with ordinary intelligence can do the laying out of such drains without going seriously wrong, and can add greatly to the value of his farm by perhaps a small outlay for drainage.

On a large proportion of our farms, however, a survey of the farm should be made before any great expense is gone to by some man with practical experience of drainage and with the necessary instruments to run lines and levels, so that a system which can be developed to accomplish the best results for the least expenditure may be properly tarted. The possibility of having to deepen, change location, or otherwise go over work which may be satisfactory for a limited area, but which will not correlate with drainage that may be required on adjacent land, can thus be avoided.

There is, therefore, perhaps no greater service which the Department of Agriculture can do than to make it possible for farmers to secure the services of a competent drainage surveyor at a small cost. Such a man can ascertain the best points for outlets, show where open drains are necessary, and locate lines for an under drainage system that will work; give the sizes of tile required for the various lines, and then make a map from which the work may be laid out and pursued from time to time as opportunity offers.

I am informed by Hon. Mr. Murray that his department is prepared to continue and expand the work begun last season of sending qualified men to make drainage surveys for those farmers who file a request with him and give guarantees of what they propose to do, and that he will also keep the steam ditcher owned by his department steadily at work for those farmers who can arrange for its use.

The Cost of Drainage

It is impossible to give an accurate forecast of what a drainage system will cost per rod, or per acre, until a very thorough examination is made of the nature of the soil and subsoil and the depths to which it is required to go to get suitable grades and outlets, as well as how close together the drains must be to drain the land. In our generally rolling country, grades and outlets are not difficult, but there is a great deal of subsoil that is. On the Experimental Station land, for instance, outside of perhaps 20 acres, the 370 acres lying between the C. P. R. track and the St. John River has a tenacious clayey subsoil with many boulders in it that makes machine excavation very slow and hand work very laborious and expensive. In most parts, after the top 18 inches is removed, the pick must be used in every inch below, and boulders are encountered that require the use of considerable quantities of dynamite. Explosives add considerably to the cost in two ways. First, their own cost (from 13c. to 20c. per pound), and by causing much loss of time in that the ditchers must quit work and retire to a safe distance every time a charge is ready to be ignited. While a power ditcher can excavate to a depth of 30 inches for 30c. per rod, and sometimes, under very best conditions, for slightly less, and hand excavation can be made for 50c. per rod, under the conditions at the Experimental Station the cost has been $1.70 per rod.

Besides the cost of excavation, in the case of under drains, he cost of the tile, the stone, or the wooden pipe have to be considered.

At the present time tile are much higher than they might be in New Brunswick. At the Experimental Station three-inch tile have cost us from $15 to $28 per thousand feet, and larger grades in proportion.

To give a general idea as to cost, the following figures may be taken.

With tile at the given price per thousand, soil that will enable a power machine to dig to a depth of 39 inches at 30c. per rod, and a horse device for filling in the ditch, the following will be the cost per rod:

	Tile at $15.	At $20.	At $28.
Tile	24.8c.	33c.	46.2c.
Excavation	30	30	30
Distributing and laying tile ...	4	4	4
Filling ditch ...	5	5	5
	63.8c.	72c.	85.2c.

Cost per acre of tile drainage with tile at different prices and with excavation costing from 30c. per rod to $1.70 per rod.

These figures seem large, and they are; but if the land to start with brings no returns, or very uncertain ones, drainage will practically eliminate the uncertainty and will give a crop where none grew before in the case of saturated land, in the case of wet and slowly drying land it will often double and quadruple the crop yields.

If $200 per acre is invested in draining, it means, if money is borrowed for the purpose, an annual interest charge of $12 per year, and with many crops this amount extra will easily be realized and a substantial margin left with which to reduce the amount of the loan.

Land under drained which gave only a half ton of almost worthless hay per acre I have seen yielding, by the aid of cultivation alone, from 2½ to 3 tons of the highest priced Timothy hay, worth this year from $13 to $18 per ton. At the Experimental Station we had a field of four and one-third acres so wet that it had never given anything but a light crop of hay. After draining it at the cost of $75.00 per acre, with the help of the power ditcher, we had the following season 340 barrels of potatoes from it without the application of $1.00 worth of manure. The potatoes yielded at the rate of 78½ barrels per acre, and sold for $86.35 per acre. Deducting cost of raising them, $38.00, it left $48.35 profit. This would pay the interest on the money invested of $4.50 and leave $43.85 to go against the cost of drainage, thus in one year reducing the indebtedness against the land to $31.15 per acre.

It is not absolutely necessary to use tile for under drainage. I know of a farm on which over two miles of stone under drains are laid, some of them down for over 50 years, and working perfectly yet. In some of these drains a pipe from 4 to 6 inches in diameter was made by laying stones on each side and covering with a flat stone; in others a cedar pole was laid in the middle of the ditch and flat stones laid up against it. In both cases the ditch was filled to within eighteen inches of the surface with small stone thrown in loosely and covered with either cedar bark or spruce boughs.

On other farms I know of under drains being made with three round poles, two on he sides and one on top, and these covered with small poles and spruce boughs. These drains were laid in 1875, and in 1908 were working as well as ever.

On the Experimental Station last year we drained an acre and a quarter with poles laid as above, and the system worked perfectly. The cost was, however, greater than tiles without paying any [illegible] for the poles.

In sections where lumber has been very cheap, three 2-inch planks in the form of a box without a bottom, and two planks in the form of an inverted "V" have been laid, and done good

(Contnued on page 580)

Vital Factors That Affect Farming Success

Thorough Tillage, Careful Seed Selection, and Better Management Essential to Large Profits

About three hundred years ago white men first began to practice agriculture on the continent of North America.

One hundred and fifty years ago most of the fertile valleys of Eastern America were occupied by farmers.

A little over one hundred years ago the first settlers came to Western Canada, but not until fifty years ago were all the best lands in the humid regions of the East taken up.

As late as 1850 there were practically no farmers in that immense area in the interior of this continent, extending from the Mississippi and Red Rivers on the east to the Rocky Mountains on the west.

This was all a vast plain, unpeopled and uncultivated, the home of the buffalo and the Indian. Our geographies characterized it as the "Great American Desert."

Yet within the memory of men now living this immense plain has been settled, and during the last forty years 1,500,000 people have come to establish homes in the Northern end of this so-called "desert" area. I refer to the provinces of Manitoba, Saskatchewan, and Alberta.

Some of the men have made fortunes; many have made a living; but some have failed to make either. We have faced, and are facing, difficult problems—problems of production, problems of transportation, problems of marketing, and with these we have undergone, and are still undergoing, the hardships of the pioneer.

I shall confine myself today to a discussion of three only of the problems that face us as farmers—the problem of Crop Production, the problem of Profit, and the problem of a Permanent Agriculture.

The Problem of Crop Production

The conditions that must be provided before crops can grow are known today. Nature supplies most of them with a lavish hand, but under some circumstances she provides one or more of them in but limited quantity. It is man's duty to find out the ones tht are supplied in smallest quantity—the ones that limit the yield, the ones that cause low productiveness—and then it becomes his business to make up the omission if it can be done at a profit.

In order to do this the crop grower must know two things:

(1) The factors that are essential to plant growth.

(2) The means at man's disposal for controlling or influencing them.

The Factors Essential to Plant Growth

The only things that are absolutely necessary before plants can grow are:

1. The seed—the life principle, the reproductive part.

2. Plant food—the chemical elements of soil, water, and air that are available to plants, and that are necessary for growth.

3. Water—a plant food itself, and also a carrier of plant food from the soil to the plant.

4. Heat—without which the life processes in plants cannot go on.

5. Light—for the synthesis or building up of organic elements of plant food.

6. Air—which not only supplies a large part of the food of plants, but which in small quantity in the soil provides a desirable environment for plant roots, and at the same time plays a large part in the development of "available" plant food.

Nature's Work and Man's

If Nature or man provides these things in available form and in suitable quantity the soil will produce abundantly.

Nature supplies plenty of air above ground and in all except humid climates or low-lying soils, or very heavy lands, sufficient in the soil as well. She also provides sufficient light, except where trees, or weeds, or other obstacles intercept the rays of the sun.

In northern climates nature sometimes fails to provide enough heat in spring and fall to mature crops, in which case man must either add to the supply or take such steps as will offset the danger from frost. This is one of the two chief difficulties facing the crop grower in Western Canada.

In humid regions the supply of moisture from the clouds is generally sufficient to produce large returns. In arid and semi-arid climates insufficient moisture falls every years to produce large crops every year, with the result that the supply of water must be increased artificially, as by irrigation, or steps must be taken to store one season's moisture in the soil for the use of the next season's crop, as by summer-fallowing.

From 250 to 1000 pounds of moisture is used up by the plant in the formation of one pound of dry matter in its tissues. In Western Canada we receive from 12 to 22 inches of water from the clouds annually. Some places receive twenty-five to fifty times that much. Our supply is small, the need is large. Man must furnish what Nature does not supply. Otherwise he must be content with low yields. The efficient utilization of our precipitation for the development of latent wealth that is in our soil is the biggest material problem Western Canada has to face. Water is generally the "limiting factor" in crop production here. In other words, it is the chief cause of low yields.

The supply of plant food in most soils of humid areas, and in some dry areas, is more or less limited. The result is that the maintenance of plant food is often the chief problem of those regions. In Western Canada our normal soils are rich. The total supply of the chemical elements essential to plant growth is relatively large. It would seem that our immediae problem is one of developing the resources of our soil, and that the maintenance of the plant food the soil contains should be secondary to profitable production.

The seed we sow may be good or poor. It is man's privilege to see that it will germinate vigorously, that it is free from disease and admixture, and that it is a sort that is suited to the climate and soil where it is to be planted. More than this is not necessary in good seed.

Man Co-operates With Nature

The means at man's disposal for controlling or influencing the factors that are essential to plant growth are:

1. The choice of suitable crops.
2. Suitable crop management practices.
3. The improvement of crops.
4. Irrigation or drainage, or both.
5. Tillage.

The Choice of Suitable Crops

The experience of men and the records of our experiment stations are available to teach us the crops that are suitable to our climate and soil. There is little excuse for using unsuitable crops today. Some doubt exists concerning the relative value of different varieties for some local climates and soil conditions, but even these are being quickly dispelled. One needs but refer to the nearest experiment station for the result of comparative tests. If these are not conclusive, cooperative trials on one's own farm should be. The value of many new and untried crops should be determined, and the suitability of different classes and types of crops for peculiar local soils or climatic conditions is a line of work that needs further investigation.

Suitable Crop Management Practices

The cleaning of the seed, its treatment for disease, the time, rate, and depth of planting, and the time and method of harvesting and curing are crop management practices that offer many opportunities for errors. Practice and science have, however, given us data that is a safe working guide to the successful prosecution of each of these and more specific information is fast accumuating. No one need long remain in the dark concerning the "crop management" practices now recognized as suitable to different portions of Western Canada.

The Improvement of Crops

We are improving our crops today by doing two things: (1) Preventing them from deteriorating. (2) By increasing their hereditary power, or improving their quality or other economic characters. The first is the business of the farmer; the responsibility for the second lies with our experiment stations.

Our crops deteriorate by admixture with weeds and other crops, by attacks of disease, by drought and frost, and by improper care of the seed. The prevention of this as far as is possible is necessary in order to maintain productiveness and quality. It is not always within man's power to do these things perfectly, but the better they are done the better the results will be.

We increase the hereditary power of our crops by selection and by crossing followed by selection. It is true that "like generally produces like," but it is not always so. Variations occur in all our crops. It is necessary, then, that the undesirable variants be eliminated, and the favorable ones isolated, tested out, and if better than the parent increased and made available to the crop grower. This is accomplished by the selection of individual plants, the production of the seed in a "pure culture," testing its hereditary power and constantcy by its yield and trueness of type, and then increasing as quickly as possible and make it available to the "trade."

"Crossing" is resorted to: (1) In order to produce variations so as to give greater opportunity for selection; (2) To engraft on a race some desirable character possessed by another. Crossing or breeding, the intermixture of the blood of two parents, results in many new recombinations of characters, some one of which may be the one desired by the breeder. This must be found, isolated, tested out, increased, and then distributed. Marquis and several other of our leading varieties were produced in this way.

Irrigation and Drainage

In dry climates moisture is the limiting factor in crop production. If water can be secured by artificial means a profitable agriculture may result.

In wet climates and low-lying soils moisture may also limit the yield, not because there is too little, but because there is too much in the soil. Under such conditions the removal of the surplus by artificial drainage is desirable.

We practice irrigation in parts of Western Canada. Over most of our country irrigation is not possible because water is not available. Drainage is not an important problem. Outside of a few local areas and on some low, flat lands, land drainage is not a serious problem with us.

Tillage

Tillage is the greatest means at man's disposal for controlling the conditions that at the present time are causing low yields on the farms of Western Canada. It is by far the largest single item on the cost side of the crop account. It is universally used the world over. Yet its practices are as fruitful of debate and as difficult to agree upon as the planks in the platform of a political party. Tillage is the most important subject connected with crop growing, and at the same time it is the one upon which we have the least data concerning the relative value of different practices.

In the dry year of 1914 the yields of Marquis wheat at Saskatoon ranged from six bushels per acre to thirty-two. In the wet year of 1915 they ranged from 17 to 47. The differences were due entirely to the different tillage practices followed.

Our observations have taught us that among other things tillage may be used:

1. To store moisture in the soil, as be deep plowing early in the rainy season.

2. To conserve moisure in the soil, as by the granular mulch on the surface resulting from surface cultivation.

3. To facilitate moisture in the soil, as by firming loose soils and loosening hard soils.

4. To modify soil temperature, as by lessening evaporation and by firming the soil over the seed.

5. To increase the earliness of a crop, as by packing, storing less moisture, and developing less available plant food.

6. To increase or decrease the air content, as by loosening hard soils and firming loose soils.

7. To develop available plant food, as by modifying the heat, moisture, and air content of the soil.

8. To kill native grasses and shrubs, e.g., plowing in a dry time.

9. To control weeds, as by surface cultivation, to expose the roots to sun and wind.

10. To control soil drifting, as by the practice of shallow ridging and the use of the granular mulch.

11. To dispose of rubbish and cause its decay, as by plowing same under.

The Problem of Profit

It is not enough that we should know the factors that are essential to plant growth and the means of controlling them. The intelligent farmer does not farm for his health alone. For him there must be some profit after the cost of production has been met.

It is not difficult to grow crops. It is not very difficult to grow 40 bushels per acre every year. But it is a difficult matter to grow crops at a profit, even 40 bushel ones.

Factors Affecting Profit

Suitable crops planted in productive soil according to up-to-date methods may not yield profitable returns. In order that crops be produced profitably not only must the conditions of growth before mentioned be provided, but the crop must be protected from:

1. Weeds, which rob it of its plant food and moisture and increase the cost of production.

2. Insect, animal, and bird pests, which lessen the yield or quality either before or after maturity of the crop.

3. Plant diseases, which nourish themselves on the tissues of plants

and thus lessen their yield or quality, or both.

4. Severe winds, which injure the soil and damage the crop by "drifting," or by stunting, lodging, or shattering the grain.

5. And the bushel cost of production must be lowered or the price increased.

Means of Controlling the Factors that Lower Profit

The most effective means of controlling the factors that lower profit are:

1. The practice of a crop rotation.
2. The use of live stock.
3. The application of business principles to the management of the whole farm—the land, the stock, the machinery and other equipment, the labor, and the finances.

Crop Rotation and Live Stock

The use of a suitable crop rotation is the most efficient method of combatting annual and biennial weeds. Live stock will aid in controlling many more. When crop rotation and live stock control weeds they do so at no cost to the farmer. They lower the cost of production. In fact, live stock changes an item of cost—viz., weeds—to an item of profit.

In our opinion, we shall control the present situation when we adapt our system of farming to meet the conditions that have caused and are now causing low yields and poor quality in our crops. That adaptation will include a rotation of crops which will aid in controlling weeds and drifting soil, in lessening the cost of production, and in building up a more permanent agriculture It will necessarily include live stock to make use of the forage crops that must be grown, and to lessen the amount and thereby the cost of the tillage necessary to control weeds.

It would seem that the rotation should include a grass or grass-legume crop to aid in the control of annual and biennial weeds and an intertilled crop to help fight the perennial weeds. What these crops are to be, and the sequence they will follow, you and your experiment stations must work out. Corn, alfalfa, western rye grass, timothy, winter rye, beardless barley, and possibly red clover, together with the cereals now commonly grown, seem at present to offer the greatest promise.

Such a change on all the farms in Manitoba will require an initial outlay of enormous capital for fencing, buildings, and stock. We shall have to make the greater part of this money ourselves. Our problem then will be solved but slowly. Nevertheless it will be solved. It is largely a rotation, a farm management, and an economic problem. The purely agronomic or crop and soil phases of it are at least difficult to answer.

Business Farming

Time was when the farmer did not need to be a business man. He produced his own food, he grew and manufactured his own clothing, and built his own house. He lived unto himself largely. He needed little business training.

The modern farmer must be a business man. He cannot live unto himself. Today he must spend. Therefore, he must have something to sell. Therefore, he must do business. It does not take long to learn the art of farming, but it takes some of us a life time to learn the art of successful farm business. We must lower the cost of production or we must get a better price. The former is our privilege; the latter may or may not be.

What we as individuals need today is to give more attention to mathematics in relation to our business and less to faith in salesmen and hope in the weather and the "greater production" theory. Our profits are determined by the difference between our receipts and our expenditures, and not by our gross income. What we as a class need today is greater co-operation, not only in marketing, but also in buying our goods. As a class we are slowly learning the lesson of co-operation. We admire the Grain Growers' Association and related co-operative enterprises. They have done splendid work in the interests of the farmer. Let us hope that this Association will always be actuated by fairness, but let us have our due reward.

The Problem of a Permanent Agriculture

We are hearing much today about the "depletion" of our soil, the loss of "fertility," and the "exhaustion" of plant food from our pland. From another quarter we hear about the wonderful productiveness of western soils —"the richest in the world," and about their "inexhaustible" supply of fertility.

One hears of a man whose soil, after continuous cropping and no return of plant food, is producing as much or more than it did a generation ago, and we are led to ask ourselves: "Where is truth? Do soils 'wear out'? Can they become 'depleted'? Are they being exhausted or not?"

These are questions the answers we make to which will have a very important bearing of the future development of Western Canada.

What is fertility? In its narrowest sense it is plant food in the soil the chemical elements plants use in growing. In its broadest sense it is ability to produce crops; it includes "available" plant food, and heat, and water, and air, and a suitable environment for seed and plant it means productiveness.

Soils do not become "depleted" or "exhausted" of the plant food elements they contain, but they may become depleted of their "productiveness."

Our normal soils contain enough nitrogen in the surface 6 2 3 inches of an acre to grow 50 bushel crops of wheat every year for 125 years, if all could be used and there were no losses except through the crops themselves. But plants cannot use more than two per cent of this nitrogen in any year. The balance is not available. After we grow 125 crops there will still be much nitrogen left, but with our present method there will be little productiveness left. Our soils do not become depleted of these elements, even the abandoned farms of the east contain considerable quantities of these, but our soils do become depleted of their productiveness, and that concerns us vitally.

We must not let the supply of total plant food get so low that the small percentage that becomes available to plants annually will be insufficient for a large crop.

Neither must we let other conditions, such as lack of moisture, weeds, drifting soil, and loss of organic matter, lower the "productiveness" of our soils.

A "poor" soil may be productive, a "rich" soil may be unproductive.

If a system of permanent agriculture is to be established on our western prairies, and the future of our state depends upon its establishment, we must not carry our wheat system too far. We cannot eat our cake and have it. We are selling our soil at the rate of 25 cents per bushel of wheat. We can afford to do that for some time, but we can't afford to do it indefinitely. On some soils we can't afford to do it at all. On others we can do it for a generation or more without serious injury.

If we had to replace the plant food in the surface 6 2-3 inches of an acre of our normal soils, it would cost us $1,250.00. In that volume of soil there is the equal of 5000 bushels of wheat. Men would get it all out at once and leave none for future generations, but Providence has wisely provided that only two per cent of certain elements, one per cent of others, and one-tenth of one per cent of still others can be annually released from the soil. We cannot deplete our soils of their wealth if we would, but we can and are depleting them of their productiveness.

In the final analysis, our ultimate success as a nation depends not only upon our ability to produce profitable crops now, but upon our ability to keep on producing profitable crops.

The most reliable information the world affords shows us that in England, land cropped continuously to wheat for over sixty years produced an average of 12 bushels per acre, when grown in a rotation of turnips, barley, clover, and wheat it produced 25.6 bushels per acre for the same length of time. The most reliable information that America affords shows us that in Illinois corn grown continuously for twenty-nine years produced 27 bushels per acre, while in a rotation of corn and oats it produced an average of 46 bushels. In a rotation of corn, oats, and clover 58 bushels; and when manured in the last rotation 81 bushels per acre; and when manured and fertilized with chemicals 96 bushels of shelled corn per acre.

The air over one acre of land contains seventy million pounds of nitrogen. This is sufficient to produce 50 bushel crops every year for a million years, yet farmers in some places are paying 15 cents a pound for nitrogen. Nitrogen in the air can be secured at no cost to the farmer if he will but grow some legume crop at intervals. These have the power of taking the nitrogen from the air through the medium of bacteria that live in nodules on their roots.

Tillage, the choice of suitable crops, and suitable cultural practices will enable us to develop the resources of our soil. Business methods and in some places a rotation of crops and the introduction of live stock will enable us to produce crops more profitably; but only the use of legume crops, the practice of a crop rotation, and the return to the soil of some of the plant food we removed in crops and fallowing will enable us to build up a permanent agriculture, without which the future of the state is not a pleasant thing to dwell upon.—Prof. J. Bracken, Saskatoon Agricultural College.

Reducing Foal Mortality to a Minimum

Judicious Feeding, Regular Exercise, and Sanitary Surroundings Necessary

Experienced horsemen tell us that the greatest mortality in foals occurs in a season following a severe winter in which brood mares have had but limited outdoor exercise. If this statement is true, the heavy snowfall of the past winter will have the effect of reducing the percentage of live foals this spring. In view of these circumstances the results of the foaling season of 1916 will be followed with interest by horse breeders generally.

The upward trend of horse prices during recent months will convince many breeders that the colt crop this year is worthy of some attention. That these prices cannot logically fall to the level of those prevailing in 1914 and 1915 is maintained by all authorities who have studied the effect of the war on the horse industry. A few remarks, therefore, on the care and attention necessary in saving the life of the foal would seem timely.

In the management of the pregnant or "in foal" mare, the essential consideration is to secure a state of health and condition conducive to the well being and profitable utilization of herself and offspring. Thus the mare must safely carry the foal throughout the required period of gestation until it is born, and the foal must then be safely preserved during the earlier periods of its new existence.

The average period of pregnancy in the mare is eleven months. Some mares normally exceed that period by two or three weeks. The foal that is born at a period of two or three weeks less than eleven months is, on its arrival, often weak and lacking in vitality.

Throughout the period of pregnancy there is ever present the possibility of influences intervening which may produce abortion. By abortion is meant the premature expulsion or delivery of the foal, and at a stage which it has not attained sufficient development to live external to its parent. It is generally admitted that with some mares there is apparently a special predisposition to premature delivery, and with them a very trifling cause may make them abort or cast the foal before the proper time.

It is important that in-foal mares be given regular, moderate exercise up to the time of foaling. This does not mean overheating, overdrawing, or overexertion of any kind. Regular work in the field is ideal exercise for the brood mare.

Some preparation is necessary to insure the safe arrival of the foal. This consists in placing the mare in a clean, roomy, well-bedded box stall. During partuition, and for a week fellowing, it is extremely important that the mare and foal be given perfectly sanitary surroundings. Mares should be closely watched for commencement of partuition. Although a mare may have given normal birth to several foals, this is no assurance that abnormal conditions will not arise. If all conditions are normal, only a few minutes will expire from the time the water sack makes its appearance until the foal arrives; consequently if there is any great delay assistance is required.

The first step is to make an examination, and relieve the cause of obstruction by placing the head and feet in a natural position for delivery. If hind feet are being presented first, assistance is required to see that foal is properly placed. This is accomplished by bringing out hind feet and lifting stifle of foal well over plevic bones of mare. This will turn the foal with its back upward, and delivery should be accomplished in time to save life of the foal.

Cases of Emergency

All foals are nourished while in the uterus by a process of absorption through the afterbirth, which covers the internal surface of the uterus. When contraction or pains of labor take place, it naturally follows that the afterbirth becomes detached, and the foal's supply of nourishment of both oxygen and blood supply is cut off. The foal must necessarily perish if not delivered in a short time. In ordinary cases, about thirty minutes

MAKE THE BEST OF EVERYTHING

If you cannot get the choicest seed, make the best of what you can get, and soon your crop will be better than ever.

You may not have the best cow in the world, still, if she is the best you can get, bring out the very best there is in her by good feed and care. She will help you to earn money to buy the better cow you want.

Money may be scarce; it often is in the spring of the year. Make every cent go just as far as you possibly can. That is the way to make two cents grow where there was only one before.

Make the best of the old plow, the old harrow, and the old mower, and keep your eye out for better ones, bought with the money these well-worn tools make for you.

But don't be satisfied with the things which are not the best of their kind. The best farming is done with the most up-to-date tools, the choicest seed, the finest cows.

In every situation, under every circumstance, make the best of present conditions and work steadily toward the very best. Nothing can beat the man who does that.

THE PSALMS OF A FARMER

Teaching Love of the Soil

* * *

Bert Morehouse

* * *

1. So long as my tongue liveth, I will declare my love of the soil;
   I will declare my delight unto my brethren;
   In the midst of the assembly will I speak of it.

2. Everywhere I will preach the gospel of the soil,
   That men may not forget their nativity.

3. Ye of the city, climb to your housetops in the cool of the evening,
   When the winds of the country, carrying the sweet scent of the soil upon the wings of the night, drift in from the arable fields,
   And let your souls taste the life of it.

4. And all ye backsliders, born of he soil,
   Ye who have turned your backs upon your priceless heritage,
   Why harden ye your hearts against returning to plenteous independence,
   Where each day bringeth forth a new vision,
   And each evening addeth a new peace?

5. O ye farmers, fathers of children, teach them to love the soil that gave them birth,
   By making their tasks interesting and stepping stones to visions of larger things agriculturally.

6. Provide for them home entertainment;
   Be companions of your children;
   For they must play as well as work.

7. Therefore teach them the joy of farming,
   And they will teach it to their children,
   And to their children's children.

A RISE IN OIL

D. A. McCombe, writing in a recent number of a New England exchange, relates the following incident, which conveys a moral re the care of machinery of all kinds which each and every reader should heed:

"A few days ago I found my neighbor in the shed back of his house in the act of paying an enormous price for the lack of a spoonful of oil.

"'What are you doing, Morg?' I asked, as I surveyed his automobile engine in pieces scattered all over the floor.

"'I burned her out,' he answered, looking bored. 'I ran her about ten miles yesterday without quite oil enough. I saw she was getting hot, but thought she would stand it home. When I got in, one of the piston bearings on the engine was dry and so hot that the babbitt was melted clean out.'

"Morgan is more fortunate than some of us. He is machinist enough to repair his auto. He first called up a garage, and they wanted $25 for the job. That he wouldn't stand, so I found him in overalls with sleeves rolled up and at it himself. Besides a day of hard, dirty work, and some money for babbit metal, he was out the use of his machine and time—and all for the lack of a few drops of oil to supply the urgent needs of his machine.

"He acknowledged that he had been not only thoughtless about the use of oil, but that he had been using a cheap grade, and then he added:

"'I've quit cheap oil, and from now on I am going to use the best and plenty of it.'

"It is well to keep in mind that what will work on the automobile will also apply to many other things on the farm. The best oil is always cheaper than machinery."

The road that leads to success is paved with stepping stones.

* * *

Weigh your words, and give such good measure that you won't have to use many of them.

* * *

No man is ever rich enough to be idle. Indolence is a greater sin among the rich than the poor.

* * *

Keep the garden busy by planting a second crop as soon as, or maybe before, the first crop is gathered. A plot of ground 25 x 75 feet in size will grow enough vegetables for a small family.

* * *

If a tool or implement is worth borrowing, it is worth taking home in just as good condition as it was when it was borrowed.

* * *

Breed and feed more and better stock. It will pay well so to do. Looked at from every angle, with due allowance for all possible contingencies, our judgment is that live stock will be profitable for 1916 and for years to come. Cattle, cows, sheep, hogs, horses all have fine prospects. Tie to good stock—you will never regret it.

* * *

Beware of flies, mosquitoes, all vermin. Keep them off yourself and your food. They are disease conveyors. Low ground fed by summer rains will breed mosquitoes by the billion. A little kerosene oil poured on such waters forms a film that prevents the young mosquitoes from getting out and kills them. A few cents' worth of oil thus used now may insure comfort to man and beast

* * *

We often wonder if farmers generally know what a store of useful information the advertisers in farm papers have on hand, ready to give out to those who ask? Send for some of the free literature on the subjects in which you are, or should be, interested. When you know something about a thing you are ready to decide whether you want to know more about it.

* * *

Nagging is a particularly bad habit—about the worst any one can have. It has started more people on the downward path than any other evil. It is at the root of more troubles than any other one cause that could be named. It does incalculable harm and never does any good. It debases the nagger and drives to desperation the nagged. Why, therefore, nag?

Features Gathered From the N. B. Women's Institute Reports

(Continued from last issue)

Hammond and Markhamville.—Since report of last year, this branch has grown in strength and purpose. Past year has been one of activity for every member, and as a result extensive repairs have been put on the Markhamville school buildings and Hammond public hall. Membership 26, average attendance 15. Programme of regular meeting generally consists of two papers and anything else that may come to hand. The method of choosing a committee to make out the programme for six months at a time has proven very successful. Sewing circle still continues, and many a lesson learned by seeing each other's handiwork. Another active member had the misfortune to lose her home and contents by fire, and the Institute remembered her with a donation. Patriotically, $10.25 was given to the Ambulance Fund, a well-filled box to the Belgians, and a few knitted articles to the soldiers. Funds have been raised by selling patriotic buttons, a Bean Supper, and a Concert and Pie Social. With permission from the Supervisor, this branch organized an Institute at Poodiac.

Havelock.—First started in 1912 and has steadily grown not only in members but in the sphere of its helpfulness to the community. Since the war it has enlarged the field of its endeavors to the outside world also. Printed programmes so satisfactory the old, haphazard method of preparing from month to month will never be adopted again. Four committees of three members each were selected to repare the programme, and each committee had a period of three months allotted to it. Programmes are well thought out and well balanced, consisting usually of roll call answered in various ways, Current Events, Question Box, a Discussion or a Debate or a Paper, and a demonstration which usually ends in the serving of a delicious lunch, when nourishment for body as well as mind is given. Two meetings a year are set aside as public meetings and this year they were of a patriotic nature, one taking the form of a recruiting meeting, when two young men enlisted. Much interest manifested in lighting the streets of the village, but so much money was needed for patriotic work it was thought advisable to purchase one light only, and this for a particularly dark corner. Money has been raised in the following ways: Collected for Hospital Ship Fund, $32.30; proceeds from two ice cream socials, $12.27; collection taken at public patriotic meetings, $71.92; Sock Social Tea, $11.00; sale of "Allied for Right" buttons, $10.00; sale of tags at local exhibition, $30.00. This gave a total of $261.49, which was expended as follows: Hospital Ship Fund, $32.30; cost of street lamp, $7.62; paid to Ambulance Fund, $9.00; paid to South Centre Rifle Club, Toronto, socks for soldiers, $10.00; materials to sew and knit, $99.06; bed in hospital in France, $80.92. At two different times large quantities of clothing were sent to the Belgians, and to date 48 pairs of socks knitted. Membership, 34.

Lower Millstream.—Organized in 1911. Membership grown from 12 to 40, with an average attendance of 23. Last year programmes printed in the form of a wall card, and one copy placed in each home in the community. Economizing this year and using the typewritten programme. Subjects for each meeting vary, as what would interest one would not interest another. Roll call answered with Patriotic, New Year's, and Christmas quotations, also "What we should remember," "Dont's," and "Conundrums." During the year $45.00 has been raised and $40.00 expended. The sum of $2.00 was spent on a Clam Supper, $9.00 for a Circulating Library, $11.00 to the Home Relief Fund, $5.00 to the Ambulance Fund, and $5.00 to a Red Cross Society. Not specializing in Red Cross work, as a Red Cross Society is in existence. Three boxes of clothing have been sent to the Belgians. Institute has been the means of developing latent talent. One woman freely admits that the Institute has made a new woman of her. Whereas four years ago she hardly thought it possible to write a paper, today she is considered one of the most capable women in the Institute. And as woman is a controlling element in each home, and the homes make up the country, any improvement in one means an improvement in the other, so we feel we are following our motto —"For Home and Country."

Newtown and Smith's Creek.—During the last year 12 meetings have been held, with an average attendance of 14 members. Membership 26. Members much interested in Red Cross work. The sum of $18.00 was collected for Hospital Ship Fund, $63.15 for Belgian Relief Fund, and $11.00 worth of clothing sent to the Belgians. In order to contribute to the Motor Ambulance Fund patriotic buttons were sold and $10.00 made. Some of the most helpful papers for programme work have been "Uses of Salt," "Life's Worries," "Lessons of Life from Weeds," "Economy in Dress," "The Care of Cup Towels," "Home Sewing," and "What are the Qualities to Insure Success at Any Business?"

Penobsquis.—Organized in August, 1914, with a membership of 12, which has since increased to 18. Average attendance of 18 members and usually two or three visitors. Adopted the plan of answering roll call with quotations. Memories very poor at first, but a fine of five cents imposed every time a member merely answered with a feeble "Yes" soon developed excellent memories. A committee was appointed to arrange a programme for the year, when one paper a month was allotted to different members, also a "discussion question" was down for each meeting. If a member failed to give a promised paper she was fined 25 cents. Some papers included "The True Spirit of Christmas," "Friendship and Sociability," "How to Make the Home Cheerful and Attractive," "Self Control," "Mother's Duty to Her Child," and "Girls' Home Duties." The discussion papers were "Preparation of Winter Vegetables," "Value of Women's Institutes," "Saving Steps," and "Current Events." Money has been raised in such ways as $31.25 collected for Hospital Ship Fund; $65.75 raised from a Pie and Basket Social to buy flour and beans for the Belgians; $18.65 realized from an apron and necktie sale and bean supper for purchasing material to be made up for the soldiers; $5.00 from the sale of "Allied for Right" buttons for the Motor Ambulance Fund. So far 76 articles, including socks and hospital supplies, have been sent to headquarters.

Sussex.—The year just closed has been one of steady growth and progress. The meetings have been well attended, programmes helpful, and since last convention membership has been doubled. The outstanding feature of the year's work has been patriotic efforts. At the August meeting, immediately after the outbreak of war, a committee was appointed to have charge of the patriotic work of the Institute, and their first work was to make a thorough canvas of the women of the community in behalf of the Hospital Ship Fund, the sum of $163.45 being collected. Next undertaking was "Button Day," when by sale of "Allied for Right" buttons $105 was forwarded to Miss Winter for the Ambulance Fund. A "Self-Denial Day" for suffering Belgium was a fitting climax for a good year's work $386.39 being realized. Thus through the year has passed through the hands of the committee $654.84. At the present time they are preparing for a Patriatic Fair. Taking as a nucleus the fancy work and canned goods exhibited by the Institute at Fredericton, they are asking for donations from all the people of the town and vicinity. They will charge a small admission fee, have a lunch counter, a candy booth, a table of cooked food for sale, and a miscellaneous assortment. Anything remaining at the close of the evening sale will be sold at auction. Already many practical demonstrations have been given in the Household Science room in the Dairy School, and others have been planned for the near future.

Blackville.—Since August, 1914, the meetings have been held in a room of the old school building which was secured for the purpose by paying a small rent. At the expense of the Institute, it was fitted up with tables, chairs, blinds, lamps, etc. A second-hand organ was bought. The building is situated in about the middle of the village and is admirably suited for Institute meetings, especially since taking up Red Cross work. Through the medium of an energetic Red Cross committee 1,062 articles, including Red Cross supplies and comforts for the soldiers, have been shipped to proper authorities. Also, a large box of second-hand clothing was sent to the Belgians. The Red Cross committee planned for fortnightly meetings during the winter months and weekly meetings during the summer months. These meetings have been very much enjoyed by all. While the older members knit and cut out garments the younger members wound yarn, made face cloths, mouth wipes, handkerchiefs, and tore and rolled bandages. The sum of $303.33 has been raised and collected during the past Institute year. Of this money, $60.00 was sent to the Hospital Ship Fund, $100.00 to the Belgian Relief Fund, $56.50 to the Ambulance Fund. The "Tag Dag" held in July was very successful, $69.66 having been raised. During the year addresses were given by Rev. L. Beaton on "The Cigarette Evil," by Rev. Mr. Dunlop on "Boys in the Home," and Rev. H. T. Montgomery on "The War."

Centre Napan.—Enrollment 49, with an average attendance of 20. Each member responds to roll call with a quotation. The printed programme scheme for the year 1915-16 has been successfully carried out. Edifying subjects have been discussed, debated upon, and many instructive papers read by the members. A few of the subjects to be taken up for study this winter are "Notable Women of Canada," "Value of Self Control," "Home Management," "Value of Cheerfulness," "Girls' Influence in the Community," "Books We Should Read." During the past winter an evening a week was devoted to Red Cross work. Each member was taxed five cents—our homes thrown open to all in the community who wished to attend and bring with them the minimum fee (five cents). In this way the sum of $24.21 was raised, with which material to make pillow slips and shirts, and to knit socks, scarfs, and mittens was purchased. Money amounting to $88.50 was raised for Belgian Relief and Red Cross work and through the sale of "Allied for Right" buttons $54.50 was given to the Ambulance Fund. The sum of $57.30 was expended on the Agricultural Hall, where the society meeting are held. The women of the community were instrumental in having this hall erected in 1912, and the above sum expended closes the debt. Receipts for the year amount to $225.34 and expenditure $205.04. As a body we feel that our Institute has done much for us in broadening thoughts, expanding our ideas, and giving us fuller intercourse with the intelligent and industrious people of our community.

Millerton.—Last convention membership was 22, now it is 35. Meetings are held at the homes of the members, but in the spring this branch hopes to secure the use of the schoolhouse, as many of the houses seem too small to accommodate the large number of members and visitors attending the meetings. During past months many entertaining and helpful subjects have been discussed. A trained nurse, with many years' experience, gave some splendid information on "Home Nursing." At another meeting the subject was in the form of a "Question Box." Each member was allowed to ask a question on any subject; thus the programme varied and at the same time was highly instructive. Over $200.00 has been raised for patriotic purposes, the bulk of it being used to purchase Red Cross materials and yarn. One of the methods by which money was raised was a drama; another an ice cream and cake social, and another by levying a small tax on the members. Altogether 432 articles have been shipped to the soldiers and hospitals. Members of the 28th Battery, while passing through Millerton to Valcartier, were presented with boxes of "eats" by this Institute. At roll call each member answers with a useful hint or quotation. An "Entertainment Committee" was appointed, and at each meeting 15 or 20 minutes are devoted to singing and instrumental music. Refreshments are also served.

Newcastle.—Organized June, 1915, with 8 members. Monthly meetings and several special meeings have been held, and the membership is now 30. This branch plans having a series of cooking lessons this winter, each member furnishing materials and utensils for one, and the department supplying the teacher. Members not doing patriotic work under the auspices of the Institute, as they all belong to the eRd Cross Society organized at Newcastle. The Women's Institute in Newcastle has become a permanent institution productive of much good.

THE WOMANLY WOMAN

Today there exists, as there always will exist, a woman who is striving to reach the highest pinnacle of success as a home maker She has never wavered from her true course of duty or swerved in life's purpose and plan. She is not a myth, this little womanly woman, but she is as actual and as real today as she ever was. She is the woman whom we are willing to trust with the welfare of the nation, for she has not run after false gods, or been lured by the siren voice of the outside world, but she has gone back to nature and has listened to the call of a man and the voices of little children, and she admits that there is nothing as satisfying or worth while, in the whole wide world, as the making the home and rearing of children.

HORTICULTURE.

FRUIT PROBLEMS WORTH STUDYING

Some of the most valuable work ever attempted in this country to determine the value of mulching and fertilizing for apple trees has been carried on, for many years, by Prof. J. P. Stewart, of the Pennsylvania Agricultural College. While others have been attempting comparative experiments on a few acres, or, as is the case in Maine, for a short period, the work here outlined covers nine years and two or three hundred orchards all over the state, started under varying conditions and set on all kinds of soil. It is the thoroughness of the work done which commends it to the orchardists of Maine. Nowhere else do we find the same valuable data, and the careful reading of the article is urged, as well as the trying out of the system on New England orchards. Something is wrong with the apple industry here, and we get but little help at home. Apples are uneven in size and wanting in color, two very important conditions, when we go into the market to compete with western fruit. We must improve in these two essentials, as well as give careful attention to spraying. The conclusions reached by local theorists is that fertilization is not to be endorsed, yet the trial has been made on a very small area and not on the varying conditions of soil found in the orchards of the state. We face serious complications where the industry is to be tested as it has not been in the past. Greater uniformity in size, more color, and increased yield per tree constitute the problems facing the grower of this state, and with these there goes another of special importance—the improving of conditions by such means as will increase yield and the net profit per barrel grown. There is no question about the benefits of cultivation, but the farmer must know that it will pay him more per barrel than any other system before he can afford to commit himself to the practice. The illustrations here presented tell their own story, and the careful reading of the text will bring home the lesson of greatest possible importance to the grower. The Farmer is under obligations to the Pennsylvania Farmer for the text of Prof. Stewart's clear setting forth.

He says:

It is the wide dupication of the experiments, over a great variety of soils and conditions, that has enabled us to secure definite and positive results, where so many others have failed.

When these experiments were started in 1907, there was a great deal of doubt and uncertainty as to the value of fertilization in orchards, especially with commercial materials. The idea was becoming established, even among earnest and efficient horticulturists, that trees were different from other plants, that their wide root range, long growing season, biennial bearing habits, and generally hardy nature made them indifferent to the usual need of other crop plants for at least occasional assistance in the matter of additional plant food. This impression also is undoubtedly correct in part—a fact which makes fruit and nut production so well adapted to many of the eastern and southern soils. But even trees will not run along indefinitely and maintain their best growth and production without some assistance of the right sort and at the right times.

These facts have been abundantly demonstrated in Pennsylvania group of experiments. In one case, for example, the unfertilized trees have averaged from 78 to 85 bushels per acre annually during the last five years, while the adjacent trees receiving the proper fertilization have averaged 180 to 216 bushels. These trees, moreover, were relatively young, the above yields being produced in their tenth to fourteenth years. In more mature trees the annual net gains from fertilization have ranged from 150 to 325 bushels per acre on the average for a period of seven years. In the latter case the best of the unfertilized trees have averaged a trifle over 208 bushels per acre.

It must not be supposed, however, that such gains as these can be secured in every orchard. In some cases the yields are being retared by other conditions, such as a deficient moisture supply, a frosty or otherwise improper location, poor spraying, or too much pruning. These difficulties naturally can only be remedied by proper attention to them. But after these actors have received the proper attention, or wherever they seem to be satisfactory already, and the trees are still below normal in growth and bearing, it is quite likely that fertilization of the right sort is the most important need.

What Fertilizers Are Needed?

Assuming, then, that we have an orchard in which the growth, fruiting, and other general conditions indicate the need of fertilization, the next matter of importance is to make sure that one is using the right materials. The only certain method of doing this is to run a little test of he sort described later, but in he meantime, in the light of all our experiments, we may say that in the average orchard potash is needed least often and nitrogen most often. This incidentally happens to be a fortunate condition just at present in view of the fertilizer market.

Phosphorus by itself has given no benefits, although applied in four experiments and over a five-year period. When added to nitrogen, however, this combination has generally resulted in greater benefits than any other fertilizer treatment, not even excepting the combination of all three materials. This does not mean that potash is never required by trees, as we have one important experiment in which it is still proving to be the leading element. It does mean, however, that in most cases proper additions of nitrogen and phosphorus are all that is needed to supplement the present resources of the soil. The caustic action of the sodium in nitrate of soda and that of the gypsum in the acid phosphate are doubtless influential in bringing about this effect.

How Much to Apply

As to quantity of materials, an application of 25 to 30 pounds of nitrogen, at least half of which is carried in nitrate of soda, and about 50 pounds of phosphoric acid, carried perhaps preferably in acid phosphate, is usually sufficient for an acre of bearing trees. Two applications of nitrate of soda, of 100 pounds each, preferably applied about a month apart, would furnish the nitrogen; or a slower acting carrier, such as dried blood, could be used for about half of this element, and then apply it all at once. The former method is usually cheaper and also more effective, especially when used as a top dressing. The phosphorus can be carried in about 300 to 350 pounds of acid phosphate, or in equivalent amounts of ground bone, floats, or basic slag. If potash is available and thought to be needed, an application of 30 to 50 pounds of the high-grade muriate, or its equivalent, is likely to be enough.

The nitrogen may be obtained wholly or partially by the use of stable manure or leguminous plants if they are available. In the Pennsylvania experiments, however, the artificial applications of nitrogen have usually been much more effective than those obtained by the use of leguminous cover crops. This may be accounted for by the probability that the reduction in moisture, occasioned by the growth of the cover crops, apparently neutralizes the benefits which should be secured from the additional nitrogen fixed by the cover crops. This effect, however, may not be observed in all soils, and is less apparent in seasons of abundant rainfall.

Stable manure at the rate of about eight tons per acre annually is generally advisable, although it is much slower acting than commercial nitrate applications—often requiring a year longer for important results. A good mulch of manure, however, is one of the best treatments that can be applied to a young apple tree. It has also been most efficient in increasing the average size of the fruit in bearing trees.

None of the fertilizers has materially improved the color of the fruit, and those containing nitrogen have generally reduced it, as compared with the checks at any given date. This is simply due to delayed maturity, which is often an advantage with the varieties of more northern origin, such as Baldwin, Hubbardston, McIntosh, etc., and it is readily overcome in them by delaying the picking. With varieties requiring a longer growing season, however, such as the York Imperial, it may also be necessary to utilize other aids to color, of which the most important are open pruning and sod culture, in order to overcome the ill effects of nitrogen on color.

Time and Method of Application

The time of application is important, especially in the case of nitrates. Present evidence indicates that these materials may often be applied too early in the season. Furthermore, there is evidence which leads to the opinion that distinct harm may result from their application at fruitlsetting time, especially in the case of the peach. It seems, therefore, that for apples the nitrates hould be applied not earlier than bud-opening time, and probably not later than the middle of June. In general, the middle of this period should do very well, although some of our most striking results have come from applications made as late as the 8th of July.

Manure or other organic carriers of nitrogen may be applied at any time from early spring to the middle of June without danger of material loss or ill effect. The time of application of the other ingredients of the general fertilizer suggested is much less important, hence they may be applied with the carrier of the nitrogen.

By postponing the application of fertilizers until after the fruit has set, an opportunity is given to vary the rate in accordance with the amount of fruit set on the trees If the crop is light, much smaller applications are required because of the natural tendency to develop a sufficient number of fruit buds in the off year. If the crop is heavy, the applications should be rather liberal in order to avoid, if possible, the total failure of the crop the following year, and ultimately to steady the yields. This plan should save considerable outlay in a series of years, and should also enable one to secure the greatest possible return for the fertilizers applied.

The method of application followed is that of scattering the fertilizer or manure broadcast over the surface of the soil, care being taken to keep it at some distance from the tree trunk, where there are few absorbent roots, and to extend the applications well beyond the spread of the branches. The application should be heaviest under the outer two-thirds of the spread of the branches, and it may either be left on the surface to be washed in by the rains, or it may be harrowed or lightly plowed into the soil. After all is done, it should be remembered that as a rule the fertilizer applied in any given season cannot matterially affect the yield of the year in which it is applied, since the fruit buds are formed in the latter part of the preceding season. No important results, therefore, should be expected before the following season at the earliest, and if other conditions are not satisfactory the results may not appear until considerably later.

Adjusting the Fertilizer to Local Needs

Wherever the orchard interests are large, it is advisable to accompany the use of the general fertilizer suggested with a local test in order to determine the exact needs of the particular orchard involved. Such tests will enable the grower to modify the more general formula so as to give the best possible net results.

Plan for Local Orchard Fertilizer Test

(Pounds of Fertilizer for a Mature Tree in Bearing)

1. Unfertilized plot.
2. Nitrate 2 lbs.; dried blood 3 lbs.; acid phosphate 10 lbs.
3. Nitrate 2 lbs; dried blood 3 lbs.; potash 2 lbs.
4. Acid phosphate 10 lbs.; potash 2 lbs.
5. Unfertilized plot.
6. Nitrate 2 lbs.; dried blood 3 lbs.; acid phosphate 10 lbs.; potash 2 lbs.
7. Same as No. 6, plus lime, 12 to 25 lbs.
8. Manure 400 lbs.
9. Unfertilized plot.

The plots selected for this test should be located in a typical part of the orchard, and should include at least six average trees, of the same variety and age, in each treatment. If possible the plots should be laid out in double rows of three trees each, and if two or more varieties are involved, each plot should be arranged to include equal number of each variety. All trees should be labeled and carefully measured at a fixed point on the trunk, and definite records of their yields and growth should be kept for at least three years. Frequently

WE ARE STILL SELLING STRAWBERRY PLANTS

It is not too late to start a patch of "Dunlaps." Price $3.50 a thousand.

JACOB BROS., Diamond Imp., 15 Toronto Arcade, Toronto

good indications of the needs of an orchard may be obtained in much less time, especially if the need is great, but this period should be allowed, and a longer one should be used if necessary.

The materials for this test are indicated in the proper quantities for each bearing tree instead of in amounts per acre as above, and in both cases proportionate reductions should be made for younger trees. In other words, if ony one-third of the amount of fertilizers recommended should be used, so that the rate of application may be kept within proper bounds. The careful operation of this test for the period suggested should readily determine if fertilization really pays, and which of the principal fertilizer elements is the most needed in any particular orchard. —Maine Farmer.

TWIG BLIGHT ON APPLES

Last year Twig Blight (Bacillus amylovorus) was very prominent on the apple trees throughout the state. This was perhaps due, to a large extent, to the peculiar spring conditions.

Twig Blight, also called Fire Blight, or Blossom Blight, is a bacterial disease, and usually enters through the flowers or through a bruised portion of the stems or leaves. Trees which have abnormal growths, such as water sprouts, or on the other hand, very slow-growing stems, seem to be attacked more readily than healthy, normal trees.

Soon after the tree becomes infested the tip leaves on many of the twigs take on a yellowish appearance. These later turn to a dark brown color and shrink up. A little later the whole spur dries up and dies. As a rule, many of the twigs on the trees are infected; this gives the tree the appearance of being fire swept. Fruit on infected branches takes a yellowish, shriveled appearance, and later dries up.

The disease is transmitted by means of germs These may be carried by the wind, by insects, or by the diseased portion coming in contact with healthy branches.

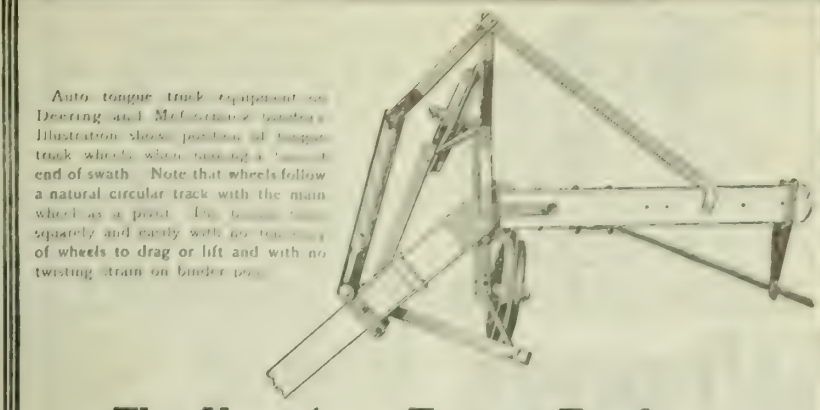
The damage done by the disease is mainly in preventing the setting of fruit. In some cases branches are killed, and in extreme cases the whole tree is killed.

To destroy the disease, all the infected portions should be pruned off as soon as possible after they appear. Each cut should be made several inches below the diseased portion. After each cut the instrument should be disinfected by dipping it into a pail of corrosive sublimate (bichloride of mercury), 1-1000 solution. This prevents the carrying of the germs by the instrument. All the cut branches should be removed from the orchard as soon as possible, and burned, to prevent the disease spreading from this source.

The disease, in some cases, forms Holdover Blight, or Canker Blight, and it is in this stage that it remains dormant during the winter, to break out again in the spring as Twig Blight.

The Holdover Blight, or Canker Blight, is formed on the branches or trunk, but more often in a crotch of two branches. It is darker than the surrounding wood, and has a shriveled, cracked appearance. This can be killed to a certain extent by cutting out all of the diseased portion and then washing the wound with corrosive sublimate (1-1000 solution).

These cankers can be cut out during the winter pruning.—E. F. McKune, Colorado Agricultural College, Fort Collins, Colorado.



Auto tongue truck equipment on Deering and McCormick binders. Illustration shows position of tongue truck wheels when turning a short end of swath. Note that wheels follow a natural circular track with the main wheel as a pivot. Enables binder to cut squarely and easily with no raising of wheels to drag or lift and with no twisting strain on binder pole.

The New Auto Tongue Truck on Deering and McCormick Binders

THE announcement of a new auto tongue truck on Deering and McCormick grain binders this year is great news for Canadian farmers. It means less work and less expense for them at harvest time.

With this new auto tongue truck the binder pole is held in line with the truck pole. An 8-foot binder enters the grain and continues to cut as squarely as a 6-foot machine.

Equipped with this auto tongue truck, the binder cuts a full 8-foot swath without crowding the horses into the grain—a gain in the width of every swath, with far less work for the driver.

Auto tongue truck wheels are fitted with removable dust proof bushings, equipped with hard oil cups. When a bushing wears out, you put in a new one instead of throwing the whole wheel away.

This new tongue truck is one of the most important improvements made on binders in the last ten years. Do not fail to see it at the local agent's place of business next time you are in town, or write us at the nearest branch house for details.

MIXING VARIOUS INSECTICIDES

Now that one has to fight the codling moth, the San Jose scale, canker worm, plant lice, and other insects, besides the apple scab and other fungous diseases, it is advisable to apply two or three materials at the same time. Certain materials can be mixed together with safety, while others in combinations either lose their efficiency, due to chemical changes, or they may prove injurious to the tree. It is important, therefore, to know what ones can be mixed safely. The following list has been prepared at the New York station:

Better results are obtained by mixing paris green or arsenate of lead with bordeaux mixture than by applying them separately.

Properties are not changed by mixing lead with tobacco or bordeaux, lime sulphur with tobacco, soap with tobacco or emulsions.

Efficient and non-injurious are lead with lime sulphur, soap with tobacco.

Inefficient but non-injurious, are lime sulphur with soap, acids or emulsions.

Safe and efficient triple combinations are lime sulphur, lead, and tobacco; bordeaux, lead, and tobacco.

Dangerous combinations are paris green with lime sulphur, soaps, or emulsions; arsenate of lead with soaps, emulsions, or alkalies; emulsions with lime sulphur, zinc arsenite, or arsenite of lime with lime sulphur, soaps, or emulsions; arsenate of lead or paris green with soda or potash sulphides, soaps or emulsions.

FOR GARNISHING DISHES

Parseley, as every cook knows, is almost indispensable as a flavoring for soups and sauces, as well as for garnishing meats, fish, and salad dishes. But what every one does not know is that parsley may be wintered over indoors and thus be made to do duty all the year around. For this purpose the best way is to start the plants in open ground in early fall, and on the approach of cold weather transfer to a light kitchen or cellar window. The seed may be started in the house, but it germinates somewhat slowly, and the plants are feeble at first. Use a rich loam, and keep moist, but not too much so. There are several varieties of parsley, which may be looked up in any seed catalog.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.
If you, my sister are [illegible] health, and feel unfit for household duties social pleasures, or [illegible] just how you suffer, and let me send you free and prepaid a trial of a **home treatment** suited to your needs; with references to [illegible] how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, your mother, your sister, your daughter, or your mother-in-law. I want to tell you how you can cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience**, we know better than any doctor; and thousands have proved that there is hope even for the hopeless in my method. If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, **falling or displacement of internal organs, ladder irritation with frequent urination, obstinate constipation or piles, pain in the side, irregularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send today for my complete ten days' treatment free and **postpaid**, to prove to yourself that these ailments may be cured at your own home, without the expense of hospital treatment. In the hospitals of America everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured**, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all—young or old. Mothers, Daughters, I will explain a simple home treatment which speedily and effectually checks excessive drains (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with your work. **Is health worth asking for?** Then accept my generous offer. Write for the free treatment and to you needs, and I will send it in plain wrapper by return mail. Don't send a penny; just send this offer, mark the places that tell your feelings, and return to me. **Write and ask for the free treatment to-day**, as you may not see this offer again. Address:

MILK FEVER CHIEFLY ATTACKS COWS OF THE DEEP MILKING STRAINS

Milk fever, also known as parturient apoplexy, not only is peculiar to the cow, but attacks only cows of the improved breeds and of deep milking strains. It chiefly affects cows that have been developed in the direction of early maturity, rapid fattening, or a heavy production of milk. The victims are not always fat when attacked, but they are cows with great powers of digestion and which have been fed heavily previous to the onset of the disease. Cows are seldom affected until they have reached full maturity and are at the most productive period of their lives—that is, from five to eight years of age.

In heavy-milking cows all the food eaten in excess of that required to make up for the normal waste of the system is turned into milk. When the flow of milk ceases, if the animal is fed heavily the excess of nutriment from the food has no avenue of escape, and is consequently stored up in the glands and in the blood, causing the animal to become unnaturally plethoric, or affected by excessive nutrition. After the delivery of the calf the blood which has been supplying the fetus is suddenly turned into the circulation of the mother, and if she does not begin the secretion of milk promptly the plethora of her blood rapidly increases.

Symptoms of Disease

The disease usually manifests itself within two days after the birth of the calf, although in rare instances the cow becomes affected prior to parturition. Great uneasiness is one of the first noticeable symptoms. The cow steps about restlessly and refuses to eat or drink. She may soon begin to show signs of abdominal pain. Paralysis begins to be manifested within a few hours, being indicated by a staggering, uncertain gait. The patient now become quieter, rapidly weakens, and finally goes down and is unable to rise. The head is drawn around to one side, usually the left, producing an attitude that is not often seen in any other disease. The animal soon becomes quite unconscious.

The temperature, at first elevated, tends to become lower as stupor and coma progress. The bowels may become torpid or completely paralyzed, and unless improvement is brought about they are not likely to operate again. The bladder, too, is paralyzed and fails to expel its contents. Action of either bowels or bladder, or both, is always a favorable symptom.

The torpor of the digestive organs nearly always causes grave disorders; the paunch becomes the seat of fermentation, producing gas and excessive bloating. There are frequent belchings of gas or food, which, reaching the paralyzed throat, pass in part into the windpipe, causing inflammation of the air passages and lungs, which condition often becomes the immediate cause of death.

Means of Prevention

For such a serious disease prevention is more important than treatment. Among the most effective means of prevention may be mentioned a restricted diet for a week or two before calving and for at least four days afterward. Free access to salt and water is important, as the water serves to dilute the dense, rich blood, and salt encourages the animal to drink. The water should be warmed suitably, as iced water may have a bad effect.

A cow that is in a very plethoric state, or that was attacked by milk fever at her las parturition, should be given a purgative dose (one pound) of epsom salts twelve to twenty-four hours before parturition is due. A most important precaution in a plethoric cow is to avoid drawing any milk from the udder for twelve to twenty-four hours after parturition. Daily exercise is of importance, and the value of the open air cannot be overestimated. Rich clover pastures should be avoided.

Method of Treatment

It is a good practice to give a dose of purgative medicine if the air treatment, to be recommended later, is not available. Epsom salts two pounds, carbonate of ammonia one-half ounce, nux vomica one-half dram, is a good preparation to use at this juncture. The bowels and bladder should be emptied, the former by hand and the latter by the use of a small rubber tube. Bags of ice may be applied to the head. Benefit is often derived from the administration of twenty drops of tincture of aconite every four hours. The application of water, as warm as it can be borne by the hand, to the back and loins acts by removing the blood pressure from the vital organs.

In view of the great superiority of the inflation of the udder with atmospheric air as a curative for milk fever, medicinal treatment is seldom attempted at the present time. By former methods of treatment the losses were very great; but by the use of the air treatment in skilful hands it is claimed that more than 96 per cent may be saved. A large syringe or injection pump is used (a pump for inflating bicycle tires serves the purpose nicely). The whole apparatus should be sterilized before it is used. Boiling for twenty minutes will afford suitable sterlization. The intake opening is filled with sterilized cotton, while a milking tube is attached to the delivering tube.

The teats of the cow should be carefully washed and dried, after which the milking tube on the pump or syringe is inserted into each in turn, while an assistant distends each quarter of the udder with air, without continuing the process after the udder is fully expanded. The tube is now withdrawn and a broad tape is tied around the free end of the teat to prevent the escape of the air. The tube should be disinfected by dipping in a 3 per cent solution of cresol compound or carbolic acid after each application. Should no indications of improvement be apparent at the end of two hours, the udder should be inflated again.

BUTTER MAKING

The question is frequently asked: "Which is the more profitable, making butter at home or selling cream to the creamery?" So many factors enter it that it is almost impossible to answer the question for all parties concerned. In general, when a uniform quality of butter can be produced and sold on a ready market at a fair price, and the

Made in Two Styles

making and maketing affords useful employment for members of the farmer's household, but does not inflict hardships on any of them, the making of butter at home is advisable. If, on the other hand, trouble is experienced in making a uniform quality of butter, if the butter must be sold at a comparatively low price at the local stores, if extra help must be hired in order to make and market the butter, or if these operations impose an unreasonable burden on any member of the farmer's family, it would be advisable for the farmer to allow the creamery to handle his product.

The manufacture of good dairy butter depends upon condition of cream, care of cream before churning, cleanliness of product and utensils, control of temperature, efficiency of churning, and working.

The process of making good butter of uniform quality really begins with the production of the milk. Milk from unhealthy cows can never be made into first-class products. Neither can cows that are kept in unclean or unsanitary places produce clean, wholesome milk. More depends on the care given the milk and cream before entering the churn than on the butter-making proper, although one must understand the principles before he can make good butter.

For the best quality of butter, a rich cream testing 30 to 35 per cent should be used. As soon as milk is separated the cream should be cooled immediately by placing cream in a deep, narrow pail or a shotgun can, and put this in cold water just pumped from the well, or by placing in a water tank. Warm cream should never be mixed with cold, as this causes souring in a very short time. The cream should be kept cool until a few hours before churning, when it should be taken out and allowed to sour naturally or by use of commercial starter. The best temperature for allowing this cream to sour is 70-80 F. When sufficient acid or sourness has developed, the cream is again cooled down to churning temperature. The proper amount of acidity depends upon the kind of cream, quality of butter desired, and churning temperature. As a rule, from 4 to 5 per cent acid is the desired amount.

The cream should be allowed to stand about two hours at churning temperature in order to have all fat globules at same temperature. For ordinary farm churning, a temperature from 60 to 75 degrees F. is best. Fresh cream should not be added for 12 hours before churning, as it will not churn out so thoroughly. The churning temperature is affected by season of the year, kind of feed given the cows, lactation period, condition of cream, and temperature of churning room.

If butter is to be colored, a desirable commercial butter color can be secured from any dairy supply house. Add this according to market, but usually about 2 oz. to 100 lbs. of butterfat. Color should be added to cream in churn just before starting to churn.

The churn will always do its best work when less than half full. The proper speed will depend upon size of churn and condition of the cream. The length of time necessary will vary, but ranging from 15 to 30 minutes.

Often in fall or early winter farmers experience difficult churnings, which are frequently caused by condition of cream from cow far advanced in lactation period, at which time the fat globules become smaller and harder, making it difficult to collect them into a mass of butter. Such difficulties can usually be overcome by ripening cream to higher acidity, churning at a higher temperature, and separating a thicker cream.

The churn should be stopped when the granules are about the size of wheat grain or split pea. When granules reach this size buttermilk is drawn off, allow to drain well, then wash with water at a temperature nearly the same as that of muttermilk or one to two degrees older, adding about the same amount as there was buttermilk; revolve churn 10 to 12 times at ordinary speed.

Salt may be added to butter in churn at the rate of one ounce to one pound of butter, or by placing butter on table or worker and working salt in with paddle or mechanical butter worker. It should be worked until salt is well distributed and butter is collected into a firm mass. When the butter has been sufficiently worked it should be printed into some desirable shape and size, depending upon market and amount made at each churning. Butter should not be stored for any length of time before delivery unless one has cold storage facilities.

Temperature, care, and cleanliness are three vital factors in good buttermaking; therefore it is absolutely necessary that maker should have a few dairy thermometers on hand and watch the temperature. Be sure and use plenty of hot water in cleaning utensils so as to remove all dirt and grease. All wooden utensils should be cooled with cold water before being used; otherwise butter will stick to sides.—J. F. Thomas.

98% Of the World's Creameries
Separate their cream with a
DE LAVAL

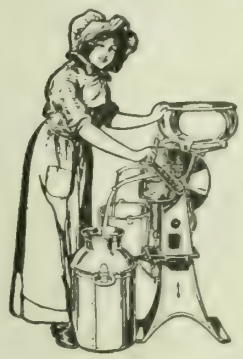
TEN YEARS AGO THERE WERE A DOZEN DIFFERENT MAKES of creamery or factory separators in use. Today over 98 per cent of the world's creameries use De Laval Separators exclusively.

IT MEANS A DIFFERENCE OF SEVERAL THOUSAND DOLLARS a year whether a De Laval or some other make of separator is used in a creamery.

EXACTLY THE SAME DIFFERENCES EXIST, ON A SMALLER scale, in the use of farm separators. Owing to the fact, however, that most farm users do not keep as accurate records as the creameryman, or test their skim-milk with the Babcock tester, they do not appreciate just what the difference between a good and a poor separator means to them in dollars and cents.

NOW IF YOU WERE IN NEED OF LEGAL ADVICE, YOU WOULD go to a lawyer. If you were sick you would consult a doctor. If you had the toothache you would call on a dentist. Why? Because these men are all specialists in their line, and you rely upon their judgment and skill.

WHEN IT COMES TO BUYING A SEPARATOR WHY NOT profit by the experience of the creameryman which qualifies him to advise you correctly? He *knows* which separator will give you the best service and be the most economical for you to buy. That's why 98 per cent of the world's creameries and milk dealers use the De Laval exclusively.



THERE CAN BE NO BETTER RECOMmendation for the De Laval than the fact that the men who make the separation of milk a business use the De Laval to the practical exclusion of all other makes of cream separators.

Your local De Laval agent will be glad to let you try a De Laval for yourself on your own place. If you don't know the nearest De Laval agency simply write the nearest main office, as below.

SCOURS IN CALVES

It is well for the breeder to be on the lookout for one fo the most troublesome complaints of the young calf that he has to contend against.

The disease may appear at any time subsequent to birth. The sick calves appear dull, weak, have sunken eyes, and heavy breathing. The discharges from the bowels are of a yellowish white consistency and very offensive. The case will become aggravated, and if not checked death will occur in two or three days. It is very essential that the persons looking after them should be with the sick calves several times each day in order that the disease may not become serious before it is detected.

The Kentucky Experiment Station, which has done some excellent investigation work in the cause of farming science, has used the following drugs very successfully in the treatment of scours during a period of eight years, during which time not one single calf was lost through the disease, although on an average twenty have been born every year.

Treatment consists in this: When a calf was known to be developing a case of scours it is taken in hand immediately, placed in a clean stall, well bedded, and given a dose of two ounces of castor oil, one tablespoonful of listerine, and tablespoonful of paregoric. All these ingredients are mixed thoroughly, put in a long-necked bottle, and given to the calf in the form of a drench. A baby's feeding bottle graduated into ounces is very useful for giving the dose.

If necessary, the dose may be repeated after six hours. If the case is a very severe one, ten drops of laudanum should be mixed with the ingredients above. Calves three or four months old can often be cured by giving them three ounces of castor oil, which will flush out the digestive system and relieve it of the irritating substances causing the scours.

FIFTY SHEEP FOR ONE YEAR

Editor The Maritime Farmer:

In this article I purpose showing the returns and profits accruing from a flock of fifty sheep during the course of a year. The year began October 1st, 1914, and ended October 1st, 1915. The sheep were grade Shropshires. The housing was in an open-front shed 20 x 30 feet. The farm was an average Cape Breton farm of 200 acres, situate twenty miles from Sydney. The farmer was a canny Scotchman, a descendant of the original Scotch immigrants who came to Canada in the year after the war of 1812. He was a good business man and a thorough farmer.

Now that I have dealt with the more important facts, I will proceed with the minor details: The sheep were left on pasture during the month of October. On November 1st they were put into winter quarters. The change from pasture to winter quarters was gradual; a large yard was fenced in around he shed, and from this a lane led to a pasture field. However, the sheep seemed to prefer winter feed once the grass was burned by the fall frost.

The winter ration was as follows: Each day the sheep received four pounds of hay, two pounds oats, and four pounds turnips per head. The hay was principally clover, with a little Timothy mixed. The oats were not of first quality, but were fairly good, although not entirely free from chaff. The best quality of oats was retained for horse feed or for sale. The turnips were run through a root cutter and chopped rather fine.

The hay was fed one half in the morning and the other half in the evening. The roots and grain were fed mixed at noon. The bottom of the hay rack was made tight, and made an ideal place to feed such stuff.

The winter feeding period lasted from November 1st to May 1st, or, to be exact, just one hundred and eighty-one days. The sheep were not fed the full ration at the beginning of the housing period, but whatever was short was made up for after lambing.

Lambing began about the middle of March. The early lambs caused some trouble and inconvenience, but this and the cost of caring for the sheep was amply made up for by the value of the manure.

The increase in the flock was as follows: Five sheep had no lambs at all, and twenty-one sheep had two lambs each, and twenty-four had one lamb each. This was a total of sixty-nine lambs. Six were lost in the spring, and one was killed by dogs or fox in early June. One sheep was lost during the winter.

Pasture during the six months was charged at the rate of three dollars per month. This was about all it would be worth as pasture for young stock. Pasture for the lambs was charged up against the flock at the rate of four dollars per month for three months. The cost of caring for the flock totaled up as follows:

Pasture for ewes, six months, at $3.00 per month	$18.00
Pasture for lambs, three months at $4.00 per month	12.00
19 tons hay at $10.00 per ton	190.00
21 tons turnips at $2.00 per ton	42.00
270 bushels oats at 40c per bushel	108.00
Lost one ewe at $10.00	10.00
Interest on cost of housing at 6 per cent	9.60
5 per cent depreciation on cost of building	8.00
Total cost of fifty sheep for one year	$397.60

Now, against this the total income from the flock in the year's operations was as follows:

50 fleeces, averaging 8 bs. each, less cost of shearing, at 32c per lb.	$120.00
29 lambs averaging 40 lbs each, at 18c per lb.	208.80
16 lambs averaging 48 bs. each, at 18c per lb.	126.08
14 lambs averaging 55 lbs. each, at 13c per lb.	100.10
59 lamb pelts at 65c each	38.35
Total income equaled	$593.33

The profits were as follows:

Total income equaled	$593.33
Less cost of upkeep for year	397.60
Total profit for flock	$195.73
Total profit per ewe	3.91

The above figures require a few words of explanation. The shed where the sheep were wintered cost about one hundred and sixty dollars. Interest on this at six per cent would amount to $9.60. This, of course, was charged against the flock. The building was calculated to last 20 years. Thus five per cent, or $8.00 per year, would be sufficient to charge for depreciation. These two items are very often neglected when charging profit and loss on farm operations. Shearing cost eight dollars, as no experienced men could be got. The wool sold for thirty-two cents unwashed, though later in the season it went as high as fifty cents per lb. The first lambs sold were the lightest and sold for the highest price. These were all sold at retail, and some charge for marketing should perhaps be made; however, as other produce was sold at the same time, it would be hard to arrive at the definite cost of marketing the lambs.

JOHN H. MacDONALD,
Cape Breton Co., N. S.

NATURAL FLESH IN CATTLE DEMONSTRATED

During the recent short course at the Iowa State College two calves, not old enough for veal, furnished a valuable lesson. Their carcasses showed the bodies before milk had had its effect in filling the fat veins and expanding the flesh. One of the calves was a thick, stocky youngster of Shorthorn ancestry; the other a delicate, thin, fawn-colored Jersey type. The difference in amount of inner muscle or lean meat in beef and dairy cattle is appreciated by too few people, particularly those who put cattle into the feed lot to be fatened for market. Demonstrations of this kind arrest attention and make the contrast strong, not for a comparison of the beef and dairy breeds, and so belittling the latter, but to show the depth of flesh necessary in beef animals.

Beef and dairy cattle have separate interests. Each class has its place, and well fills that place. Beef and dairy qualities cannot be solidly combined in one animal. The Shorthorn more than any other breed more nearly shows both these qualities. These qualities are distinct when developed in their highest degree. The beef producer, either breeder or feeder, must realize that a full quota of inner muscle or flesh is indispensable. When the breeder is selecting a bull he must not trust to straight lines and quality alone, but must see that the body is well equipped with flesh, that it may be transmitted to the calves; or when the feeder is buying stock cattle he must see that he has not even one of the dairy type, because it means an unprofitable gain and a cut-back when marketed.

Flesh is the foundation upon which to fill, cover, and enrich the carcass with at. The fat steer has the same lean meat proportionally as the calf. The natural flesh must be on the body at birth, because fat does not make additional muscle fibres; it merely grows those given by inheritance and expands them up to the adult stage. It is done by filling the several fat veins throughout the system, broadening the muscle tissue by furnishing adipose tissue at the fully ripened stage.

In the dual-purpose animal the fat is only in part stored upon the back; much of it is diverted to the udder. Thus the fat-forming compounds of the feed are divided. They produce less beef but more milk than in beef animals. The more milk formed the less beefy will be the animal.

Few stockmen fully realize the great importance of natural flesh. It is well to know conformation, but to know the composition is more important.

The carcasses of these two calves showed the points of difference plainly. The beef calf had a thick, heavily muscled thigh, round, full buttock, and a deep flank; the dairy calf a thin, scrawny leg, thin buttock, and hollow flank. One was a true beef animal, with thick loins and plenty of lean meat or muscling along the back, and over the ribs; the other a dairy type, with a flat loin, sharp chine, thin ribs, or bare of flesh. A smooth, thick, well-rounded shoulder was found on the beef calf; a thin, scrawny, shelly shoulder on the dairy calf. As the flesh was then, so it would have been had the steers been fattened for market. We would have a thick, plump, market-topping beef steer, and a long-legged, shallow-ribbed, light-fleshed steer with a cheaper market value. These statements present, substantially as given, the remarks made by "Uncle" John Gosling, of Kansas City, who conducted the demonstration.--Breeders' Gazette.

VALUE OF A BREEDING COW

In following the discussion as to prices of good breeding cows there seems to be much difference of opinion as to what may be considered a reasonable and safe price which a beginner may pay for breeding matrons for a herd foundation. One thing has been lost sight of is that price does not make the animal. The merit of the animal, allowing due consideration for the pedigree and reasonable assurance of her reproducing offspring as good as herself, should be the determining factor in value fixing.

No one will deny that a cow with a record as a consistent producer of high-class progeny is worth much more than one of equal individual merit that has not demonstrated her qualities as a breeder of good stock. Where one has an opportunity of choosing breeding material from such cows carrying blood that has consistently given the breed stock of superior merit and reproductive ability, the price may only be measured by one's financial ability, his fixedness of purpose, and his qualifications for engaging in the pedigree cattle business. There is no other rule for guidance in the breeding business. No one can succeed in the broadest sense who starts out to purchase a foundation herd with a determination in mind to secure so bany cows for a fixed amount of money. That would not be using the kind of judgment that ensures success. Quantity should not and cannot be the governing factor, if one desires to make a success as a constructive breeder.

Make selections of such matrons as have either produced the right kind or come from cows that have made good, and buy them. One of that kind, even though she should cost much more than four or five of the indifferently bred, mediocre sort, will return a greater profit and eminently more satisfaction when mated to a good bull than the others. Her cost will be governed by conditions, demand, and her own reputation, or that of her immediate ancestors as producers of good stock.

I have in mind the record of two cows in the Maxwalton herd owned by Carpenter & Ross—Rosewood 86th and her daughter, Rosewood Pride. The mother was imported by W. D. Flatt, and sold at auction for $925. She and her daughter have long been rated as the most valuable of the reserve cows at Maxwalton. As evidence of what a good breeding cow is worth, and the possibilities of the profit that may be derived from a good producing cow, the record of sales of the progeny from these cows may prove of interest to breeders of beef cattle and those who contemplate engaging in the business. The second calf from Rosewood 86th was Rosewood 87th, by Whitehall Count, a son of Whitehall Sulton. She sold for $200 at auction, and later produced a number of calves that sold in excess of $1,000. The third calf was Maxwalton Rosewood, by Avondale. She produced the noted sire Double Dale, and brought $1,000 at auction. The fourth calf was a bull by Avondale, which realized $1,000; and the fifth calf, the noted bull Silverdale, brought $1,330 at a Maxwalton sale. In the following order her calves brought the prices given: Pride of the Dales, $1,000; Pride of Avon, $800; Rosewood Lady, $300; Dale's Farewell, $1,000. Maxwalton Rosewood 3d, a yearling heifer, and a bull calf are in the Maxwalton herd. Here is a total for the progeny sold of $6,630. Her daughter Rosewood Pride's first calf sold for $280. Then follows The Callant at $1,000, Whitehall Rosedale at $2,325, Maxwalton Rosedale at $600, Pride of Albion as a calf at $1,800, Maxwalton Pride at $500, Avon A Dale at $600, Maxwalton Pride 2d at $800, and a yearling heifer and a heifer calf in the herd, with a total in cash for progeny sold of $7,905. This makes a total of $14,535 in cash sales from two cows, mother and daughter. Lady-in-Waiting, in the Anoka herd, held a record as a producer exceeding these, her progeny selling for $13,000 There are many

Worms Make Children Peevish

Some symptoms of worms are: Deranged stomach, swollen upper lip, sour tongue, offensive breath, hard and full belly, with occasional gripings and pains about the navel, pale face of leaden tint, eyes heavy and dull, twitching eyelids, itching of the nose, itching of the rectum, short, dry cough, grinding of the teeth, little red points sticking out on tongue, starting during sleep, slow fever. If you have the least suspicion that your child is troubled with stomach worms or pinworms, don't hesitate—get a bottle of Dr. True's Elixir. This remedy has been on the market over 60 years. Put your child on the way to good health by using Dr. True's Elixir, the Family Laxative and Worm Expelled. Good for adults also. At dealers', 35c, 50c and $1. Advice free.

similar examples in the breed.

What is a good cow worth, or what should a beginner pay for material for foundation purposes? It all depends on what he is getting for the money, his purpose, his qualifications for the business, and his ability to pay for good ones as he finds them.—Breeders' Gazette.

MAKE WETHERS OF RAM LAMBS

One of the greatest losses in the sheep business comes from the lambs sent to market without having been castrated. The operation is extremely simple, and should not be neglected. The ram develops sexual characteristics at about three months of age. They then become restless, worry the rest of the flock, and fight among themselves. They cease to make satisfactory gains, and prevent the others from so doing.

Experimental feeding of two lots of 12 head each, one lot castrated, the other entire, each receiving the same feed and treatment, resulted in 900 pounds weight for the rams, while the wethers weighed 1020 pounds. Another experiment showed that wether lambs gained in 60 days 2¼ per cent in live weight and four per cent in dressed weight more than did the ram lambs.

Rams become coarse, and their increase in weight comes in the low-priced parts of the carcass. Wether lambs, on the other hand, develop more in loin and back, the region of high-priced cuts.

Upon the Buffalo market the difference in price between ram and wether lambs has ranged from 65 cents to $1 a 100 pounds in the same month in favor of the wether lambs. Quite often ram lambs grade as culls and sell for as much as $2 a 100 pounds less.

If castration is left until past the fourth week it is more severe. The quarters should be as clean as possible for the operation. One of the best methods is to cut off the lower third of the scrotum with a clean, sharp knife, and force the testicles down. They can be grasped by the thumb and two fingers and pulled out, one at a time, with the spermatic cords attached. If the lamb is rather old and the cords will not pull out, they can be scraped off above the testicles. Many sheep breeders use their teeth for drawing out the testicles, but this is a disagreeable practice to many people.

A pan of water containing a 2 or 3 per cent solution of some good disinfectant should be used by the operator in washing his hands and the knife, and the wound should be disinfected after the operation. Ointments, such as carbolized oil—20 parts sweet oil, one part carbolic acid—and pine tar salve—equal parts pine tar and pure lard—are also recommended for dressing the wounds, but it is impracticable to use disinfectants or ointments when the flock is large.

Lambs are sometimes unsexed by cutting off the scrotum close to the belly with heated shears, or with a special emasculator, but this method is not satisfactory. It is not advisable to castrate an aged ram, for the difference in value of the carcass is scarcely worth the trouble.

THE BROOD SOW AND HER LITTER

The brood sow at farrowing should be in good flesh. The very fat sow usually has a weak litter, difficulty in farrowing, and is clumsy, while the very thin sow often has small, poorly nurtured pigs, and is not in condition to milk heavily. Provide a warm pen for farrowing, and be on hand to see that the pigs are thoroughly dried and have a good feed shortly after birth. Give the sow a warm drink after farrowing, and start with a light grain ration, gradually increasing the same to form a rich, nutritious, and succulent ration. A good grain for the newly farrowed sow would be 3 to 6 pounds of a mixture of ground oats, 3 parts; shorts, 3 parts; and oil cake, 1 part. If skim milk is available, give 6 to 10 pounds daily. In the absence of grass, mangels (6 to 8 pounds per day) give excellent results. Exercise the sow and litter daily. Don't overfeed the sow, or sickly, scouring pigs will result.

Feeding the Litter

Make a "creep" in the corner of the pen, and teach the little pigs to eat at 3 to 4 weeks of age. A good ration for the weaning pigs is composed of barley, 3 parts; shorts, 3 parts; and oilmeal, 1 part, fed as a slop. If skim milk, buttermilk, or whey is available, start with 2 pounds and gradually increase to 8 pounds daily. Feed only what the young pigs will clean up. If skim milk, etc., are not available, use Digester tankage or oil cake meal to balance the ration.

Feeding on Pasture

A piece of good pasture set aside for the sows and litters will give excellent returns; the following make good pasture: Alfalfa, clover, rape, rye, oats, or grasses. For weaned pigs, or even thin brood sows, a home-made self-feeder gives as great gains as the best hand feeding, and saves over half the labor. Mix the meal ration and fill the feeder once a week or fortnight, depending on the size of the feeder and the number of pigs. Finish the pigs for market at 6 to 7 months of age, weighing 170 to 200 pounds; you will thus make greatest profit.

AT FARROWING TIME

You can tell when the sow is soon to farrow by the enlargement of her udder. When milk can be drawn she is due within 24 hours.

For a day or two before farrowing an all-slop ration is better than dry feed. Some men give only water the last 24 hours unless the sow shows unmistakable signs of hunger.

Give the sow clean, dry bedding. Shredded corn stalks, oats or wheat straw, or dry leaves are all good. Pigs are likely to get tangled in long straw, so chopped straw is preferable. Barley straw and dusty bedding are very bad.

When the sow burrows a deep, hard-packed nest the pigs frequently get caught and crushed. She is less likely to do this if she is well sheltered and out of the cold.

While the new-born pigs do not need any such care as lambs, they are more sensitive than many people think, and unexplainable deaths later are often due to chilling in the critical first hours. If the weather is cold, put them in a basket lined with straw or chaff, with a blanket over the top, but leave a space for air, as they smother easily. After half an hour's warming let them nurse. If it is very cold it is best to put them in the basket for another hour or so before leaving them with the mother.

To guard against milk fever and to help prevent the pigs from scouring, feed the sow lightly for 24 hours after farrowing. First give a good drink of water, lukewarm, but never cold, then a light bran mash. Be a little more generous each day up to the fifth, after which it is safe to feed abundantly.—G. B. Hill.

The manure of sheep is more valuable, weight for weight, than that of any of the other farm animals; but it is also more liable to loss through fermentation because of its lower moisture content than are the so-called "cold manures" of cattle and swine. Nitrogen is the principal fermentation loss, but leaching will effect both the phosphorus and potash content.

The upturn in the price of hogs makes the spring crop of pigs seem more worthy of sitting up with if necessary. No good farmer ought to begrudge the loss of a few hours if a good litter of pigs may be saved by it. With gilts it is sometimes necessary to be there to save all the little fellows, while again the sow will care for them better if left alone. It all depends upon the nature of the sow. Some are natural mothers and require no watching during the first hours.

THE HORSE

THE COLT DURING HIS FIRST MONTHS

It is a money-losing operation to raise a colt by anything less than the full-feeding system, declares Horse World. Even when the dam is a good milker and has nothing to do but raise her foal, it is better to give the colt a little grain as soon as he will eat it, and that will be found to be at a surprisingly early period in his life. Commence by giving a little grain to the dam from a box placed on the ground so the colt can get at it, and in a few days he will have learned to partake of it. After that it is better to provide a creep into which the colt or colts can go and get the grain without interference from the dam. As the colt grows older, increase the amount of grain given, and when it comes weaning time not only will that period be passed with less danger of stopping the little fellow's growth, but, as he will have been taking less of his dam's milk, it will make it easier to dry her up.

Feeding, however, is not the only attention it pays to give the colt during the first months of his life. For the good of every colt, he should be halter broken before he is two weeks old. In the first place, it is much easier to break a colt to halter when he is a few days old, and the next place breaking at that time is much better for the colt himself, as he is not half as likely to injure himself fighting against the halter as he is when he gets to be a strapping, big, strong fellow five or six months old. Broken when a few months old, a colt never forgets his lesson, and it adds much to the ease with which he may be made acquainted with the harness when the time comes.

Another particular in which the colt should receive attention during the first few months of his life is in regard to his feet. The form of the colt's legs depends largely upon the shape his hoofs assume during colthood. Seldom do the hoofs grow evenly. Sometimes they wear off o nthe inside while the outside remains long, and that influences the bones of the leg to assume a position that causes him to toe out, and in the light harness horse that means a knee-knocker when he comes to be used on the road or track.

Conversely, if the inner side of the hoof is allowed to become high and the outer side is worn off, the colt becomes "pigeon-toed," which is almost as much of a fault as the other formation, which results in his becoming a knee-hitter.

Watch the little fellow's feet closely, and with a rasp keep the hoofs even and of the proper shape. These details will not require much time on any one occasion, and if they are looked after it will add much to the colt's value in after years.

CARELESS FEEDING AND WATERING MAY KILL HORSE

Many horses are killed and many more are injured by careless feeding and watering.

Never water a horse immediately after feeding grain. This washes the grain through the stomach before it is properly mixed with the stomach juices and is liable to cause colic.

If the horse is very warm, let him drink a few swallows and then hold his head up for a minute or two, and thus cool his stomach slowly. Try it yourself in hot weather. You can drink a quart of cold water without injury if you will but take several minutes for the first few swallows.

When horses are brought in hot from their work they should first be given water cautiously and then fed hay and grain together, allowing them to exercise their own judgment in the selection of their feed.

While waiting for them at the watering trough, the time can be profitably used in removing the harness, at least the collar, and cooling the shoulders by washing in cold water. Removing the hot harness in a hot barn during the hot noon hour is a great relief to the horse and is really worth while.

When a horse becomes colicky or is foundered from too much grain or cold water on a warm stomach, there is no one to blame but the one who had him in charge, and it is he who must be charged with either ignorance or carelessness. Horses are worth money and their services are indispensable. Their care and management should be given more consideration.—Geo. H. Glover, Colorado Agricultural College.

CASTRATING THE COLT

Most farmers and horse breeders castrate colts when they are about a year old. Some prefer to delay this operation until the young animals have reached the age of two years, claiming that this will give them more masculinity. Some excess in development may thus be gained, but if the colts are allowed to go too long they are difficult to handle and there is more risk. At one year old there is not much risk, provided the operation is performed by a competent person with proper regard for cleanliness and the subsequent care of the colt.

The operation should always be performed by a reputable veterinary surgeon, or by some one who has had sufficient experience to work skilfully. The best season is in the spring, at the beginning of warm weather. At

Kidney Disease Cured
Sworn Statement

Of Mr. Wesley Maxwell, Who Gratefully Gives All Credit to Dr. Chase's Kidney-Liver Pills.

It is one thing to make big claims for a medicine and quite another thing to produce irrefutable evidence that it actually cures in serious cases.

We prefer to let the cured ones speak for themselves, and that is why you find in almost every newspaper the report of someone who has been cured by the use of Dr. Chase's medicines. To-day we present the sworn statement of Mr. Wesley Maxwell. When a man goes to this trouble in expressing his gratitude there can be no question of the benefit he has received. Mr. Wesley Maxwell, Orangeville, Ont., writes: "I have been using Dr. Chase's Kidney-Liver Pills, and I must tell you that before I started using them I could only make water with the greatest difficulty, and had very severe pains in the back. I am completely cured now by the use of these pills. Before that I used a lot of doctors' medicine without any benefit that I could see. I am thankful for being cured, and can recommend Dr. Chase's Kidney-Liver Pills very highly."

SWORN STATEMENT

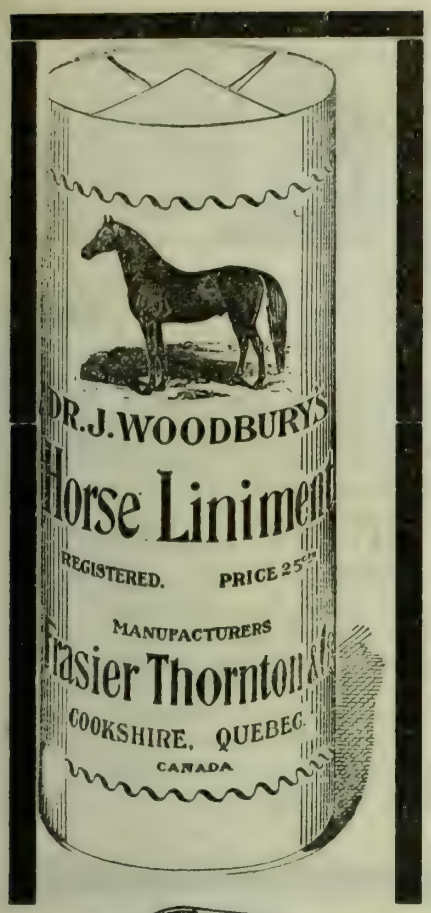
"This is to certify that I, Wesley Maxwell, of the Township of Caledon, was cured of kidney trouble by taking Dr. Chase's Kidney-Liver Pills.

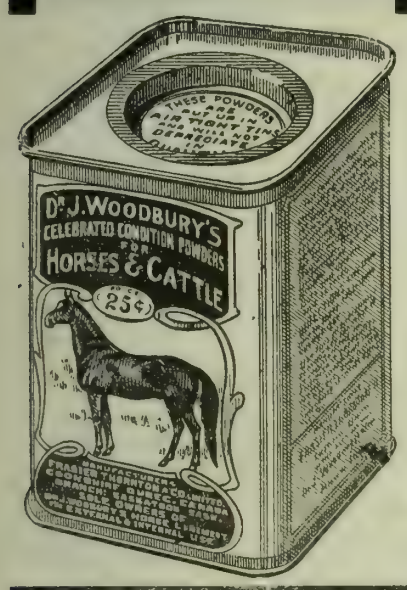
"Wesley Maxwell."

(Sworn before me as correct this 6th day of January, 1915.—Wm. Hawkins, Sen. Justice of the Peace.)

This statement is also endorsed by the Rev. Geo. W. Robinson, who is Mr. Maxwell's pastor.

This cure will interest a great many people who are suffering as Mr. Maxwell was with kidney and urinary troubles. It will only cost you a quarter to buy a box of Dr. Chase's Kidney-Liver Pills and put this medicine to the test. We are sure that you will be thankful to the writer for describing his cure to you. For sale at all dealers, or Edmanson, Bates & Co., Limited, Toronto.





that time the flies have not yet appeared and the weather is comfortable.

After the operation has been performed, with proper regard for clean hands and instruments, the colt should be turned out in a good pasture, with access to a clean shed in case of storm. There is little danger of his "catching cold." The danger of wound infection if he is kept around the barn is serious.—W. F. Purdue.

CAREFUL FEEDING PREVENTS COLIC

Many a horse owner dreads the occurrence of colic in a horse, yet I firmly believe that most cases could be prevented by a few simple precautions. Make it a fast rule always to water your horses before feeding grain and never afterward within a period of three hours. I think there is then little danger.

Over twenty years ago I had a mare down with a serious attack of colic. She had been watered after feeding grain, which was contrary to my habit. I was told that without doubt the watering after feeding grain was the cause of the attack. I therefore made it a strict rule always to water before feeding and never afterward. I have kept four and five horses in my possession during the past twenty years, with only one bad case of colic, by strictly following this rule.

Horses' stomachs are small compared to the size of the animal. If the horse is watered after eating his grain there is danger of washing part of this undigested grain from the stomach into the intestines and causing serious trouble, an dsometimes the loss of a valuable animal.

The best plan is to water a horse, then feed hay, and in about half an hour feed grain. I feed the hay and grain at the same time unless the animal is very warm, as this is more convenient.

My teams are always allowed access to the watering trough when brought to the barn at noon and evening, unless for some reason they are unusually warm. In this case they stand in the stable for a while without anything to eat until they have been watered, but this is a very unusual occurrence.

If a horse is accustomed to drinking before eating, when coming from work, I do not think it is harmful to give him all the water he wants, even though he is pretty warm. I have never had any bad results from this method.—C. R. Weidle.

OILING HARNESS WET OR DRY?

When I was a boy I worked in a small upper-leather tannery. In dressing the leather the currier always oiled it while it was damp, saying the oil would dry in as the water dried out. I think the way to oil harness is to wash it clean, and oil it while it is yet damp. The harness shops here dip team harness without washing at $1 per set. My boys think it best to oil the leather when it is dry. Which is the better way?—C. C., in Breeders' Gazette.

Captain M. H. Hayes has the following to say regarding this point: "Before applying the fatty matter, especially when the leather is dry, it is advisable to dampen the leather, because when it is in that state it will absorb the oil or grease much more readily than when it is dry." Compositions used to polish "show" harness should never be used on damp leather, however. I do not think much of trying to oil dirty harness without first taking it apart and thoroughly cleaning it. Use warm, soft water, castile soap, and a brush if necessary.—J. L. Edmonds, Illinois Experiment Station.

Galled shoulders are easier and more cheaply prevented than cured. See that none of the mane works under the collar at neck or shoulder; keep the face of collars well cleaned and oiled occasionally. Wash the neck and shoulder of the horse every evening with pure cold water.

Proper adjustment of harness is very essential, especially during the season of heavy work and excessive heat. The collar should be neither too small nor too large—one is about as bad as the other, and either will practically ruin a horse's shoulder in an incredibly short time.

ANY farmer who is using an Alpha will tell you that this engine is a great help to him and that he can absolutely rely on it. The Alpha is a steady, powerful engine that will do a great number of big and little jobs on your farm that now cost you too much in time and labor. You can make your work easier, get it done quicker and save money by using an Alpha.

The Alpha is a smooth running, powerful engine that has proved its value to thousands of farmers in all parts of Canada. It is a reliable engine. You can always depend upon its being in good working order when you want to use it. There are no complicated parts to get out of order and cause time-wasting delays and expensive repairs. Ask Alpha Engine users. What they tell you will be proof of Alpha superiority.

The Alpha starts and runs on a simple magneto. You get a hot, fat spark at all times. You are never troubled with weak batteries. You can use kerosene or gasoline for fuel. The fuel consumption and speed of the engine are accurately controlled by a reliable, sensitive governor. This governor acts the instant there is the slightest variation in the load. Therefore, the engine runs steadily at all times and there is no waste of fuel. The Alpha is not affected by cold weather.

There are many other reasons why Alpha Engine users get the greatest engine value for their money. Every feature of the Alpha is completely illustrated and described in our large engine catalogue. Ask for a copy and read it carefully.

Alpha engines are made in eleven sizes—2 to 28 H. P. —each furnished in stationary, semi-portable or portable style with hopper or tank cooled cylinder.

POULTRY

THE POULTRY RAISER'S OPPORTUNITY

The Present Market Outlook Warrants Greatly Increased Production During 1916

From present indications, Great Britain will require all the eggs and poultry Canada can produce during 1916. Last year, as a result of greatly increased production, Canada was able to ship to Great Britain the largest quantity of eggs exported since 1902, and at the same time reduced her imports for home consumption by nearly a million dozen.

Canadian eggs have found favor in the British market, and the prospects are that, providing they are available, much larger quantities will be shipped this year. The unusually high prices prevailing at the present time are largely due to this anticipated export demand.

Prices for poultry are also high, and will likely continue so for the rest of the season. Last fall and winter all the surplus Canadian poultry was exported at highly profitable prices. Between fifty and sixty cars of live poultry were shipped from Western Ontario to the Eastern States alone, and in the Maritime Provinces, particularly in Prince Edward Island, the export demand for canned poultry has greatly enhanced prices to producers.

Although some uneasiness has existed on the part of the trade as regards transportation facilities in view of the high freight rates and the shortage of boats, it is now reasonably certain that an even greater demand for Canadian poultry and eggs will occur this year. It is important, therefore, that every poultry producer take steps to profit thereby by hatching as many chickens as possible this spring.

Now is the time, by hatching early, by hatching everything possible in the month of May, to guard against the marketing of so much small, undersized, poorly finished poultry, which annually becomes a drug on the market in the fall of the year. Again, it is only by hatching now, and giving the chickens every possible chance to thrive and grow, that a maximum supply of eggs can be obtained in the winter time.

Given their proportionate amount of attention, the growing of poultry brings quick and profitable returns to the farmer. With the increasing cost of meats, milk, butter, etc., there is a constantly increasing demand for poultry and eggs. The labor problem is not critical, as the boys and girls on the farm can readily take care of the poultry. The cost of feed is nominal, prices for poultry and eggs are high—the highest, in fact, for many years. It is obvious, therefore, that Canadians have a patriotic as well as an economic duty to perform in making the year 1916 the banner year for poultry production in Canada.

THE CHAMPION HEN

The Barred Plymouth Rock, No. 414 M, which made such a wonderful performance record at the Maine Agricultural Experiment Station in her pullet year, has begun laying again in her second year, and bids fair to make a record which will equal and possibly surpass, that of her pullet year. As the record stands now, the bird is the highest laying hen of the Barred Plymouth Rock breed that has yet been produced. When it is remembered that it was only a dozen years ago that a record of 200 eggs in a year was considered wonderful, the people of Maine may well be proud of the fact that there has been produced within their state a hen capable of laying 298 eggs in 12 months. Such an achievement shows in a concrete way the practical value of investigations regarding the principles of breeding.

This remarkable bird, No. 414 M, was hatched on May 12, 1914. By many poultrymen this would be considered a late date of hatching. The notion prevails quite widely that unless a bird is hatched in March or April it will never make a great layer. How erroneous this view is is shown by the performance of the bird here under discussion. Hatched on May 12, she laid her first egg on November 4, 1914. She was then 176 days old when she laid her first egg, or just under six months. In the month of November, 1914, she laid 11 eggs. She was evidently at this time trying out her paces and getting into proper condition for an extended record. On the first day of December she began the pace which she maintained to the end of the year. During the month of December she laid 28 eggs, in January 29, in February 25, in March 29, in April 27, in May 26, in June 22, in July 31, in August 26, in September 24, in October 20, making a total of 298 eggs in the year. The longest continuous perious during which the bird laid an egg every day were from December 19 to January 19, or 32 days; from March 11 to April 15, inclusive, a period of 36 days; from July 1 to August 10, inclusive, a period of 43 days.

It is obvious that during this year when 298 eggs were laid, this hen could not have spent a good deal of time being broody. As a matter of fact, she was broody but once during the year. She showed signs of broodiness on June 14, and was put in a coop by herself in the ordinary way that broody hens are treated at the Maine Station. Under these circumstances, she very quickly changed her mind about wanting to sit, and on June 20, six days from the time when she first showed signs of broodiness, she began laying again. This is the only time she has ever been broody in her life.

The last egg of the pullet year was laid October 29, 1915. By November 9 she was well started in moult. She rested nearly three months, beginning laying again on the 30th day of January, 1916. She immediately started in at her old pace, laying 23 eggs in the month of February, 1916; this is only two eggs short of her performance during the corresponding month of her pullet year, when she laid 25 eggs. She is continuing to lay now at the rate of about six eggs per week.

In no respect is this bird a freak. She is simply the result of well planned and carefully executed breeding. She is trim and smart in appearance, of good size, weighing 6.7 pounds at the end of her pullet year's laying. This is unusually heavy for bred-to-lay Barred Plymouth Rocks. There is nothing in her external appearance, shape, or body or type that would mark her out from any one of hundreds of other birds on the poultry plant of the Maine Agricultural Experiment Station. She has three sisters on the plant, all of which fall in the 200-egg or better class. No one of the sisters, however, equalled the record of 414 M.

Regarding the breeding of this bird, it may be said that she came from a very high-laying ancestry. The record of her dam was 210 eggs in a yar. The average production of her two grandams was 212 eggs in a year. If we go still farther back the same thing is found. The average production for one year of her four great-grandams was 194 eggs. It thus is evident that there is concentrated in the blood of this hen high-laying quailties for generations back. This wonderful performer, 414 M, is not inbred at all, in the ordinary acceptance of the term "inbreeding." She represents the bringing together of a number of different blood lines, each one of which has been highly bred for egg-producing ability.

At the present time this bird is bred in the mating pens at the station poultry plant to a cockerel of quite as remarkable qualities as she herself shows. This cockerel, No. 160, weighed nine pounds when nine months of age. This is a remarkably high weight for a Barred Plymouth Rock at that age, and indicates the constitutional vigor and vitality which he possesses. His dam, 63 M, laid 247 eggs in her pullet year. The average performance during the pullet year of the two grandams of this cockerel was 191 eggs, and the average production during the pullet year of his four great grandams was 196 eggs. This cockerel is only very distantly related to 414 M, so that the offspring from this mating will not be inbred at all. They should combine in a high degree the most desirable qualities of utility poultry, namely, high constitutional vigor, good size, and tremendous laying abiilty. Cockerels from this mating should be extremely valuable in grading up flocks of ordnary layers.—Charles D. Woods, Director Maine Experiment Station.

HENS LIKE VARIETY

In commercial egg production feeding is a prime factor—not the mere fact of feeding, but the kind, quality, amount, method, and regularity. It is not so much the kind of feed used as the elements included. Eggs are composed of water, protein, fat, and certain minerals in small portions. Water is the principal ingredient, protein next, and fat third.

In the feed, potein and fat must be provided in the right proportions. To supply these, and at the same time make the ration economical and give change enough to keep the hen's appetite robust, is the problem of the poultryman.

Corn, wheat, oats, and kafir are the four grains most commonly used. I would not feed any of them exclusively, and using all of them will be better than otherwise, but the relative price must be taken into consideration in deciding this. Wheat is too high now to feed profitably.

Oats the Most Valuable Grain

When estimating the cost of feed, it

must be considered that oats have only 20 pounds of actual grain to the bushel. Forty cents per bushel would be practically 2 cents per pound, and I would rather buy oats at 2 cents than any other grain. To my mind there is no better feed for chickens than oats, any if they are fed plentifully there will be less complaint of lack of fertility in the eggs.

No other grain will take the place of corn in my estimation, but if compelled to use but one grain I would use kafir, for it will come the nearest taking the place of the corn, and will supply the elements we get from the other grains in good proportions also.

I would not feed corn alone, either, for it is fat producing, and lacks in protein, leaving too much of the latter to be supplied from other sources. No grain ration will supply enough protein without an over supply of other elements.

Meat meal is the principal source of protein supply in the modern balanced ration. Alfalfa meal is also rich in protein. An economical ration provides 7 to 10 per cent of meat meal in the whole amount of feed consumed, including grain and mash.

Alfalfa meal in the mash will permit of some reduction in the meat meal. This mash should have a large percentage of bran, for bran is a good regulator for the hen's digestive system.

Nothing Better Than Skim Milk

Milk can almost or entirely take the place of meat meal if the hens can have all of it they will drink. There is nothing like milk to start active egg production and keep it up.

Provide a good supply of the beets and other roots for the hens during the winter when they can get no green forage. A few nails driven into the wall and a split mangel pressed back on each one with the face out will be all that is needed, and the hens will help themselves.

Beets are easy to keep and can be had from fall until spring. They should be buried or put in a cool cellar and covered to exclude the light and air some, or they will wither conideably.

Carrots and small potatoes are both good. Buy a load of mangels this fall for your hens if you have not raised them, and see if they do not repay you for them.

Green Food is Very Important

I would never go into the winter without a field of wheat or rye down where I could turn the flock on it conveniently in the fair weather during the winter, especially if I did not have a good blue grass pasture for them. Blue grass remains green so much of the winter it answers very well where one has it, but it is not so good as rye or wheat.

Where no other green in available during severe winter weather sprouted oats can be provided without much trouble. They are an especially healthful food when prepared in this way, and well worth the trouble, even if you have other greens too.

Red pepper and mustard are both relishes that help to keep up the appetite, but they must not be fed too heavily. Just a small amount in the mash or in a boiled feed once in a while. Celery tops, cabbage leaves, and anything of this kind will be welcomed by them.—L. H. Cobb.

PERFORMING AUTOPSY ON FOWLS

The poultryman should make it a general practice to examine all poultry that die from an apparently unknown cause. By so doing one is often able to determine the nature of the existing trouble. To make a post mortem examination on a bird, proceed as follows:

First remove the feathers from a large portion of the carcass; then with a knife separate the legs from their attachment to the body. In the next step the peritoneal cavity is opened. Ths is best accomplished with a pair of scissors, but a sharp knife will serve the purpose.

Start from a point in the posterior abdominal region and cut forward through the ribs on each side. This will free the posterior portion of the sternum or breast bone, and it can now be broken and laid back from the operator, allowing easy access to the thoracic and abdominal organs. The general appearance of the organs in their natural position should first be observed.

Of all the organs of domestic poultry the liver and intestines are most frequently involved in infectious diseases. The liver should always be removed and examined carefully; next examine the spleen (commonly known as the melt), which is a small, nearly spherical organ varying from one-half to one inch in diameter. This organ is often times involved in tuberculosis, but one is rarely able to discern abnormalities with the unaided eye in other diseases.

The intestines should be opened from the stomach to the anus, the intestinal contents washed out, and the mucous membrane examined for hemorrhages, diphtheritic membranes, inflammations and other changes.

Of the thoracic organs the heart usually shows the most striking lesions. Very rarely are the lungs involved in the specific infectious diseases. Even in tuberculosis the lungs are involved in comparatively few cases.

If the poultryman makes the post mortem examination of all birds that die a regular part of the routine of his business, he will soon be able to recognize any deviations from the normal, and act accordingly.—Dr. Robert Graham, Kentucky Station.

THE "OCEAN LIMITED"

Canadian Government Railways' Popular Train, Halifax and Montreal, May 15th

From its initial run, the "Ocean" won popular favor, has retained its friends, and is always making more. It will be welcome news to thousands of travellers that the "Ocean" is to be restored to its regular run on its regular schedule May 14th, from Montreal at 7.25 P.M. and daily except Saturday thereafter, arriving at Halifax 10.45 P.M. the following day; May 15th, from Halifax at 8.00 A.M., and daily except Sunday thereafter, arriving Montreal 8.05 A.M. the following day.

The timetable is so arranged as to permit daylight views of some of the most picturesque parts of Caanad—the Wentworth Valley, La Baie de Chaleur, the Matapedia Valley. And when you travel on the Ocean you travel on one of the best trains in America.

MAKING A HEN'S NEST

Next time you find a nest of eggs which a hen has stolen away, take a lesson in the proper architecture of such a structure. It may save a few broken eggs or a poor hatch the next time you proceed to set a hen in your own clumsy human fashion.

The keynote of the nest is flattened, shallow design. This is the way Nature has demanded it should be constructed to give the best results. How different from the deep, hollowed out contraption into which so many people pile the eggs they expect Biddy to transform into downy chicks.

A nest to prove satisfactory should be shallow enough to permit a hen to turn her eggs properly. It should be flat enough to permit the newly hatched chicks to lie where they are when released from the shell instead of sliding down into the bottom and having the eggs roll on top of them.—Orin Crooker.

SUCCESS WITH TURKEYS

Good two-year-old fowls are the best for mating. I always raise my hens so they will be acquainted with me and their surroundings, and then procure the male from some flock not related to mine. I have always set poultry hens on the first eggs and the turkeys on the second layings.

The young turkeys when about 24 hours old are placed in good pens with the mother hens, then given pure water, fine gravel, soaked bread dusted with black pepper, and hard-boiled eggs chopped fine.

For the yard I take three long boards about a foot wide and put the coop in one corner. This coop must be perfectly dry. As soon as the young ones are able to fly over the boards I let them roam around the yard and onion patch. Onions are their delight, and nothing is healthier for fowls of all kinds.

They should be fed a little whenever they come up, and good cold water kept out at all times. Charcoal is always before them with dust baths of wood ashes. Air-slacked lime is scattered in their coops. It absorbs dampness and keeps away lice.

After they are about two weeks old I feed corn and oats ground together, about equal parts of each. Too much corn meal is apt to make them gouty. For fattening in the fall I feed corn, oats, and rye.—Miss L. H.

SAVING DROWNED CHICKS

A heavy rainstorm coming up too quickly for me to get my chicks in left me dismayed, but not surprised, for the ground was level, with no way for the water to run off, to find lifeless chickens scattered all about.

A visiting friend declared the little chicks could be saved. This seemed impossible, as they were already stiff, but she insisted, so we gathered them up—a candy pail full. Under her direction, I filled several large pans with oats, heated them, and into these put the chickens, covering the pans with cloth and setting them on the stove and into the oven. This warmed the chickens thoroughly, and I lost only six.—I. G. Witt.

CAUSE OF SOFT-SHELLED EGGS

Soft-shelled eggs are common in the early spring. The first and usual cause is that the bird is too fat. In this case make the hens take more exercise by scratching in deep litter for their feed, which should be reduced somewhat. Also, feed sprouted oats or beets. Lack of lime will also cause it. This may be supplied by feeding crushed oyster shell or old plaster. Forcing the hens for heavy egg production and the excessive feeding of a loosening ratio will also bring about this condition.

If You Quit Talking

The circus had arrived. It was a straggly affair, singularly tame looking, in spite of its Wild West pretentions. In the parade were the usual bronchos, ridden by stolid, blanketed Indians and Mexicans in outrageously pink shirts and wide hats, cowboys and "cowgirls," and, lastly, a few squaws with their offspring suspended between poles attached to their ponies.

But it was a show, and there were horses. This latter fact proved the chief attraction to Ellis Pyke. Besides the bronchos, for which he cared little, were the great, dappled Percherons which hauled the few menagerie wagons the show boasted. For it carried a rusty elephant, a lion or two, and some mangy wolves as a complement of its woolly, but not noticeably wild, western exhibit. Ellis stood looking at the great horses after the parade was over, though most of his comrades were busily watching the tent go up in preparation for the afternoon's performance.

"Wanta job, kid?" grinned one of the men, noting the country boy's absorbed look.

"Would you give me one?" The answer was both incredulous and anxiously inquiring.

"Sure. We need about four lads your size. Any more of you at home?"

"I don't know as my folks would lemme go," answered the boy, hardly conscious of the last question.

"What'll you give us?" unexpectedly put in a third voice. Its owner was a boy Ellis knew, a harum-scarum lad about town.

"Sixteen a month and your keep," was the man's impressive reply.

Ellis gasped. He was only seventeen, and the sum named sounded big to his ears.

"What doing?" he asked eagerly. The man looked at Ellis sharply. His calling had made him a good judge of human nature. Country was written all over Ellis' broad, good-humored face, but there was more than the rural atmosphere about the boy.

"Like horses?" he asked briefly, confident of what the answer would be.

"You bet I do."

"Well, you can have the job of tending to these midgets," waving his hand toward the great draft horses, "and your pardner here will come in handy somewhere."

The bargain was made almost before the boys knew how it happened. The man had a persuading way, and the big Percherons made their own powerful plea to Ellis. Almost anything that promised excitement and change would lure Cromer Haight, so the business went through with a rush.

It was only after they had started home for their clothes that the question, "What'll pa and Ma say?" began to worry Ellis.

"Don't tell 'em till you're gone," advised Cromer. "Then you can write and tell 'em what a good job you got, and it'll save 'em a lot of worry."

It was specious reasoning, and carried the day. Ellis dreaded lengthy explanations and "fuss," so this seemed the easiest way out of it. For the first time in his life the country boy planned to take his destiny in his own hands, without consulting his parents.

It was not a difficult thing to do. The family had not returned from the afternoon's performance of the show, and the old clothes that the showman had assured him would be all he needed were easily procured. As far as that went, he could have taken them with all the family there to see, for Ellis was a boy that was trusted.

Not so Cromer Haight. He had kept his family in hot water from infancy. Toward evening of that eventful day, Father Haight began to look about for and telephone concerning his offspring.

Cromer was usually watched until the circuses were well out of town, but today, because of being in the reputed company of Ellis Pyke, this surveillance had lapsed a bit.

The boys were royally feasted and entertained with the best the show afforded that evening. There was a limitless supply of lemonade, and plenty to eat. Numerous bottles of stronger liquid circulated among the men, but none were offered the boys. The showman knew his business too well for that, but he thought it well to keep the boys near him and occupied until the show got out of town. Two of their men had just left because of unpaid wages, and they were decidedly short of help.

The boys were in the best of spirits. Circus life surpassed even their wildest expectations. Ellis had already made friends with the big Percherons, and the showman's beautiful, silky-haired dog had become his inseparable companion.

"Dog knows who to take to," laughed his master. "Never did take such a shine to me."

It was late when the show was over. Ellis walked sleepily beside the horses as they drew the gilded wagons to the string of waiting flat cars. He hardly noticed that Cromer disappeared soon after the show broke up. He was stumbling along, looking neither to the right or left, when two men suddenly appeared in front of him.

"Is that you, Ellis?" asked one of them, with a noticeable tremble in his voice.

Ellis looked up and saw his father.

"Will you come home without any fuss? Your mother is terribly worried."

"Why, you see—" began Ellis, astonished, when suddenly the light of a street lamp caught a policeman's star on the other man's coat. In an instant the boy's independent spirit flamed up.

"No, I won't," he said bluntly. "I got a good job, and I'm going to keep it."

The remark was half bravado, but the policeman had received previous instructions, and now stepped forward to do his duty as an officer of the law. He laid a detaining hand on Ellis's shoulder, with the significant remark: "I'll see that you get home safely."

Ellis flung off the touch as if it had been poison. With flaming cheeks he wrenched himself loose and ran madly toward the string of flat cars. To be arrested by a policeman! The country boy could fancy no keener disgrace. He ran widly, doubling, turning, twisting in and out of the tangle of circus paraphernalia until he had eluded his pursuers. He ran without any clear notion of where he was going, until the words "Your mother's terribly worried" flashed into his memory.

He had never before brought worry to his mother. Habit reasserted itself; he turned and ran homeward.

His frantic mother met him a block away, and, as is the way with some energetic natures, her terror and anxiety found an outlet in upbraidings somewhat out of proportion to the offense committed. She talked all the way home. Reproaches that stung his conscience and yet irritated him to the verge of madness by their endless repetition, fell in an incessant stream from her lips. He was dismayed and utterly nonplussed by his family's attitude toward the affair, and utterly unable to understand why it assumed such enormous proportions in their eyes. At first he tried to explain, but the effort fell flat when he caught a glimpse of his mother's tear-swollen eyes in the light of the corner arc lamp. He walked fast, in an unconscious effort to leave the stream of talk behind, but it caught up with and overflowed him.

He began to be conscious only of an overwhelming desire to get away by himself and think it out. It was impossible to think at all in that stream of talk. The lashing irritation of his mother's tears and reproaches vaguely reminded him of the swarms of mosquitoes that used to settle on him in the hazel thickets back East. The policeman was bad enough, but his mother's tears and reproaches were becoming intolerable, the more so because they could not be thrown off, like the policeman's touch. If only he could make her understand that he hadn't meant to worry her so!

His anxiety to reach home brought him almost running to his room door.

"You're trying to get away again," sobbed his mother. Frantic with new terror and anxiety, she hurried in after him and locked the door.

It was the last straw to the weight of indignities heaped on the proud soul of the boy. Choking with rage, he stood sullen and defiant before her.

"You can't keep me home by locking the door," he flamed out, "and if father ever brings a policeman after me again I'll—kill him!"

His mother shrank in horror from his rage-distorted face. Conscious of the need of some new tactics for this turn in the situation, she broke forth in entreaties, in lieu of reproaches.

"You've been such a good boy always," she said piteously, "and now—oh! what has come over you, Ellis? I know they've given you something to drink. You're not like yourself, you're—"

"Is there anything else you can accuse me of?" raged the boy.

The remnant of his self-control was fast leaving him. He felt suffocated with indignation.

"Get out!" he cried fiercely, yet with an undertone of appeal she would have done well to heed. "Don't you see I can't have you here? I—I wish I could swear!"

His mother shrank as from a blow, and fled wildly out of the room. In the hall she met her husband just coming in from a fruitless search for his son.

"Pa," she said, in a loud whisper that carried readily to the boy's ears, "he's here; but he's not himself. I know they've doped him."

With portentous solemnity Mr. Pyke walked into his son's room. He was of the substantial, middle-west variety of citizen, and he wore the look of one bent on doing his duty at any cost. He spoke with measured scorn: "To think," he said slowly, to let the words sink in, "to think I have a son who would want to run away with a low-down circus." With these words he walked majestically out. At a less tense moment he would have appeared ridiculous.

Mrs. Pyke went timidly in as her husband went out. Her heart ached with terrified apprehension. Her frightened eyes anxiously scrutinized the locks and the window fastenings, and searched for every possible loophole that might offer Ellis means of escape. Mechanically her nervous fingers turned the key back and forth in the lock of the inner door.

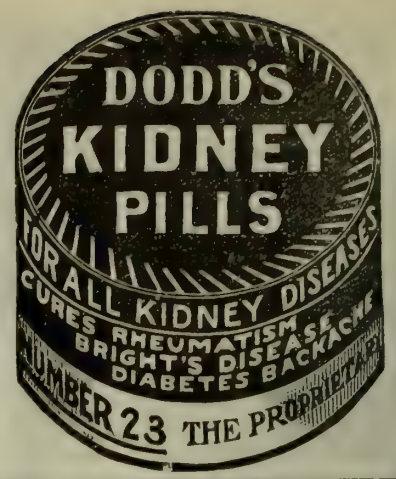
The boy's eyes were almost murderous as he watched her. He had been brought up to respect his mother, and he strove now to hold his peace.

She caught his look, and fresh terror assailed her. Impotently she fell back to her appeals and reproaches.

The veins in Ellis' neck began to swell. With a fierce gesture he ripped open his collar, and then, as if loosened from confinement somewhere in his throat, a torrent of cursing burst

BETTER THAN SPANKING

Spanking does not cure children of bedwetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.



HELP FOR WORKING WOMEN

Some Have to Keep on Until They Almost Drop. How Mrs. Conley Got Help.

Here is a letter from a woman who had to work, but was too weak and suffered too much to continue. How she regained health :—

Frankfort, Ky.—"I suffered so much with female weakness that I could not do my own work, had to hire it done. I heard so much about Lydia E. Pinkham's Vegetable Compound that I tried it. I took three bottles and I found it to be all you claim. Now I feel as well as ever I did and am able to do all my own work again. I recommend it to any woman suffering from female weakness. You may publish my letter if you wish."—Mrs. JAMES CONLEY, 516 St. Clair St., Frankfort, Ky.

No woman suffering from any form of female troubles should lose hope until she has given Lydia E. Pinkham's Vegetable Compound a fair trial.

This famous remedy, the medicinal ingredients of which are derived from native roots and herbs, has for forty years proved to be a most valuable tonic and invigorator of the female organism.

All women are invited to write to the Lydia E. Pinkham Medicine Co., Lynn, Mass., for special advice,—it will be confidential.

Use MILBURN'S LAXA-LIVER PILLS

FOR A SLUGGISH LIVER.

When the liver becomes sluggish it is an indication that the bowels are not working properly, and if they do not move regularly many complications are liable to set in.

Constipation, sick headache, bilious headache, jaundice, heartburn, water brash, catarrh of the stomach, etc., all come from a disordered liver.

Milburn's Laxa-Liver Pills stimulate the sluggish liver, clean the coated tongue, sweeten the obnoxious breath, clean away all waste and poisonous matter from the system, and prevent as well as cure all complaints arising from a liver which has become inactive.

Mrs. John V. Tanton, Birnam. Ont., writes: "I take great pleasure in writing you concerning the great value I have received by using your Milburn's Laxa-Liver Pills for a sluggish liver. When my liver got bad, I would have severe headaches, but after using a couple of vials, I am not bothered with them any more."

Milburn's Laxa-Liver Pills are 25c a vial, 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

from his lips. He remembered the oaths of the hired men on his father's farm, and used them with horrible proficiency.

His mother screamed and ran from the room. Never before had she heard Ellis swear. The little girls awoke and added their frightened weeping to the general confusion. In all that hysteria there was not one sane note.

Ellis listened in grim silence for a moment, then unbolted the outer door and flung himself out into the night.

"I'll go yet," he raged, with another oath. "I can't stand it here another moment."

Just then Miss Rossiter came around the corner of he house. She was their "roomer," and Ellis recalled her existence with a distinct shock. No doubt she had come to deliver her lecture now. He felt a new sense of desperation. Of course, she had heard the whole of the miserable fracas. She had always been a good sort, a comrade and friend interested in his rabbits and banty chickens. It was hard to have this new ordeal forced on him after all the madness he had just gone through. He wheeled sharply, intending to go out by the back gate and thus escape it, when a quiet voice, wherein was no trace of excitement, halted him.

"Is this your little dog?" the voice inquired tranquilly.

A sane note at last! Ellis felt a vast relief and an immediate response to that note. The effect of her words was as instant as a pail of cold water on a drunken man. He stared at the little silken-haired dog for a second, and sanity and reasonableness returned in a breath.

"Why, it's the little circus dog! He must have followed me home. Where did you find him?"

There was a note of confusion in the last sentence, but Miss Rossiter did not seem to notice.

"Isn't he a beauty?" she asked, stroking his black coat. "Don't you think we ought to fix him a bed somewhere?"

Ellis eagerly assented. Action was the one thing needed. He could work off what he now had no desire to swear off.

Miss Rossiter became conscious of an anxious white face watching them from Ellis's bedroom window. She shook her head warningly while Ellis's back was turned, and went on helping to put the circus dog to bed, chatting cheerfully over the task.

To talk on any but the subject was vast relief to Ellis. There was an undercurrent of gratitude toward Miss Rossiter in all he said.

"This moonlight night is swell, isn't it?" he asked, in an eager effort to express his relief in some way. Miss Rossiter assented enthusiastically.

The box that Ellis brought was fitted up with the piece of old carpet that Miss Rossiter found, and the little circus dog crept wearily and gratefully into his bed. Ellis reached in and pulled his silky ears. The little creature licked his hand affectionately.

"How he loves you!" exclaimed Miss Rossiter.

Ellis experienced a sense of gratitude and humility. It was a little hard to understand how even a circus dog could love him, after the horrible outbreak of the past hour.

"Well, I think he's comfortable now," said Miss Rossiter, turning away, "and we'd best turn in, too. You get up early, don't you? You'll need your sleep. It's near two o'clock, I judge."

"Two o'clock!" Ellis started guiltily. She had been kept up, too; and his mother—. Her white face recurred to him now, with a stab of remorse. He walked silently in the direction of his room door.

"You'll keep the dog, Ellis?" interrogated Miss Rossiter.

Ellis nodded. "The circus is gone now," he explained briefly.

"He'll be a good friend to you. A dog is very loyal."

"You bet he is," enthusiastically assented Ellis.

"And, Ellis"—Miss Rossiter paused a moment as their ways separated—"a show that even a dog runs away from is pretty rotten, don't you think?"

"Yes, I do," answered Ellis. And Miss Rossiter said nothing more at all.

Her progress up the stairway was arrested by the sight of a white face in the hall.

"Will—will he stay?" appealingly inquired Mrs. Pyke.

Miss Rossiter paused a moment, moved with pity for the overwrought mother heart; but there was something to be said, and she must not shrink from the task.

"He will stay if you quit talking."

She leaned over the banister and turned down the light. The balm of darkness descended on the troubled household.

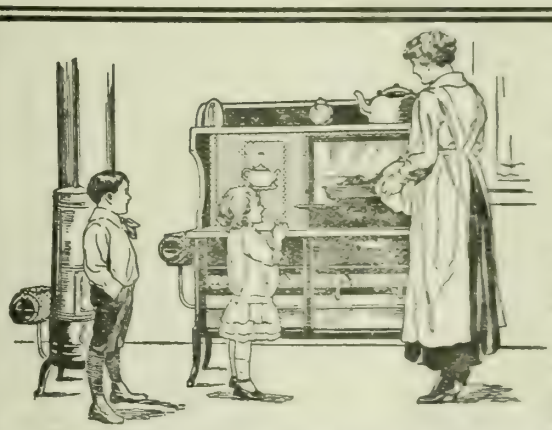
PROTECTION FOR TOMATO PLANTS

We set plants in the garden as early as possible, and if a cold spell follows we cover them with glass fruit jars, which protects them from frost and chilling winds. Let the cans remain until the weather warms up, but keep a sharp watch on warm days, for there is danger of scalding the plants. Quite often we take the cans off in the morning on warm days, and put them on again at night.

We break our ground in the fall, loosen it up well in the spring, and set the plants three feet apart. Give a liberal dressing of chicken manure around the plants. We train each plant to a stake, and break out most of the suckers, which hastens the growth of the fruit.—Rosetta McGregor.



The "Florence Kitchen"

Makes the happy family. McClary's Florence Blue Flame Oil Stoves simplify your cooking. Easy to use, clean, safe, economical, and reliable—an ornament to any kitchen.

McClary's FLORENCE

OIL COOK STOVES

Wickless, Valveless, Blue Flame, Automatic

No hot summer kitchens. The Florence is ALWAYS ready with AS MUCH heat as you want, right WHERE you want it—IN the cooking, and NOT out in the room. Costs less than a cent an hour per burner.

You can keep one—or four—burners at an intensely hot flame, or merely simmering. To regulate the heat, you simply turn the lever according to the dial.

There are no wicks to trim, nor valves to leak. The oil supply is automatically constant. All Florence stoves and ovens are fully guaranteed.

Ask your dealer to show you the Florence. If he cannot supply it write to our nearest branch.

PERSONAL HYGIENE

Hygiene is that department of sanitary science which treats of the preservation of health of the household and community. By personal hygiene I refer to rules for the promotion of individual health. It is the art of keeping the body clean and sanitary. A well-washed face and hands free from grime have an aesthetic value, but cleansing our exposed parts has little effect upon health, if we swathe our bodies in filthy underclothing and allow the skin pores to become clogged with a mixture of dust, lint from the garments, and oily matter from the sebaceous glands. The skin is filled with thousands of small openings or pores from which comes an oily secretion. If this is allowed to accumulate the ends of these pores stop up and the skin becomes coarse and pitted or rough.

Transpiration of the skin is no less important than the process of breathing, or keeping the bowels active. Each of these functions carries waste out of the body. The skin excretions are just as important as the kidney secretions. Do not confuse this oily matter of the skin with sweating. It is entirely different. Perspiration assists in lowering body temperature during exercise. It is a cooling process. If the sweat washes away, as it may, the oily waste from the pores, it is well and good; but if we are to depend upon this means of keeping the body clean we must sweat more and change the underclothing frequently. Even at best it would be a poor makeshift for a daily bath.

The Bath Is Coming

Bathing in some country homes is difficult because of lack of facilities. Bathrooms are not yet to be found in every farm home. But the bath is coming! Not because the country is aping the city, but because country people are learning that much bathing is necessary to good health and the pursuit of happiness. They are learning that by right living they can keep the doctor away. The day is not far distant when laws will control sewage disposal on the farms as they do now in towns and cities, and with this change will come better arrangements for bathing. Nothing is more offensive than a sweaty, unclean body.

The "old swimmin' hole," with all its terror for loving mothers, is a blessing in disguise. And shortsighted indeed is the parent who does not encourage, and in absence of something better, does not personally lead his promising brood to the "deep hole down in the meadow" during the harvest twilight for a refreshing dip, or "a dive to bring up gravel."

Toilet articles should be individual. There is no justification for a common towel. It is a great menace to health and a more likely distributor of germs than the common drinking cup. Each member of the family should have his or her own things for the toilet, and use them daily. Never retire for the night without the body being prepared for the recuperation of the night's rest. After a hard day in the dust and dirt a half hour of face washing, tooth brushing, and throat gargling, with a bath and a rub with a coarse towel, and a change from the sweaty work clothes to a clean sleeping garment, would add more in physical vigor, good health and contentment of mind than any other change that could be made in country living.

For cartarrh of the head, the nose should receive daily attention. The nasal douche is suitable for home use. Use a mild alkaline solution, pouring or snuffing it up the nose.

Care of the teeth is very important. Decay is hastened by decomposition of food which has lodged between them. This affords a suitable place for the growth of many kinds of germs. If you will run your tongue around your teeth you may feel a rough scurf covering them. This roughness is a deposit from the saliva, in which are growing untold numbers of microbes. How offensive is the breath from an unclean mouth with decayed teeth! And what wonder that we suffer from indigestion and stomach trouble, when food, thoroughly mixed with these germs, passes from such a mouth into the stomach! Cleanse the teeth frequently with a brush and tooth paste or wash. This will arrest decay, and by keeping the decayed places filled will postpone the day of "store teeth." Good teeth that can grind the food will assist digestion and do much to preserve a well-nourished body.

To civilized man the mouth is most sacred. By it we measure our ideals of cleanliness, and each one of us regards our own mouth as being clean. Yet many a one uses his mouth as a third hand, and will hold in it such things as pencils, strings, nails, gloves and even money—in fact, any and everything goes into the mouth. It is a common receptacle, a catch-all, and a convenience. Can you imagine a more desirable way to infect your system than by placing these germ-carrying things in the mouth? And because of this common receptable use, our mouths become a source of danger both to ourselves and to the community, by contaminating things which others handle, and in turn hold in their own mouths.

Although the mouth is the entrance for sustenance into the body, it is also a means of exit for coughing and spitting. Spitting is inexcusable. It is a habit for which there is no defense. It is an insult to society, an imposition upon your fellow man, to expectorate along the streets and highways, where it is impossible to avoid contamination. Laws can do much to correct this habit, but the great good must come through the education of the young. Teach the girls and boys to NOT SPIT!

Cleanliness Next to Godliness

The use of chewing tobacco, which is a mouth habit, can easily become disgusting and dangerous. Since tobacco juice must be gotten rid of, it requires spitting, and spitting for any purpose cannot be reckoned as a refinement. Perhaps tobacco chewing could be accomplished in a pleasing, sanitary manner—but why chew at all? Other than poison the body, what does it accomplish?

Uncouth habits are hard to get rid of. Culture does not necessarily accompany cleanliness. It matters little whether you eat mashed potatoes with your knife or fork, so long as you do not eat like a "swine herd." Tin plates can be kept just as clean as Haviland china. To be cleanly does not require that you be a fop.

Personal hygiene is important since it is the basis of our aesthetic tastes. Upon these ideals we build our habits. If by precept and early training our personal habits are filthy, so will be our home surroundings throughout life. If the father "kept the pig in the parlor," why should not the son do so, too? If mother taught her daughter to keep herself tidy and to bathe daily, most surely will that girl teach her own daughter to do these things. So then we turn to the young people, to the girls and the boys in the schools, in an appeal for better living and better training in how to live; for more healthful habits and better care of the young bodies; for better personal hygiene.

"Just as the twig is bent the tree inclines," and so too will youth-formed habits of personal cleanliness cling to us until we are robbed of our reason by a second childhood.—Dr. Julian Clarge, in Exchange.

THE ART OF SEASONING AND FLAVORING

To know how to properly season and flavor the various dishes cooked is an art, and one that is learned almost wholly from experience, practice, and experimenting. Even in the use of such common things as salt and pepper one must learn from experience the proper amount to use or the food will not be edible.

The object of seasoning and flavoring our food is to give it a pleasant taste. We are so constituted that we cannot enjoy anything if it is used in excess. So the wise cook uses only just enough seasoning or flavoring to make one long for more.

Every herb as well as flavoring has a definite place in cookery. This makes it possible to season the various dishes prepared so they will not all taste alike.

The home-grown herbs are better than those bought in cans. So if at all possible, grow your own herbs.

Sage is commonly used in seasoning dressings and sausage, but if a leaf or two is minced fine and sprinkled over the roast pork it will give a new flavor to it which is a pleasant change. Sage should never be used in dressing that is to go in a baked fish or oyster dressing, as it kills the flavor. A tiny bit of Marjoram and basil or savory, thyme and balm can be added to the dressing for fish instead of sage. Sage is also used with goose and duck, as these are among the heavy meats.

The Trophy-Winning Shot Shell

must be a load that is fast, hard-hitting and reliable under all conditions. Careful selection of materials, perfect balance of powder and shot and intensive inspection combine to make

Canuck

the best of all trap loads. It's speed and powerful impact have gained for it an enviable reputation as the "trophy-winner" at the traps. Crown, Sovereign, Regal and Imperial are other popular Dominion smokeless trap loads.

The Maritime Provinces

Summer Tourist Travel

The United States railway authorities are expecting a big tourist travel to New England resorts this year, and advance many reasons for their optimism in this respect. They cite the facts that war conditions have closed the door to European resorts, that the San Francisco Exposition, which last year led thousands to spend their vacation on the Pacific Coast, is over, and that the extraordinary prosperity in the United States has provided many people with ready money for extended trips. Another indication is the large number of requests received for summer literature. The numerous inquiries received by the Canadian Government Railways is a sure index that great interest is being taken in the summer resorts of the Maritime Provinces, and all its principal passenger representatives in the United States and Canada have been provided with a large supply of 1916 descriptive literature.

With the unlimited possibilities that Maritime Canada possesses for summer enjoyment—conditions as enjoyable as those in the most favored part of the world that may be chosen for comparison—sunny skies, delightful temperature, invigorating air, an endless variety of picturesque beauty—nature evidently intended the "provinces by the sea" to be a land for recreation.

The value of summer tourist business to the New England states is estimated in the millions. Now is the time for our Maritime people having accommodation for summer visitors to put their houses in order advertise the fact at home and abroad, welcome the stranger, and reap the golden harvest.

The fresh leaves of Marjoram and basil or savory, thyme and balm can be minced and sprinkled over a planked or broiled fish, or they can be chopped fine and added to eggs for an omelet.

"Sweet herbs" include sage, balm, Marjoram, basil, summer-savory, chervil, and thyme.

Our grandmothers knew the secrets and just how to use the various herbs. They can give many suggestions that are not found in all the newer cook books. Grandmothers often speak of a "bouquet of herbs" for this or that purpose. These are usually made of Marjoram and basil, which have a clover-like flavor. Savory, thyme, and balm are similar in flavor. They used these largely in pot-roasting and in baking fish. The bouquet is lifted out along with the meat, but is never brought to the table or left in the pot while the gravy is made.

Often a "bouquet" of herbs is added to the soup kettle. In this way the flavor is imparted to the stock, and the herbs are not scattered through it.

To make the bouquet, simply tie the desired amount of herbs together firmly with a sting, so they will not come apart in the pan or kettle in which they are placed.

While sage is best suited to heavy meats such as pork, sausage, goose, and duck, it is also used in the more delicate meats as chicken, turkey, etc. For a change, substitute Marjoram, savory, and thyme, as they are more delicate in flavor and go well with these meats.

The salar herbs are parsley, chives, chervil, burnet, and tarragon. Chives have a mild flavor of onion, chervil a pleasant pungent taste, burnet the flavor of cucumber, and tarragon of vinegar. Parsley is an old-time favorite, and its use is well known to almost every one.

Chives are also useful in making fillings for sandwiches, or they can be minced and sprinkled over a steak or roast beef, or in a stew, or in the gravy, or with the yolks of stuffed eggs.

Horse radish goes especially well with beef. In the spring the young tender leaves are used for greens. In the fall the roots are at their best and they can be dug and grated and packed down for winter use. To every pint of vinegar add a tablespoon of sugar and one teaspoon of salt. Pack the grated horse radish in wide-mouthed bottles and cover with vinegar.

Often it takes only a tiny bit of grated onion to give a new taste to the soup stock, or gravy, or a stew. Celery seeds are a delightful addition to braised meats and fowls. A sprinkle of paprika over the dish of mashed potatoes makes a pleasant change from black pepper. The paprika is a sweet pepper, so that one need not be afraid of it.

Vanilla is the standby in flavorings. A few drops will improve the chocolate cake or icing, or the straight chocolate when made into a drink. Nut cake an bread are improved with a few drops of vanilla. One can also add a little grated nutmeg with it to nut-loaf cake.

Vanilla and almond go well together. The cake can be flavored with one and the icing with the other. It is all learned by experimenting with first one and then the other until one has fully learned the art of seasoning and flavoring.

A friend who had to be economical told of a very inexpensive cake recipe she used in making nearly all of her cakes, but she never used the same flavoring twice in succession. That was the reason her family did not tire of it.

One will make some mistakes in carrying out these experiments, but on the other hand, many combinations will be found that are so delicious that the mistakes are looked upon as a blessing in disguise. Do not be afraid to try new things.—Margaret Palmer.

A COUNTRY BRIDE'S CLOTHES

A pretty country girl with a rich father was getting ready to marry a young man who had not much money. They were going to start for themselves on a rented farm. The girl was used to the very best clother money could buy, and every one expected to see something very stylish and expensive when her wedding clothes were worn. But she amazed them all by choosing an inexpensive outfit that might have been worn by a bride with one-tenth her possessions.

Her wedding dress was a pretty white one that could be used for best in summer two seasons She was not going to take a wedding journey, as the young farmer could not afford it, but her "going away gown" from the old home to the new was a blue jacket suit bought to last for spring and fall for at least two seasons. Her hat, gloves, shoes, and all accessories were dainty and new and pretty, but they were not extreme. Her undergarments were sensibly made and trimmed, and she had not too great supply of them.

In house clothes she had a good supply, and all the materials were of the best. Her pretty percale dresses were as daintily made as for best, and the aprons were of the very best and prettiest material and style to be found. Shirtwaists, dressing jackets, a warm and a thin kimono, dusting caps, afternoon blouses, and all were pretty, sensible, and likely to last a long time and hold their color. A warm sweater, several scarfs, handkerchiefs, and all the things a country woman needs were in the collection, as well as the dainty bits of neckwear and fancy aprons young women wear at home and at socials.

All her old clothes had been furbished up and cleaned, so that they would do for second best, and of course such articles as furs, bits of jewelry, slippers, and other gifts from home were taken with her. Aside from the natty suit and wedding dress, she had but two other dresses that were new. One of hese was a pretty soft silk, made so that it could be used with high or round neck, as occasion demanded, and the other was a serviceable cloth skirt with several shirtwaists, one white and the other a silk to match.

I could not but think of another bride who married a young tenant two or three years ago, after a "big" wedding that her father could ill afford. She was dressed in white silk for the ceremony, and went away on a short journey in an expensive suit. Her outfit consisted of underwear heavily trimmed with expensive laces and embroideries, flimsy silks, extreme styles in gloves, millinery, and shoes, and five perfectly useless dresses that were out of style in a year.

For a city bride who was to entertain and visit much the outfit would have had its good points, but for a farm tenant's wife it was out of place entirely. She needed a raincoat, a sweater, a sufficient supply of house dresses, a warm hood and scarf for driving, a heavy blanket or bathrobe for wear in a cold house in emergencies, a kimono, a knit shawl, a pair of warm slippers, and a dozen and one other essentials for which there was no money when the stylish dresses and hats and shoes were paid for. The price of the "big" wedding and the useless clothes would have supplied her with everything needed, and left a nice little nest egg for emergencies. But she could not see it that way. As the dresses were made in the scanty style of several years ago, they are now worthless, of course.

So I feel reasonably sure that the girl with the plain, almost scanty, outfit will enjoy wearing her things more than the other bride, and will keep healthier and more content while doing so.—Hilda Richmond, Ohio.

HOT THINGS FOR SUPPER

Alice Smith and her mother were talking about rice when a friend came in who had once travelled in far Japan.

"It's no wonder Canadians don't care for rice. They so seldom cook it in any way but the soaky pudding way, add an egg or two, and think it's perfect," the visitor remarked.

"Well, tell us how they cook it in Japan," Alice exclaimed.

"Why," said their visitor, "I shall be glad to tell you. It's very simple, too."

"I'll just get my own Cook Book and pencil, and write down what you tell me, so wait a minute," said Alice.

So she did, and the three settled down to talk "rice," and this is what Alice wrote in her cook book. You remember her recipes had numbered up to 24, so next she put down:

25. Japanese Rice.—Use boiling salted water, and pour it over the rice, using only enough to keep it from burning. Cover tightly, and let the pot sit in a moderately hot place for about ten minutes. If it seems to stick, shake it, do not stir. When nearly done, remove cover to allow the moisture to escape. You will find the rice has separate kernels.

Rice contains so much starch that it spoils it to overcook it. It soaks up moisture just as soon as it is done. You know how careful you are to drain your potatoes just the minute they are oft enough to push a fork in easily. You know you do this because experience has taught you that longer cooking will make the potatoes soggy. Well, it's just the same with rice. Be very careful to drain the water off when the kernels are soft.

26. Rice Boiled in Water.—Take a very large kettle of boiling salted water. You should have about four times the water you have of rice. Drop the rice in and let it boil, uncovered, for fifteen to twenty minutes. Keep testing it, and as soon as the kernels are soft pour into a colander to drain all the water off, shake, and let steam a few minutes on the back of the stove.

Rice cooked in either way, 25 or 26, will be enjoyable as a vegetable. Use instead of potatoes with meat, gravy, etc.

Had Dyspepsia.

Says: HE NEARLY TURNED UP HIS TOES.

Burdock Blood Bitters CURED HIM.

Mr. H. N. Manderson, Stettler, Alta., writes: "About twenty-five years ago, in the Province of Quebec, I came pretty near turning up my toes with dyspepsia. A cousin of mine persuaded me to try Burdock Blood Bitters. In about two weeks I could eat anything from raw fat pork to unleavened bread. Three bottles did the job, and I have never been troubled with my stomach since. You would say that this is wonderful if you could only see what we sometimes have to live on in this country; bannock, half cooked beans, etc."

Burdock Blood Bitters has been on the market for the past forty years, and cannot be excelled as a medicine for all diseases or disorders of the stomach.

B.B.B. is manufactured only by The T Milburn Co., Limited, Toronto, Ont.

CARE OF HOUSE PLANTS

By Margaret Palmer

In order to receive the best results from a variety of potted or house plants, each plant must receive the right amount of light, water, soil, and the care suited best to that particular specimen.

Potted plants should be examined every spring and fall to see whether or not the plant requires re-potting. This is done by holding one hand over the top of the pot and tapping the edge of the pot with the other hand. If the earth around the plant is moistened, this tapping will loosen the plant from the side of the pot, and it is then easily slipped off.

If the earthy ball is found completely covered with roots, the plants need re-potting at once. Sometimes the plants need to be re-potted into a larger size as soon as its present pot gets full of roots, but no sooner. The growth will be much quicker if a pot a size larger is used each time, as from a 3-inch pot to a 5-inch pot, or from a 5-inch pot to a 7-inch pot, and so on.

The roots of many plants lie dormant during the winter months, and should not be disturbed during this period, which is one reason for re-potting in the spring.

The earth used for house plants should be prepared from one spring to another. This is done by using one part compost (cow or sheep manure), one part rich loam (good turf), and one part sand. This is mixed together in the spring and allowed to rot until the next spring. It should be stirred two or three times during the summer.

Good decomposed leaf mould is a very good substitute to use in place of the compost where one has no earth prepraed ahead.

One of the great enemies of house plants is coal gas. The slightest trace of the gas will retard the growth of new leaves.

Nothing will brighten and freshen up house plants like a bath. The water removes the dust and opens up the pores. This can be done at least once a month. Place as many plants as possible, without crowding, in a wash tub. Then use a small sprinkling can or a whisk broom to do the washing. A soft, dampened sponge may be used to wash the dust off of leaves on which it seems to stick or that the sprinkling will not remove. Use water that has the chill removed. The temperature should be about the same as that of rainwater in summer.

Some plants need watering every day, while others require water only every two days. If the leaves turn yellow and drop off, it is a pretty safe indication that the plant has been watered too much.

No rule can be given for watering plants. My own I always water from the top and not any more than what the plant and earth will absorb each time. If the water is poured into the saucer or the jardiniere in which the plant sits, it is apt to cut off the roots' supply of air, which is injurious to any plant, as it must have air as well as water, sunshine, light, and the right temperature.

Keep a vessel of water on the stove or register to supply moisture.

Geraniums are, perhaps, the best known and, on the whole, the easiest to keep of the various varieties of house plants. Give them as much sunshine as possible, for they will bloom in winter when all other flowers fail.

Ferns, palms, rubber, and cacti plants require special care and handling. The same is true of begonias, fuchias, ivy, umbrella plants, etc.

Ferns require a strong light to do their best, but will grow fairly well with only a little sunlight. As we think of ferns growing in the woods, we are apt to think they require no sunlight, but it is not so with the different types which come from the florists. They are raised for indoor culture, and must receive sunlight and just enough water to keep them moist. If they are kept too wet, or allowed to go bone dry a few times, it will be the ruination of the fern, for they cannot thrive under such conditions.

Hanging baskets and window boxes require a window with plenty of light and sunshine.

All dead and withered leaves should be removed from the plants at once, as well as blossoms.

If the plants should get frosted during the night, as soon as the discovery has been made remove them to a dark room where the temperature is just above freezing. Sprinkle a heavy shower with very cold water. In many cases this will save the plants where they have not been allowed to thaw. Many of the tender plants have been saved in this way.

The frost must be extracted gradually, allowing no heat near them, keeping them away from light and warmth for three or four days. If the tops wilt

Calls Them One of Her Best Friends

DAME BELANGER TALKS OF DODD'S KIDNEY PILLS

Tells How They Cured Her Rheumatism and Made Her so Well She Could Work Wihout Fatigue.

St. Amateur, Gloucester Co., N. B.—June 8th (Special).—Cured of rheumatism, from which she had been a severe sufferer, Dame Pierre Belanger, well known and highly respected here, is telling her friends that Dodd's Kidney Pills have made her well.

"I consider Dodd's Kidney Pills one of the best friends I have," Dame Belanger states. "I had rheumatism and the pains in my limbs caused me a great deal of suffering.

"I took six boxes of Dodd's Kidney Pills, and they made me well. My pains are all gone, and I can now work without being fatigued. I will always keep Dodd's Kidney Pills in the house."

Dodd's Kidney Pills cure rheumatism because it is caused by sick kidneys. Rheumatism is caused by uric acid in the blood. If the kidneys are healthy and doing their full work they strain all the uric acid out of the blood, and there can be no rheumatism. Dodd's Kidney Pills always make the kidneys well. They take away that tired feeling by ensuring pure blood and good circulation.

"Good News for Farm Women"

Orange, N. J., March 1, 1916

Dear Mrs. Dairywoman:—

The bearer of good news is always welcome; and I have some very good news for farm women. We've a new separator at our house and it's a wonder.

One splendid feature of this new invention which must have been planned with the comfort of the dairy woman in mind is the knee-high supply can. This does away with the hard, high lift no woman should be asked to endure day after day. It's only a few inches to lift and a tilt of the pail, even for a small boy. This is *one* item of good news.

Cleanliness is the beginning, middle, and end of good dairy work. You know how quickly the separator shows the effect of any slight letting up in this direction. With dishes to wash three times a day, cooking utensils, calf pails, milk pails, etc., a big pile of separator disks is just about the "last straw", isn't it? But with our new Sharples there are only three pieces to clean, not one heavy, bulky, or fussy. This is the *second* piece of good news.

Formerly, a slight slowing of speed in turning the handle of the separator meant a loss of cream—and money. One's attention had to be strictly on turning the crank at an unvarying high speed, which was trying to both mind and strength. My *third* and best piece of good news is that

THE NEW SHARPLES SUCTION-FEED

Separator draws up into the bowl just the right amount of milk—always in proportion to the separating force. If you feel out of sorts, you may turn slowly and the bowl will drink up just enough milk for clean skimming and no more. If you feel spry and want to get through to sew, to trim a hat, or to visit a neighbor, turn as fast as you please and the bowl will take up proportionally more milk, yet the cream will be of the same thickness. Smooth, even cream, such as the Suction-feed gives you makes quality butter that brings top prices.

The separator has only one thing to do while you have many tasks. The separator has always been a tyrant which insisted on being turned at regulation speed, whether you were well or ill, worried or happy, rested or worn out. But this new Suction-feed Separator ***meets your moods.*** Its speed is your speed and yet, it ***gets all the cream all the time.***

Why don't you drop a postal to the Sharples people for their new book? Then, you can show your husband that this new invention will be a money saver for him as well as a labor saver for you.

Yours truly,

A Dairywoman

What this farm woman says in her letter is absolutely true. There are many other pieces of good news in our new book, "Velvet" for Dairymen, which fully describes this wonderful separator. Send for your copy today. Address Dept. 79

The bowl is easy to wash. There are only three parts, and *no disks.*

The Sharples Separator Co.

Toronto - - - - Canada

after the frost has been extracted, that portion of the plant is beyond saving, and should be removed. Cut below the part affected, so that there will be no danger of decay setting in and ruining the remainder of the plant. If the whole plant wilts, cut down, and in many cases new shoots will start. This is well worth the trial when a favorite plant has been nipped.

A good protection for plants where there is danger of frost is to protect them with newspapers. Remove them from the windows to a box lined with newspapers, set a lantern inside, and cover the top with newspapers, leaving a small air hole so there will be no danger from fire.

In very cold weather, water the plants sparingly, and in the morning.

GRANDMOTHER'S ALPHABET

Always be cheerful and patient as well as industrious.

Brooms hanging instead of standnig will keep them soft and pliant.

Canning—do in early part of the season and early part of the day to save fruit and temper.

Dish of hot water set in oven prevents cakes from scorching.

Economize time and health and means, and you will never beg.

Flour—keep cool and dry and securely covered.

Glass—clean with a quart of water mixed with a teaspoonful of ammonia.

Happiness is not so much in doing what you want to, but in wanting to do what you have to.

Ink stains—wet with spirits of turpentine; after three hours, rub well.

Jars —tokeep cereals in good condition, always put in glass jars. To prevent jars in the family, always bring a smiling face to the breakfast table.

Keep an account of all supplies, with cost and date of purchase.

Love lightens labor.

Money—count carefully when and where you receive change.

Nutmegs—prick with a pin, and if good oil will run out.

Orange and lemon peel—dry, pulverize, and keep in corked bottles to use for flavoring.

Parsimony—be careful lest what you call prudence and economy is really this.

Quicksilver and white of egg destroy cockroaches and bugs.

Rise in the morning full of gratitude for the new day.

Sunshine within and without is the best medicine.

Try again, and conquer all obstacles.

Undue haste makes waste.

Vinegar never catches flies, but honey does.

Wholesome advice is easy to give and hard to take.

Xantippe is not a character to emulate.

Zest is the secret of success.

A SIMPLE TRUTH

Marvin L. Piper

Loog for flowers only
All along the way,
And you will surely find them
Every passing day.

Look for weeds and briers,
And you will find them, too,
All along your pathway
'Neath the ether blue.

'Tis a truth most simple—
Just bear it in mind;
Whatever you may look for
You will surely find.

KITCHEN KINKS

The rubber rollers of a clothes wringer can be cleaned with kerosene; then rinse off with warm water.

Matting should be cleaned with a cloth dampened in salt water.

Fabrics colored with analine dyes that have faded may be restored by sponging with chloroform.

THE right kind of flour makes the right kind of Bread.

With REGAL FLOUR you not only get quality, but you get quantity as well.

THE ST. LAWRENCE FLOUR MILLS COMPANY, LIMITED
MONTREAL

Production and Thrift

CANADA'S CALL FOR SERVICE AT HOME

Produce More and Save More

The Empire needs food. If you are not in the fighting line you may be in the producing line. Labour is limited—all the more reason to do more than ever before. Grow food for the men who are fighting for you. The Allies need all the food that you can produce. Every little helps. You are responsible for your own work. If you cannot produce as much as you would like, produce all you can. Work with the right spirit. Put fighting energy into your effort and produce now when it counts. The more you produce the more you can save. Producing and saving are war-service.

Make Your Labour Efficient

In war-time do not waste time and energy on unimportant and unprofitable work. Economize labour. Put off unproductive work till after the war, and, if possible, help in producing something needed now. Let us not waste labour. Canada needs it all. If possible help to feed the Allies. Make your backyard a productive garden. Cultivate it with a will. Make your labour count for as much as possible.

Do Not Waste Materials

There should be no waste in war-time. Canada could pay the annual interest on her war expenditure out of what we waste on our farms, in our factories, in our homes. Every pound of food saved from waste is as good as a pound of increased production. The way for a nation to save is for every individual to save. France is strong to-day because of thrift in time of peace. The men and women of Great Britain are not only "doing" but are learning to "do without."

Spend Your Money Wisely

Practise economy in the home by eliminating luxuries. Wasting our dollars here weakens our strength at the Front. Your savings will help Canada to finance the war. Save your money for the next Dominion War issue. There can be no better investment.

REDUCING FOAL MORTALITY TO A MINIMUM

(Continued from page 559)

is required to loosen attachment. If not born within three hours, death will result. As soon as foal is delivered the sheet covering it should be broken, if not broken previously, and the foal left to itself for a few minutes to rupture the navel cord. This is a natural process of nature, and the escape of blood and other liquids from it will be more certain that if a ligature were at once applied. Many cases of pyemia or joint ill, follow days after navel cord has apparently dried up. This is due to imprisoned material which is absorbed and carried through the system, from which septic infection follows. On this point pages are written and science is taxed. It is well to remember that a qualified veterinarian is required to deal with the separate serious conditions as they arise. If cord does not rupture of itself, it can be severed by holding one hand close to the white line, one inch from colt's body, to remove any likelihood of strain between your hand and the foal, and draw cord off with other hand. Should this fail, apply a ligature of strong white cord and sever with knife one-half inch below ligature. See that ligature is clean and made antiseptic by creolin or other good equivalent, and have it on hand ready for the occasion. The navel cord should have a good antiseptic applied three times a day until healing is complete. This antiseptic should be of such a nature that it will not irritate and cause the foal to bite or otherwise bruise the navel, such as tincture of iodine or strong solution of formaldehyde. If after some days navel is discharging or moist, a powder of equal parts of pulverized alum, iodoform, and boracic acid may be applied three times a day.

Treatment of the Foal

As soon as foal is able to stand, it should be assisted to nurse, and if not strong enough should be fed the mother's milk combined with one ounce of whiskey or an occasional fresh egg, or both, to which may be added a teaspoonful of brown sugar as a laxative. Delicate foals are those from which the meconium or first feces does not readily pass. This should be carefully watched; otherwise pain and colic will soon manifest itself. In cases of constipation, relief may be found in administering injections of warm water frequently, and three or four ounces of raw linseed oil, or castor oil.

Mares that are heavy milkers and not at work will generally have strong colostrum or first milk, which may produce diarrhoea or indigestion. In such cases the foal should not be allowed to get an overfeed, which may be guarded by milking the mare for a few days. In order to insure a good supply of milk for the foal, see that the mare has plenty of good, clean, warm water to drink for at least three days after foaling. Good hay, boiled oats, and bran should be fed, always being sure not to overfeed. As soon as possible, allow both mare and foal outdoor exercise so long as ground is not damp for colt to lie on. If the mare has to work steadily after foaling, see that foal gets a nurse at least every two and a half hours, but see that the mare is not too warm.

WHEN THE FIRE CRY CAME

By Allen Wylie

You've heard the cry of "Fire!" come across the fields during some storm? What did you do first of all? You looked to see where the fire was—and you instinctively turned to your own buildings to see if thin wisps of smoke were coming from them. If they were safe you breathed a deep sigh of relief and then turned to help. You probably jumped on a horse and raced to the fire to help your neighbor, but you really couldn't do much, for the barn was like so much tinder and the grain inside was fine fuel. You tried to save the stock and the implements, but you could do little. After the fire you turned to offer consolaion and any help you could give. The fire had done its work.

That's a little story which happens hundreds of times each year on our Maritime farms. Barns, filled with grain and stock, and representing the work of years, go up in smoke, and nothing is left but charred ruins.

Last year I investigated over seventy fires, andfound that all but one were wooden buildings throughout. The one had a metal roof and wood sides. Fire in this last building was caused by a spark from a threshing engine. It caught down in one corner just above the foundation. When it was discovered it had gained such headway that there was no chance to save a thing. Most of the other fires were caused by lightning.

I just received a report for 1914 and 1915, and find that in the two years 668 barns were struck by lightning. Of these 218 were a total loss. Many of the others had to be rebuilt; some were repaired. These are barns which were insured; no doubt there were many others with no insurance whatever. Besides these losses there were many barns set afire by threshing engines, sparks from house chimneys, and overturned lanterns.

A year ago I picked at random the reports of 27 fires on Ontario farms. The losses amounted to $119,000.00. I wonder just what the losses of the 218 fires would amount to? Putting the thing down in cold figures, it is appalling.

I talked with one man after his fire, and asked him why he hadn't built with some fireproof material, and he told me: "I figured that metal was too expensive and I couldn't afford it, but I guess I'm paying for it now. I haven't my crops insured, and they're all gone. It means a year's hard work all knocked to ——, and I've got to start in and build all over again. And I even lost some of my stock. You can bet your bottom dollar that I'll put metal on the next barn." His story is told to the salesmen of metal companies many times a year. The proof of it is shown in the increased number of metal-covered barns throughout the country.

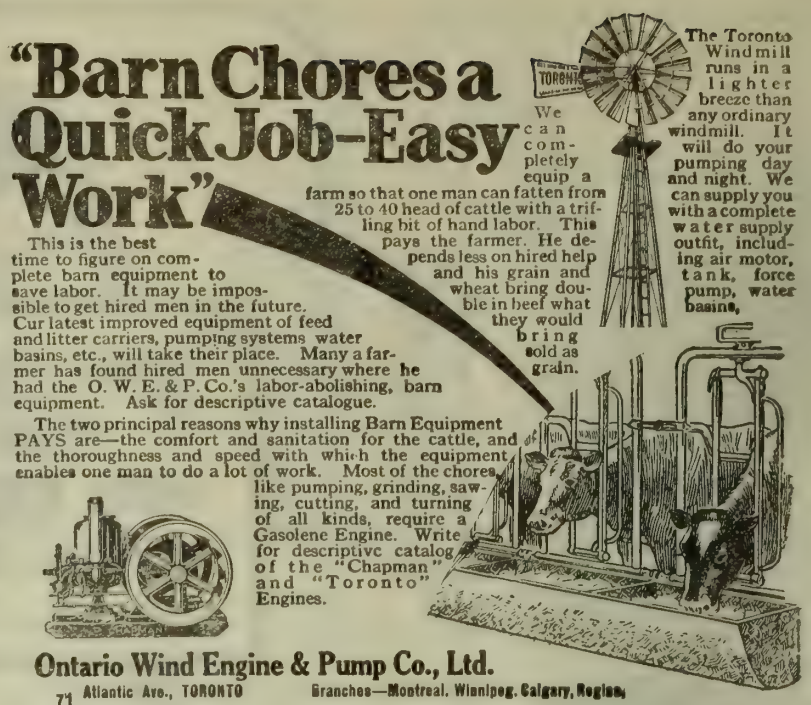
Farmers are waking up to the fact that they haven't the protection given in the cities, and they must offset that by building with fireproof materials. When John Slee, of Doon, lost his buildings by fire he immediately put up a metal-covered barn; when the entire set of buildings at the Mt. Elgin Institute was destroyed by fire they were replaced by meal buildings; when Thos McCracken of Streetsville, Thos. Curtis of Verulam, J. Baskerville of Thorndale, and many others lost their barns by fire they decided that metal was not too expensive in the long run, and they put up metal-covered barns.

Metal is insurance in itself. It is practically absolute protection from all outside fire causes. A metal-covered building properly "grounded" with wires from the corners into the ground is an absolute lightning protection. Sparks from threshing engines or chimneys can do no damage to a metal-covered building—they can drop on the metal, but they die out there.

When the Wilks stables, at Galt, burned out a couple of years ago there was a little storage shed about fifteen feet from the main barn. It was covered with metal shingles. Fire brands from the big fire rained down on it, but when the other buildings were burned to the ground this old shed was still standing. What did Miss Wilks do? She rebuilt, and she used a complete metal covering for all her buildings. She figured that wooden buildings were too expensive an investment.

I could give you the names of thousands of farmers who have built with metal because they wanted to feel sure that their crops and their stock would be safely protected from fire and lightning. They figured the cost—not from the first price standpoint, but from the standpoint of long life and protection. They did not listen to the few who kicked about price, but they investigated, and found that metal covered buildings were CHEAPER than wood in every case.

The protection afforded by metal should make every prospective building farmer sit down and think hard in making his plans. And when the time for the decision came there should be no hesitancy in choosing metal as a complete covering.



"Barn Chores a Quick Job-Easy Work"
This is the best time to figure on complete barn equipment to save labor. It may be impossible to get hired men in the future. Our latest improved equipment of feed and litter carriers, pumping systems water basins, etc., will take their place. Many a farmer has found hired men unnecessary where he had the O. W. E. & P. Co.'s labor-abolishing, barn equipment. Ask for descriptive catalogue.
We can completely equip a farm so that one man can fatten from 25 to 40 head of cattle with a trifling bit of hand labor. This pays the farmer. He depends less on hired help and his grain and wheat bring double in beef what they would bring sold as grain.
The two principal reasons why installing Barn Equipment PAYS are—the comfort and sanitation for the cattle, and the thoroughness and speed with which the equipment enables one man to do a lot of work. Most of the chores, like pumping, grinding, sawing, cutting, and turning of all kinds, require a Gasolene Engine. Write for descriptive catalog of the "Chapman" and "Toronto" Engines.
The Toronto Windmill runs in a lighter breeze than any ordinary windmill. It will do your pumping day and night. We can supply you with a complete water supply outfit, including air motor, tank, force pump, water basins,

FALSE ECONOMY

Correspondents have advised us that fruit growers in some districts have decided not to spray this season. They presume that "prices will be so low that it will not pay to spray."

In the light of our experience of the past two years, it is surprising to find any growers holding this view of the situation. In the fall of 1914 the apple crop was large; part of the fruit was left to waste on the ground, and there was little prospect of exporting even the usual quantities. A special effort was at once put forth to extend our home market and to increase consumption. The result was that all the fruit harvested was consumed quickly, and here was a shortage in the spring months. This experience alone should encourage the grower to do his utmost to produce clean, high-quality fruit this year.

Growers, especially those in Eastern Canada, will also remember well the crop of last year. Owing to the great amount of scab which developed during a very wet summer, the percentage of No. 1 apples was small, and on account of the short crop it was thought by some than even the most inferior apples would find a market. Instead of that, the shipping of such fruit resulted in a heavy loss in most cases.

The consuming public is obviously becoming more discriminating every year, and inferior, scabby apples which a few years ago found a fair market cannot now be sold at remunerative prices. This fact was clearly demonstrated last year by the very high prices realized for the better grades and the difficulty of selling inferior fruit, except at very low prices.

We would again urge every grower to spray judiciously and thoroughly. Neglecting to do so is false economy. Better fruit means better prices. It is impossible at this date to estimate what our crop of apples is going to be, although the bloom is very heavy; but whether it be a heavy crop or a light one the grower who has clean, high-quality fruit will experience the least difficulty in marketing it.

HOGS

As is well known, hogs have reached an unprecedentedly high level—$11.65 per cwt. being paid for fed and watered on the Toronto market. The fact that, even with live hogs at this figure, shipments of bacon are regularly going forward to England will serve to illustrate very clearly the demand for that product on the British market. Without doubt Canada stands in a better position today to develop a permanent bacon trade with Great Britain than has ever been the case before. To do this, however, there must be volume of supply. There is very good reason to believe that, although prices cannot be expected to remain at the present high level, the demand for bacon, in the face of the supply that can be obtained, will be such as to hold the market in a very firm condition both during and for a considerable period following the war.

Great Britain's imports of bacon in 1915 amounted to £25,441,460. From Canada she obtained only £3,324,511. The fact that Canadian bacon has been selling at an advance of from 10 to 12s. per cwt. above American, and at not more than 12s. under the nominal quotation for Danish, illustrates very clearly to what extent Canada could increase her export trade had she a sufficient quantity of hogs to make this possible The English merchant and the British consumer will buy Canadian bacon today, quality being equal, in preference to that from any other country in the world, with the possible exception of Ireland. Not only so, but an enormous market exists also for hams, frozen pork, and

pork cuts of various descriptions. This market is as remunerative as the bacon trade, although it is not likely to prove as constant. The West is producing a great quantity of rough grain this year. As compared with wheat, it will probably be relatively low in price. It should, therefore, be a sound business proposition to breed as many sows this spring as would provide each farm next fall with such a number of feeding hogs as can be conveniently handled and suitably finished. They should, however, be so selected and mated as to maintain the approved bacon type. Unless this be done we cannot compete with Ireland and Denmark, and will lose status on the British market. The development of our bacon trade is a purely commercial undertaking ,and we must recognize that we cannot sell to the British merchant unless we give him what he wants. This granted, thrifty management and good feeding should yield a return this year which will more than compensate for all the labor involved.

NATIONAL LIVE STOCK RECORDS

Ottawa, Canada, May 27, 1916.
Editor the Maritime Farmer:

The breeding of horses has become a matter of prime necessity. Before the war commenced there was a slump in prices, owing to financial conditions and the inroads of motor power, that led to a cessation of breeding. Then the war came, with its demand for certain classes. Following the precious decline in the demand, many farmers sacrificed their mares. The result is a serious depletion and a sure scarcity.

The demand is increasing and will continue to increase long after peace has been declared. If Canada is to take advantage of the situation, the time to start in is now. There will be an assured market for foals at weaning time from mares bred now.

Not only has the wastage by reason of war been enormous, but in all the belligerent countries, not omitting Great Britain, there has either been a partial stoppage or a whole stoppage of breeding by reason of the scarcity of labor, the disturbed conditions, or entire devastation.

Whether the war lasts or ceases, there must continue an undiminished demand for horses. When peace comes there will be a long period of replenishment. Then quality as much, and even more than, quantity will be required. Hence the evident call to every Canadian farmer is to breed, and to breed to the best available, to utilize his mares for production, and to secure the immediate services of the best pure-bred sire of type in his neighborhood. It will pay.

This appeal is addressed to you with the endorsation of the various horse breeders' associations of Canada, who urge decisive action by the farmers of Canada to remedy the serious situation that has arisen.

Yours truly,
CANADIAN NATIONAL
LIVE STOCK RECORDS.

A BUSY MARITIME INDUSTRY

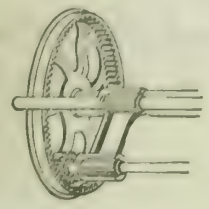
One of the very busiest industries in the Maritime Provinces at the present time is the Carritte-Paterson Mfg. Co., which has factories at Halifax and at Sydney. Their principal product is roofing material; such as Two and Three Ply Roofing, Mineral Surface Roofing, Rubber Roofing, and Tar & Gravel Roofing. They also specialize on coal tar products, and make the well-known "Tarvia" for street paving. One of the Carritte-Paterson by-products is Coal Tar Creosote Oil, the highest class wood preservative known. And in connection with this article it is interesting to learn that in the United States its sale for preserving timber is larger, measured by gallons, at the present time than the sale of gasoline for motive power which is being so much discussed by the press and public owing to the increase in cost. The use of Coal Tar Creosote Oil in Canada is becoming larger each year. This oil is used as a base in the manufacture of Velvex Single Stains, now so popular in all parts of this country. Other products of the Carritte-Paterson factories are Carbonol, a disinfectant; Creonoid, a cow spray; and Everjet carbon paint for wood and metal protection. These products are sold by the hardware and general store trade throughout the provinces, and special lierature regarding them will be sent on application to the Carritte-Paterson Mfg. Co., Ld., St. John, Halifax, and Sydney.

A Frost & Wood Mower starts to cut the moment the horses move

The Frost & Wood Mower

will not fail you

WHY is the Frost & Wood Mower light in draft? We use only the finest, toughest materials that money will buy, consequently parts need not be so heavy. In addition we use expensive-to-make roller-bearings wherever friction might occur. Heavy brass bushings prevent wear and keep driving shafts in absolute alignment. Cutter bar under quick control and goes on cutting when raised to clear an obstruction, which is a great saving of time.

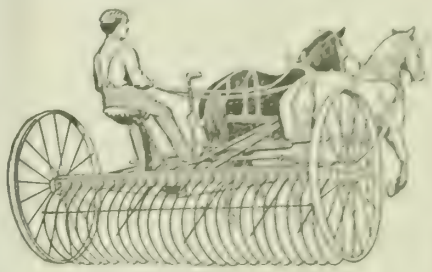


Internal drive gear gives big, quick power.

THE Frost & Wood Internal Drive Gear is a splendid engineering feat. The big driving gear wheel engages on the inside with the cutter-bar operating pinion, both wheels turning in the same direction, there is no "pushing apart," chapped cogs, loss power or jerk when starting cutting. This saves tremendously on wear and cuts repair bills to practically nothing. Levers are easily worked. In fact, it is no exaggeration to say a bay or girl can operate this machine.

Frost & Wood Rake

Here is an all-steel, practically indestructible rake good for many years of hardest service. Automatic dumping trip acts instantaneously. The teeth have high clearance and do not drag the top of the windrow. Dumps at slight pressure on foot pedal. Teeth are especially fine tempered steel, every tooth carefully tested before it leaves our factory. The Frost & Wood Rake will stand any test and has thousands of friends all over Canada.



Our nearest agent can advise you on any implement need and give you folders and particulars on the above implements.

ARTIFICIAL FARM DRAINAGE

(Continued from page 557)

work, but I have no data as to their durability.

There should be as few outlets as possible for an under drain system, as here is where stoppage is most likely to occur. In some soils where there is more or less moving sand, silt basins may be necessary.

The technical work of laying out a system, size of tile for water flow, grades which will work and which will not work, and engineering difficulties that may arise can, I think, only be discussed on the field, or with diagrams and instruments when there is ample time, and I will not attempt this branch of he subject. In view of the promises of the Minister of Agriculture that he will supply men to do this work for farmers who intend to invest money in draining, this important part of the work, at any rate, is provided for, and the farmer can learn from the surveyor in his own fields.

Open Ditches and Surface Drainage

While under drainage is by far the cost satisfactory system of taking surplus water from the soil, tas it leaves no obstruction on the surface of the ground, requires but little attention for a life time if properly constructed, yet such land can be reclaimed by open ditching at much less expense. With appliances now available, horse labor can be made to do the work. There are a number of plows made for this purpose. At the Experimental Station we have one, made for the first time in Canada last season, that does very good work. Where there are no roots or boulders this plow, with four horses, will dig very satisfactorily and quickly to a depth of from 20 to 30 inches, making a ditch with a wide flare, and spreading the earth well back. Machines are also made that will work on land too soft to carry a team by using a cable and two capstans.

There are considerable areas in New Brunswick which are today lying idle that could be thrown up into ridges with wide open ditches between them, say 2 feet deep, that would produce large crops of hay for many years. On very flat land, or where there are cuplike hollows, this surface open ditching is frequently necessary to take away the surface flow even if the land be under drained. Then again there is frequently the necessity of making depressions to control the surface flow in spring and fall, especially after the ground freezes. Such depressions can be made with the plow and scraper. If a depth of two feet is necessary, the width of the depression should not be less than from 30 to 40 feet, and to this form it offers no obstruction to cultivation or harvesting.

Capital Essential

The discussion of this subject would not be complete without a reference to the necessity for some better means than available at present of securing money wherewith to prosecut drainage and other permanent agricultural improvements. Canadian banks, although willing to absorb all the farmers' savings that are brought to them and pay the generous interest thereon of 3 per cent., will not loan this same money at 7 per cent upon terms which will permit its employment for drainage or any operation giving only slow returns. Some system is, therefore, necessary for the agricultural development of this country whereby money can be obtained at a low rate and for long terms. Such systems do exist in Europe, and one reason today that Germany is so nearly self-sustaining in an agricultural sense is because of the splendid system of farmers' banking which has been in existence there for over fifty years.

It is cheering to note that in the campaign for greater production in Canada attention is being given by the Finance Minister, and to some extent by the bankers, to the need which I have stated, and if our farmers generally would express their desires in this regard the day when a system of agricultural banking would be inaugurated would be much hastened.

Some eighteen years ago the late Professor John Davidson, of the University of New Brunswick, read a paper before this Association giving the history and methods of the German system of land banks, as they were termed, and urged the value of such a system in this country; but our people were not then impressed with its importance, and I remember the only reply that I received after urging Prof. Davidson's views was from a gentleman who was the prospective heir to a quarter of a million to the effect that if I were not satisfied with the action of the Canadian banks at that time there was nothing to prevent me and four of my friends from getting a charter and starting a bank of our own. (This remark, I remember, was applauded at the meeting.)

Increased production from the farms of Canada means increased wealth for every one in the country, and in their own interests our moneyed men should be far-sighted enough to help in making agricultural development possible, and so help to build up a country that shall stand second to none on the face of the earth.

Your Kidneys

may cause DROPSY, RHEUMATISM, BACKACHE or GENERAL WEAKNESS.

Dr. Cassell's Tablets are the Proved Remedy. Take them for all Kidney & Urinary Troubles.

In these trying complaints Dr. Cassell's Tablets are of proved value. They restore perfect efficiency to the kidneys by nourishing the nerves which control kidney action, and thus enable the system to get rid of uric acid and other impurities which are the cause of Urinary Troubles, Dropsy, and Rheumatism.

Dr. Chas. Forshaw, D.Sc., F.C.S., etc., the well-known scientist, says: "I have thoroughly tested Dr. Cassell's Tablets, and can conscientiously recommend them as an eminently safe and effective remedy for all forms of nerve and bodily weakness. My knowledge of Dr. Cassell's Tablets leads me to the opinion that the ingredients form a remarkably potent medicine, quite safe for young and old in cases of nervous prostration, debility, anæmia, loss of flesh, malnutrition, children's weakness, spinal and nerve paralysis, and many forms of stomach and kidney troubles."

Dr. Cassell's Tablets raise the vital standard of the entire system, and thus promote kidney health and general health when other means fail.

Dr. Cassell's Tablets are Nutritive, Restorative, Alterative, and Anti-Spasmodic, and of great Therapeutic value in all derangements of the Nerve and Functional Systems in old or young. They are the recognised home remedy for Nervous Breakdown, Nerve and Spinal Paralysis, Infantile Paralysis, Rickets, St. Vitus' Dance, Anæmia, Sleeplessness, Kidney Disease, Dyspepsia, Stomach Catarrh, Brain Fag, Headache, Palpitation, Wasting Diseases, Vital Exhaustion, Loss of Flesh, and Premature Decay. Specially valuable for Nursing Mothers and during the Critical Periods of Life.

Druggists and Dealers throughout Canada sell Dr. Cassell's Tablets. If not procurable in your city send to the sole agents, Harold F. Ritchie & Co., Ltd., 10, McCaul Street, Toronto; one tube 50 cents, six tubes for the price of five.

Sole Proprietors:—Dr. Cassell's Co., Ltd., Manchester, Eng.

Send your name and address and 5 cents for postage, etc., to Harold F. Ritchie & Co., Ltd., 10, McCaul Street, Toronto, and a generous sample will be mailed you free of charge.

WHEN THE FARM ANIMAL IS WOUNDED

In the past, when barbed wire constituted the great bulk of the material used for fencing purposes, wounds on the farm animals were far more common than today. Yet even now occasionally a valuable cow or horse comes in from the pasture bringing with him a gaping wound that may have been caused by any one of several things. The ability to dress this wound so that it will heal rapidly and leave as little blemish as possible is quite an asset to the farmer, or any of the family who happen to possess the required requisites. I have seen such wounds left gaping and a great blemish would result, while, on the other hand, even a single stitch would have relieved the difficulty and increased the value of the animal by a good many dollars.

The moment an animal appears with such a wound, drop other work and attend to it at once, for it may mean a saving of dollars. Act 1 is to wash the hands thoroughly. One cannot be too thorough about this, for surgery was never a pronounced success until the great English surgeon demonstrated that most of the infections arising from wounds resulted by contaminations from the hands or instruments of the operator. For the hand wash, use boiled water, adding 15 or 20 drops of carbolic acid to each quart of water. Ue a good hand brush and soap; wash the hands thoroughly, being especially careful to get the portions about the nails clean. Of course, any of the patented disinfectants are all right if used according to the recommendations of the manufacturers.

Now one is ready to wash the sore. It must be cleaned out before it can heal. Use carbolic acid water in the same proportions as in the hand wash, being sure that the water has been boiled. A cloth is so likely to become polluted that I find a cotton sponge more satisfactory. Twenty-five cents' worth of absorbent cotton will make a good many sponges and will last for a long time. Break off pieces of this cotton and put into the wash water. These may be taken out of the water, and, after using to sponge out the wound, may be thrown away. Be thorough in cleansing the wound.

In the meantime, if the cut is one that should be sewed up, and a sur-

A MATTER OF NECESSITY

The movements of business are so rapid and the nature of business activities so complex that technical training is a matter of necessity, not a matter of choice. Competition in business demands accurate knowledge. The methods of today must be failure-proof. There is no time to learn as you go.

You should begin your course NOW at the

Moncton Business College
Geo. J. Schmidt, Principal
Moncton, N. B.

ADVERTISE IN THE MARITIME FARMER TO GET RESULTS.

geon's needle and hread are not at hand, do not leave the wound dangerously gaping for want of a needle. I have seen good work done with an ordinary darning needle and good linen thread, provided these were clean. If these are all that are available, put the darning needle and some white linen thread in a pie tin on the stove, cover with water, and allow to boil for about 10 minutes. With clean hands, clean sore, an dsanitary thread and needle, proceed to take as many stitches as are needed, having them about three-quarters of an inch apart, and not getting too near the edge of the wound. Leave the ends of the stitches a little long, so that they may be cut in seven or eight days with a pair of scissors. These, of course, should also be subjected to boiling. If the sides of the sore should get dry, grease them with vaseline. Remember that a healthy body is all that can heal such a gap; internal remedies are of no account in this connection. Greasing the sides of the sore will make them knit together more quickly and easily. If the sore starts to run, it may be necessary to sponge it off as often as it needs it, with carbolized water.

Especially in fly time, flies will either lay eggs in the sore or carry infection to it, and it is necessary to keep them away. The Department of Agriculture recommends he following formulas to keep flies away from animal wounds:

Formula 1—Oil of tar, 8 ounces; cottonseed meal to make 32 ounces.

Formula 2—Powdered naphthalin, 2 ounces; hydrous wool fat, 14 ounces.

Formula 3—Coal tar, 12 ounces; carbon disulphid, 4 ounces.

Mix well and apply with a brush. These are mixed into an ointment.

Remember that carbon disulphid easily turns into a gas, and so the bottle must be well stoppered. The mixture can be applied with a brush. Carbon disulphid is also highly inflammable, and so lights or heat should be kept away from it.

In the case of a very bad wound, a skilled veterinarian should be called, but many times one of these cannot be had, and so immediate action is necessary to prevent further injury to the animal.

LEAKS IN FOUNTAIN PENS

When a foundtain pen is leaking the leak is usually found at joint where the pen is filled. This leak is always small, nevertheless it is very annoying, for no matter how dry you wipe the joint your fingers are always soiled whenever the pen is used.

To prevent this trouble, use a small amount of tanglefoot such as is found on sticky fly paper. Apply this to the threads and joints, screw the joint back in place, and wipe off the surplus. Te tanglefoot always remains sticky, never dries up, and no ink can pass by it, since the leak is caused by capillary action.

If properly applied, the tanglefoot will prevent the pen leaking for at least a year.

TO WAX FLOORS

Into a basin shave one pound of beeswax. Shave as thin as possible, cover the shaved beeswax with turpentine, let stand twenty-four hours. Then rub into floor or linoleum with a woolen cloth. Have the floor or linoleum perfectly clean. Do not heat the wax before rubbing it in. This will prolong the life of linoleum and give the floor a beautiful finish.

FORMALIN VS. BLUESTONE FOR SMUT

R. A. Wilson writes us: "Once again the time of year draws near when the successful farmer will be deliberating on the best method of treating his wheat for the prevention of smut. Last year's smut showed in this locality that wheat treated with bluestone was the best. Four or five years ago many of our neighbors advocated the use of formalin as being cheaper, easier handled, and fully as successful as bluestone. Three of us who up to that time had used bluestone, decided to try the formalin. Three years ago we used formalin, strictly following directions, but found smut when we were stocking the crop, for the first time in years, so we went back to bluestone. Our neighbors did not notice it, but used formalin again, and thought we must have failed to use formalin properly. Last year these same men had a lot of smut.

"The best way to dissolve bluestone is to get a new granite kettle, as bluestone will not eat through it; put in the amount of bluestone required, add sufficient boiling water to cover, and put on hot stove untfl dissolved. We use one pound of bluestone to ten bushels of wheat, and have always found it successful."

CREAM SEPARATOR MANUFACTURERS SAY

that two-thirds of all complaints about cream separators are due to faulty lubrication. That is because the close-fitting, fast-running mechanism of the separator demands a special oil—and most people use "just any old oil."

Standard Hand Separator Oil

is made especially for cream separators and we know that it is "right," because our lubrication experts have made a study of separator construction and exactly adapted the oil to the requirements. Dealers everywhere.

AMAZON ROOFING

HERE is a ready and easy-to-lay roofing that withstands all the elements and wears indefinitely. No better "rubber roofing" could be made. It consists of a strong, fibrous, all-wool felt thoroughly saturated with non-volatile compounds. It is the high quality of this felt and the skill of saturation that make our roofings supreme. They never dry out or run. You will see this if you try Amazon Roofing.

Real Roofing Insurance

Amazon on your steep-roofed buildings means real roofing insurance. It means, first and last, the best protection against wind and weather, that you can get. Wherever you have steep roofs, use Amazon. It will pay you. Made in three different weights to meet all roofing requirements. We carry them all and can fill your orders now. Do not neglect your roofs. Fix them once for all with Amazon.

WHAT PRICE DO YOU PAY FOR TEA?

This is Very Important on Account of Changed Conditions

Conditions in the tea markets of the world have changed considerably since the war. On account of Russia prohibiting the sale of vodka and France putting the ban on absinthe, these countries have become larger consumers of tea. In fact, France and other countries have followed the English custom of serving tea to the troops instead of coffee, and this takes an enormous supply of tea.

These largely increased demands for tea would be sufficient in themselves to have caused a rise in tea values. But, in addition, ocean freight rates are three times normal, and insurance rates are very high, and over eighteen million pounds of tea have been lost on vessels which have been sunk by German cruisers and submarines since war began.

The foregoing facts explain why tea is higher in price than before the war. If you are still paying the same price for tea as you were eight months or so ago you are getting a lower grade than the tea you formerly used. For example if you are paying 40 cents a pound you are getting the quality that sold at 30 cents a year ago. The old 40-cent quality is now selling at 50 cents—in fact, has been selling at this price for months. If any one has not been enjoying their tea lately they will no doubt find that they have not been getting the same grade or label, consequenty it has not tasted so good. The flavor wasn't so full or so rich.

But tea at 50, 60, and 70 cents a pound is not dear. In fact, it is the cheapest hot drink obtainable when you consider the great number of cups of tea a pound will make. At 50 cents a pound the cost per cup is only 1-5 of a cent, so small that it is hardly worth considering.

There are more people enjoying tea today than ever before, and what other beverage will give so much real enjoyment at so small a cost? And while tea sells at anywhere near its present moderate prices there is no reason for not enjoying our due share of this delightful beverage.

SHEEP

Lamb and mutton are dear all the world over. Scotch mutton is now selling on the Smithfield market at 22 to 22¾ cents per lb., and English at 21 to 22 cents per lb. Both Australian and New Zealand frozen lamb on the same market are selling at 17½ cents. Yearling lambs in Canada have reached the record price of $14.00 per cwt., while in the United States they have been fetching as high as $11.80. By way of comparison, these prices considerably exceed the advance in values for other live stock, but no appreciable reduction need be expected except through a rapid and general expansion in production.

The wool situation needs little comment. While it is probably true that the mills in Canada have, at the present moment, sufficient stocks of Canadian-grown wool to meet their requirements for the current months, such is only a temporary condition, and is not similarly the fact as regards their requirements for wool not grown in Canada. The position of the world wool market is very firm indeed. To quote from the report of the wool sales held in London on the 11th of April: "Competition was thoroughly strong and well distributed. The demand for cross breds has been lively." There is no indication from any quarter that the market for wool will be overstocked, or that prices will recede. The contrary rather is the case. Russia and France are purchasing heavily in Great Britain, while United States and Canada are not easily able to obtain their requirements. Farmers unquestionably are in a very strong position as regards the sale of their wool this year.

The maintenance of present prices can have only one result. Already renewed interest is being evidenced by farmers who have not kept sheep for years. Ram sales were particularly good last fall. More sheep are being bred in many of the provinces. We believe that this year will show a further extension of the business. As a matter of fact, no farm animal can be made more profitable at the present time to its owner. The keeping of sheep for the sake of the wool alone may become an economic necessity. With grade lambs selling on the open market for more than pure breds brought two or three years ago, a revival of the sheep industry in Canada may confidently be anticipated.

HEREDITY

The laws of heredity are a continual puzzle to breeders of live stock, and the oft-quoted maxim that "like produces like" does not always appear to come true. Possibly a slight alteration would be an improvement—like produces like from like. Not only must sire and dam of the same type, but their ancestry must be of the same type, too. "Throwing back," that bugbear of the crossbreeder, has never been fully explained, although Mendel's researches and discoveries have brought much light to the subject. This breeding back is undoubtedly due to some powerful ancestral influence. Many apparent freaks and "sports" in both animal and vegetable kingdoms are doubtless due to reversion or atavism. De de Vries has found that plants appear at long and irregular intervals that have distinct differences from their parents, and that these new characters are permanent. This is almost a new theory as to the way in which evolution proceeds. Very few plants have been noticed to change in this manner, and much study is needed before the theory can be fully established. Variation from type is also brought about in a way not often considered in the present day.

Imitate Surroundings

It is a well-known fact that animals mimic in the color of their coats their natural surroundings. This mimicry is thought to have taken years and ages to accomplish—was only produced by a long course of selection in which animals that had not this protecting mimicry were killed off by their enemies. Jacob knew better than this four thousand years ago, and, surrounding his breeding places with striped and mottled fences and posts, he quickly produced striped and speckled animals in his flocks. Doubtless he knew that "nervous impression" produced on the female at the first service aided nature considerably in her mimicry. Scientists call this phenomenon Telegony, and it is still a force breeders have to meet, as the trite old text says, "unto the third and fourth generation." Climate is also responsible for many variations from the law of heredity. Though changes from this cause are certainly very gradual, and not much noticed in one generation, we find in every country this adaptation to surrounding circumstances producing a difference in type. Cold stimulates the growth of hair till it becomes thick and woolly, as in the Iceland ponies. The rocky mountains of Scotland and Wales have produced the hard, flint-like hoofs of the mountain ponies found in these countries, just as the lowlands have produced the heavy, wide-soled draught horses. Rough treatment and fright can hardly be considered a part of nature's great purpose, but they make their influence felt none the less on the young as yet unborn.—S. J. Wigley.

One broken or soft-shelled egg will often start an entire flock in the habit of eating eggs. Furnish plenty of attractive nests to avoid crowding. It is best to have nests secluded and darkened and rather high up.

You Men Who Need Roofing Materials

FOR NEW ROOFS OR FOR OLD BUILDINGS

If you could step into my warehouse and see with your own eyes the Roofing I offer. If you could compare it and test it alongside of any other roofing you know. If you could see the stack of letters testifying to the genuineness of our values. If you could do this there is no doubt what your answer would be.

But you can't—You can't very well come to me. And so I am coming to YOU, with the most liberal, open-and-above-board,

RISK-FREE
Test-and-Try-Before-You-Buy

offer that has ever been put in print. I want you to see a sample of my Roofing. I want you to test and compare it any way you like.

Forget my low price. Think of quality only. Then if you find my Roofing equal to, or better than others, and if you also find it much lower in price, I know that I can leave the rest to your common sense.

Mr. L. E. Allen says:

"I have carefully compared by testing in several ways the sample you sent me, with Roofing at over $3.00 per roll, and can find no difference!" (Cost to Mr. Allen was $1.85 three ply.)

I want you to have the same chance as Mr. Allen. I want to send to your station at my risk, all carriage charge paid, a sample Roll of my Pure Asphalt Roofing. Government standard saturation. Complete with rust-proof nails, cement, and full instructions for laying. Each Roll covers one square, allowing for laps.

I will ask you for no promises in advance. I gladly take all risk because I have already proved in hundreds of cases that my Roofing sells itself. Hundreds of customers testify to savings of from 75 cents to one dollar and more per roll. No matter what size or style of building you have, I can save you money on the Roofing. Give me your name and address on the enclosed coupon.

FRANK J. HALLIDAY, President,
Hamilton, Canada.

I am interested in Roofing for my ..... The size of the roof is ..... ridge ..... rafter. Please say how many squares of your Roofing will be required. Also send to .... BARB-WIRE WOUNDS

After a barb-wire accident, do not apply axle grease or any rancid ointment to the wound. Wash the wound thoroughly with warm water. Then clip the hair as closely as possible around it, and wash again to remove any hair or other foreign substance. When sand or hair has lodged in the depths of a deep cut, never use a wet sponge to clean it out. Use a piece of absorbent cotton or cotton batting. There will be much less risk of infection. It will be useless to put any stitches in a wound that is very deep or ragged, or that is located in a place not in perfect rest when the animal is making natural movements. Dry dusting powder has a healing effect on barb-wire wounds and other large, moist cuts and abrasions. Such a powder may be prepared cheaply by mixing together equal parts of slaked lime, sulphur, and charcoal. Prevent lock-jaw dangers in all nail wounds of the hoof by opening them up freely, which provides drainage for serum and pus. Saturate with a solution of corrosive sublimate and water in the proportion of 1 to 500. Cover with dusting powder, absorbent cotton, and a bandage. This treatment should be repeated daily until the wound is healed.

RINGWORM

The term Ringworm is applied to a skin disease of animals which is caused by a parasite of a fungus nature, and the disease only results by an animal becoming infected with this parasitic fungus or ringworm parasite. The vitality of the ringworm parasite is very great, and often after removal from an animal it will live and remain active for a great length of time in a stable. Ringworm may be conveyed or spread either by direct contact with affected animals or indirectly by various intermediate agencies, such as infected bedding, blankets, curry combs, and brushes which have been in use. Calves and young cattle are most commonly affected with ringworm, more especially when kept confined in close, damp, winter quarters which are predisposing factors. Adult cattle and horses are less commonly affected, although they are also liable to be attacked. On certain premises, where ringworm occurs among calves, the parasite may remain on the walls, stalls, posts of the building and fences, and the disease may be continued on the premises and conveyed to calves from year to year, each winter.

Symptoms of Ringworm

The parasites attack and destroy the hair, so that the disease becomes manifest by the formation of circular bare patches of skin. The affected parts of the skin become scaly in appearance and encrusted with scabs of a silvery-gray color, and when the scabs are removed a raw bleeding surface is exposed. Among yearlings and calves the disease occurs most frequently and is noticed to affect the regions around the eyes, ears, neck, and shoulders, and in some cases in calves may chiefly affect the skin around the mouth and lips. In horses ringworm is chiefly seen affecting the foals and young horses, and in them is noticed more often to affect the upper parts of the body, such as over the shoulders, the back, loins and croup, and along the side of the neck and head. Ringworm is also transmissable from affected animals to human beings, so that a person should guard against this possibility.

Treatment of Ringworm

Animals affected with ringworm should be separated from non-affected animals until they have been cured of the disease, in order to prevent its spread. The first steps in treatment should be to remove all the bedding and litter from the stalls each day and have it burned and replaced with fresh, clean bedding. The curry combs, brushes, blankets, and other articles in use with affected animals should be disinfected either by boiling or soaking in a strong antiseptic solution, such as a 3 per cent solution of carbolic acid or creolin, made by adding three parts of the drug to 100 parts of warm water.

Stables occupied by the affected animals should be cleaned and disinfected with limewash and carbolic acid. If these precautions are followed out, the affected animals can then be readily cured of he disease by thoroughly washing the affected parts with warm water and soap to remove all the encrusted scabs and matted hair The hair around the margins of the affected parts should be closely clipped. After washing the affected parts they should be allowed to dry, and then dressed with tincture of iodine. In using the tincture of iodine, it should be mixed in an equal amount of clean water and applied to the affected parts once a day by means of a small brush or a cotton swab until all of the affected parts are completely coated over. The iodine treatment should be applied daily until all of the affected parts are healed.

Another good preparation for the treatment of ringworm is a mixture composed of equal parts of tincture of iodine, carbolic acid, and water, and which is applied in the same manner as the iodine itself. Another useful remedy for he treatment of ringworm is sulphur ointment. This is made by mixing one part of sulphur and two parts of lard together to form an ointment. The ointment is then smeared over the affected parts each day until a cure is affected. While the affected animals are under treatment they hould be kept separate from non-affected animals on the premises until they are completely cured of the disease.

FIGHTING INSECTS ON HOUSE PLANTS

Many persons have considerable difficulty with insects getting on their house plants, and they experience much annoyance in getting rid of them successfully.

Tobacco dust will in a great measure prevent the insects from getting a start. Chopped tobacco stems laid on top of the soil in flower pots will kill many insects, and prevent others from coming. Powdered tobacco well mixed with the soil on the surface is good, and a number of liquid tobacco preparations when diluted with water will kill most pests, but all these things are more or less trouble and cause annoyance to persons who do not like tobacco.

Tobacco smoke will drive the insects off, but this is so mild, owing to the fresh air all about the plants, that it only acts in a temporary manner. If a person can shut up a plant in a tight room or a cabinet made especially for the purpose, and the fumes of the tobacco are abundant enough, it will kill all insect life.

Expert florists have to fumigate with tobacco and other poisons to rid their houses of insects. Some of the chemicals are sure death to the pests, but they would injure or kill the persons using them if they did not make a hasty retreat.

All these things are all right in their places, but for an ordinary house, where a few plants are kept, there is a much better and safer, as well as a more pleasant, way to proceed.

Use hot water to kill the pests. I hear my friends say that it will kill the plants. Try it and see, just as I did, the great good it will do.

If you have the aphis or white fly, or other forms of insect pests that are causing the plants to look sickly, heat water until it is at a temperature of from 125 to 130 degrees by a reliable thermometer. Have the water in a vessel large enough to permit giving the plant a dip. Hold the hand over the soil in the pot, allowing the fingers to pass on each side of the stem of the plant. Dip the top of the plant into the water until the foliage has been immersed. Do not allow the plant to remain in the water more than a second or two. Longer will injure the foliage. Dip the pot and soil into the water also. This can be allowed to remain for several seconds without danger of injury.

Should the plant be too large to dip into the hot water, sprinkle the plant thoroughly with water at the above temperature. A light sponge will help greatly in bathing the foliage of large plants with hot water. Many insects can be killed in that manner.

If you have a sickly looking plant and you cannot see insects about it, try pouring some hot water in the pot, about the edges, or try setting the pot in some warm water in a shallow pan. This acts like magic in restoring a plant to its natural condition. Heat is life if used in the right way, and it is death to the delicate little insects that live by sapping the life of the plant for days and weeks.

GURNEY-OXFORD

TO WASH SWEATER AND OTHER WOOLLENS WITHOUT SHRINKING

"Before I wash my sweater, I take it out and beat it or shake it until all the dust is out of it. Then I make a soap paste by taking a quart of boiling water and shaving into that one bar of good soap; then I add six tablespoonfuls of borax and heat the mixture until the soap is dissolved. I take a bowl or clean dishpan and fill it three-fourths full of lukewarm water, and put in half a cup of the soap solution. If the water is very hard, I add a teaspoonful of borax for each gallon of water. Then I soak the sweater in that and place the plan where the temperature of the water will remain the same. I leave this for several hours. After that I wash the sweater by pulling it up and down, or else I work it with a kneading movement, but I never rub it on the board, nor do I rub it with my hands, or rub soap on it, for that would shrink it. If it has spots that need special attention, I take a small brush and scrub the spots and the collar and cuffs.

"I change the water frequently, always making the same solution, and giving much care to keeping the temperature even. I do not let the sweater cool. I work rapidly, and rinse it in water that is again the same temperature. Into the rinse water I put only two tablespoonfuls of soap solution. If woollen goods are rinsed in clear water they will be stiff, but a little soap will keep them soft and fluffy. I press all the water out by passing the sweater through wringer, then I wrap it in a towel and press it with my hand ... until ... been soaked out. I draw the sweater into shape by pulling the shoulders and sleeves to the width I desire; then I draw the front, back, and collar into shape, and baste the sweater on a sheet, and dry it in a room that is the same temperature as was the water. Many a sweater is ruined by cold or hot water, or by hanging it out in the cold. Keep the temperature even from the time you soak the sweater until it is dry. Then shake it or beat it until the air has passed through the wool, and it is fluffy and loose again.

"Woollen dresses, underwear, and other articles made of wool can be treated in the same way without shrinking. Of course, the careful housewife is anxious to have her articles all wool and of a color that can be satisfactorily washed. Plain gray, red, black, and blue sweaters will give far better results than will striped sweaters. Almost all deep colors will fade a little, but if the work is well done it will not seriously affect the looks of the garment if the color is even; but if the white stripes are dulled by water that is stained it is impossible to get them clear again."

DOWN AT THE BARN

Down at the barn I've got a box in which I keep bolts and scraps of iron that might be utilized for repair purposes. Say ,it comes in mighty handy oftentimes.

Down at the barn I've got a place to hang all the harness. Just nailed up a strip across the tow-by-fours and drove spikes into them. Find it better than throwing the harness ou the floor.

Down at the barn I've got a box for hammer, hatchet, and nails. Don't have to look al lover the place for the nails or something to drive them with. Mighty handy when you are in a hurry.

Down at the barn I've got a lot of rivets and everything just ready to mend a broken piece of the work or buggy harness.

Down at the barn I've plenty of axle grease for the wagon and buggies, and some washers handy to keep wheels from rattling.

Down at the barn I've a ball of binder twine ready to use when I need strings for sacks or any other purpose.

Down at the barn I've got the surrey shedded from all the rain and the hot sunshine. Haven't had the tires tightened for six years. They don't need it.

Down at the barn I have a cozy stall for every horse and cow. Makes a fellow feel good when the storms are sweeping cold nights.—W. D. Neale.

All infertle eggs replaced free of charge

R. R. BLACK, "Elmhurst Farm," Oxford Junct., N.S.

R. O.M. and R. O. P. Holsteins

Would you like to get a good foundation? Holsteins of this calibre are seldom offered at any price, but we are overstocked and will offer::—

2 Daughters of "Ruby Nig" whose 7 day record is 567 lbs. milk, 25.60 lbs. butter; yearly record, 16,555 lbs. milk, 750 lbs. butter; the second highest record in Canada at 3 years of age.

2 Daughters of "Black Rose Beauty" whose record is 522 lbs. milk, 24.60 lbs butter in 7 days.

2 Daughters of Miss Rooker Posch, whose record is 402 lbs. milk, 16.114 lbs. butter in 7 days; 12,268 lbs. milk, 600 lbs. butter in one year, when 3 years old.

2 Daughters of Beauty Rooker, whose record at 2 years of age is 322 lbs. milk, 15½ lbs. butter in 7 days; 11,248 lbs. milk, 517 lbs. butter in one year.

And several others of equal breeding, sired by or bred to "Ida Rooker 2nds Vale," a sperior animal in every way and a proven producer of rich milkers. Also some extra nice bulls of the above breeding, all at reasonable prices.

BULL'S CREEK FARM

R. O. M. HOLSTEINS

All Bull and Heifer Calves advertised in previous issues sold. Present offering three good R O M. Cows now milking. If desired will be bred to my herd sire, (son of Woodcrest Sir Clyde the $2000 Bull.) Also a Yearling Heifer already bred

J. H. STOCKTON, BULL'S CREEK FARM, —WOODSTOCK. N. B.

ABSENCE OF MILK IN A MARE

"I bought a good six-year-old mare which I intended to keep as a brood mare. I bred her, and she is with foal. But lately I heard that she had two colts which she could not raise because she had no milk. When foaled the colts were strong and vigorous, but died three or four days after. When she foaled her udder did not enlarge only on one side, which enlarged about the size of the fist. Is there any treatment for her? Which is the best method to nurse a colt?"—Subscriber.

Answer: Agalaxia or absence of milk in the udder is not uncommon in animals; it is frequently met with in the mare and cow, especially in those that have not been bred for a long time, and in aged mares bringing forth their first young. In many instances it represents nothig more than a disturbance in the physiological function of the gland, but in others it forms a true diseased condition. In the former class some of the following causes may be responsible: Present congestion or inflammation of these glands, exhaustion from disease, severe labor, insufficient food either during or immediately after pregnancy, and emaciation. In some instances the milk gradually appears some time after parturition. These cases may be successfully treated by removing the cause and assisting nature with good nourishing food and such remedies as aniseed and fennel seeds mixed, and given in tablespoonful doses mixed with each feed. When due to some chronic pathological condition such as changed gland structure or atrophy of the mammae, or resulting from a previous disease of the udder, treatment is not likely to prove successful. The best way to raise a foal which has been deprived of its mother's milk is, if possible, to put it on another mare that may have sufficient milk for two colts—that is, providing she will take to the stranger. Another way is to raise it on cow's milk diluted with one-third water, with a little sugar added to sweeten. It should be warm and may be fed from a bottle. The colt should be taught to drink from a pail.

During the rush of spring work many horses are overworked. Let them rest a few minutes every half hour. It doesn't pay to get them overtired. Better be a little longer about the work han o have a sick horse.

What You Want.

A. STROUT FARM AGENCY, Dept. 2612, 294 Washington St., Boston, Mass.

HOW TO USE PRUNING SHEARS

Double cutter shears used in orchard pruning give good satisfaction when used upon limbs smaller than three inches in diameter. When care is taken to cut through the bark all around the branches to be removed, the wounds heal over much better than when the growing layer of bark and young wood is crushed by being squeezed from opposite sides without being cut around first. One caution is necessary in using this implement:

When making cuts of forking limbs, it is necessary to avoid bearing down because the main branch to be left is likely to split and a heavy load of fruit the following summer is almost sure to break the limb at this point. Effort should always be made to lift when making such cuts. Indeed, it is a good plan always to cut off the branch a foot or so beyond the point where the crotch is, and then to remove the stub with a second cut.—M. G. Kains.

QUERIES

Linseed Oil and Turpentine

Having seen in this paper many times linseed oil and turpentine prescribed for worms in the horse, I decided I would try it, with the result that it nearly killed my horse.—L. M. T.

Raw linseed oil and turpentine is, and has been for many years, the standard, simple remedy for worms, and any trouble arising in a case of this sort should be traceable to error in size of doze or method of administration, or perhaps to the fact that impure, bung-hole or boiled oil has been used. I suspect that the war may have a bearing on this question, and that one should be very careful to secure pure, raw linseed oil. The oil must be raw, not boiled.

Spider on Teat

I have a heifer with second calf that has one teat on the end of which a scab forms every time she is milked that has to be removed before the milk will flow, and then it spatters all about.—D. F. B.

This is a case of what is commonly called spider. Great care must be used in order not to carry the disease to other cows, and it will be safest to milk this one last. Twice a day the teat should be treated with carbolated vaseline—before and after milking. If it becomes necessary to use a tube, be very careful to disinfect it by boiling each time it is used, and before inserting it should be smeared with carbolated vaseline.

To Remove Warts

How can I remove warts from a cow's teats?—E. P.

There are two methods of removing warts. Those with a stem can best be removed by cording with a strong thread; to others apply strong nitric acid, being careful to get it nowhere but on the wart. Repeat the application as often as the dead portion falls off. Shivering of the legs may be due to nervousness, or possibly to soreness.

ANIMAL POISONS

Stock owners are often greatly puzzled to account for the strange disorders and deaths that sometimes take place among their herds. Most of the poisonous plants are becoming well-known, loco weeds, wild parsley, and horse tail being easily recognized. Another plant, not so well known, but poisonous in its nature, is St. John's Wort. The strangest thing about this plant is that its poison has no effect on dark-skinned animals, nor even on the black patches of animals with varied coats. Acute inflammation is set up on the white skin, which peels off and is seen hanging in rags, while the black remains unchanged. Sheep suffer through eating this weed. Their ears swell, and the eyes are so affected that blindness sometimes follows, and even death. Cattle as well as horses are affected by the poison. The white skin on their noses often cracks and peels off. Exposure to sunlight is necessary to develop the curious symptoms of this disease. If protected by shade an animal quickly recovers. It seems as if the herb sensitizes the skin so that some chemical rays, possibly outside the solar spectrum, set up the inflammation.

The St. John's Wort family is a large one, some two hundred species being found in Canada. Common St. John's Wort (Hypericum perforatum) was introduced from Europe. Its medicinal properties have been known since the time of the Romans, and in Italy today it bears a name which means "devil chaser," the plant having the supposed power to cast out evil spirits. A good illustration of this plant will be found in "Farm Weeds of Canada," but a peculiarity of the leaves enables any one to recognize it. If held up to the light what appear to be a number of minute holes are seen. These are not really holes, but oil glands or cells. With the aid of a magnifying glass some of these cells are seen to contain a purple coloring matter, which, on bruising the leaf, stains the fingers a purple color. The same effect is produced by crushing flowers between the fingers. This coloring matter has been named hypericum red, and much resembles an aniline dye. This poison has a depressing effect on the beating of the heart, very similar to that produced by the poison found in the fox-glove. The crown of yellow flowers, well supplied with stamens, may be seen in June and July. It should be avoided when making hay, for the plant's poisonous properties remain active even after being cut and dried.—S. J. Wigley.

Watauga, Pictou Co,, N. S.

DISKING THE OAT GROUND

Wishing to try the relative merits of single and double disking before sowing oats, I selected two strips of land in the same field last season, put on the same quantity of seed per acre, but disked one piece twice before seeding, the other only once. The yield of oats on the ground disked twice was considerably heavier—enough, I consider, to more than pay for the extra work. The seeding in each case was followed by a spike-tooth harrow which helped toward securing the ideal seed bed.

I note that some farmers who employ the double disking method of sowing do the seeding first. This is a mistake, as much of the seed will be covered entirely too deep. In double disking, one working is usually given crosswise of the other. While this is much preferable to a single disking, I have found lap disking a great deal better than either.

Let every other "round" reach just one-half way over the preceding round. This not only thoroughly pulverizes the soil, but the strip of ground directly between the two sections of the disk will be worked up more thoroughly than with cross disking. The ground will be much smoother, too, by the lap disking than cross disking, a valuable point in connection with harvesting the grain.—M. Coverdell.

HOME SOLDERING

I am sure a bit of economy I practice will be interesting. If one has been in the habit of running to the tinshop to have every basin mended when a hole appeared it is easy to save the trouble and mend your own tinware. Get ten cents worth of muriatic acid and five cents worth of zinc; take out of doors, pour the acid into an old china cup, cut up zinc, and drop into it; stand back while it spatters. When cool, pour into bottle again, and cork for use. Get a thin bar of solder, and if you haven't a soldering iron use the poker heated red hot. Then scrape around the hole you wish to mend until bright, and with a feather wet over spot scraped with the muriatic acid. Hold the solder over hole and melt it with the iron, and let it drop over hole and rub it over with iron to make flat and smooth. Small pieces of solder laid on the hole, then melted, answer nicely. If the hole is so large the solder runs through, set dish on roll of cloth to keep solder from running. Granite ware can be mended by making a sort of rivet of solder and melting it enough to clinch on each side. Of course, one wants something hard underneath to keep solder from dropping and to spread it.—L. N.

CARE OF TIRES

Automobile tires, like machines, should receive some attention and care before they reach the point of "laying down on the job." A little care in looking over a machine occasionally will prevent trouble, so will a close examination of tires while they are still in good condition enoble one to prevent much of the trouble to which tires are heir.

The proper use of the extra or spare tire which every autoist should carry will enable him to make such examinations and repairs at the proper time. At regular intervals the extra tire can be used to replace one of the service tires, and the one removed should be gone over immediately. All the cuts, cracks, and breaks should be sealed by vulcanizing, and the weak places reinforced. According to "Motor," if a car is in constant service, one tire exchange per week, and in rotation, will enable one to keep all the tires in as good condition as possible. Of course, this period depends upon the driver and condition of the roads travelled. By this arrangement the extra tire will be kept in good repair for emergency calls, with the emergencies reduced to a minimum, and in most cases the tire milenge will be almost doubled.—A. Cammack, Colorado Agricultural College.

MEND THE OLD BUCKETS

Usually a bucket wears out first in the bottom, and is nearly good as new otherwise. If bottom is too poor to solder, and still not valuable enough to pay for having a tinner put a new bottom in, it may be cheaply repaired by cutting a circular piece of board just the size of inside of bottom. Press it in tightly from top downward, and when in place nail fast to lower rim of bucket with small strong nails. A little coal tar or pitch put in around joint will help vessel to hold liquids.

Galvanized buckets are liable to crack along the seam. These cracks may be remedied by smearing coal tar or pitch thickly on the inside along the crack and pressing on this a piece of strong cloth. This will make an almost useless bucket of service in dipping water for stock or watering and setting out plants.—D. Z. Angle.

KEEP CYLINDERS CLEAN

The carbon that forms in the cylinders of automobiles is the residue left from burning gas and lubricating oil. The hard deposit is formed from lubricating oil. Do not keep too much oil in the crank case. In old motors use heavy oil. The carbon should be removed either by scraping or burning with an oxygen flame.

EXTRACTING WARBLES

To extract warbles, place the mouth of a quart bottle over the grub and press tightly to exclude the air; hold there until the grub pops out. This method works fine, and is not severe to the cow. A quart whiskey bottle works fine.

POISON IVY CURE

This is what we use in our family for a poison ivy cure: Tansy tea, made good and strong; wash affected parts frequently, and drink some three or four times a day Make it nice and fresh for every drink. It is blood cooling and purifying, and seems to make one less susceptible to the poison.

The farm of the rich man who carries on farming for the pleasure of it may teach us some things; but, ah, how much more encouragement and inspiration are found in the work of the farmer who started in a small way, and, against heavy odds, made a success of farm operations!

Rice Omelet.—Take 2 cops of steamed rice, as in 25 or 26, add 1 cup sweet milk. Beat up two eggs and add them to the rice, and pour into a hot buttered skillet. Do not cook too fast. About ten minutes' slow cooking will be sufficient. Fold half over and serve on a platter; garnish with wee green leaves from any plant.

A mixture of alcohol and ether, 3 parts each, and ammonia, 1 part, is effective in removing perspiration stains.

If you can do so, grow more live stock.

How to Produce Cream That Makes Good Butter

CLEAN SEPARATOR
PROMPT COOLING
FREQUENT DELIVERY

Good Cream
Good Butter
Reputatioa For Quality
Increased Demand
Top Market Price For Butter
Maximam Returns to Dairy Farmer

A recent bulletin by O. F. Hunziker and G. L. Ogle, of Purdue University, Lafayette, Indiana, entitled "How to Produce Cream that Makes Good Butter," contains so much timely advice on the subject that we reproduce it in full. Every word of it is applicable to Maritime Province conditions, and all you have to do while reading it is to substitute the words New Brunswick, Prince Edward Island, or Nova Scotia, as your case may be, for the word American.

Importance of Producing Good Cream

The farmer holds the key to the quality of the butter manufactured and the price received for the same. The market price of butter is governed primarily by its quality. Good butter which brings top market prices can be made only from good cream, and the quality of the cream in turn is controlled by the care it receives on the farm.

Influx of Foreign Butter Demoralizes Market of Inferior Grades

Under present market conditions the quality of butter affects its price more than ever before, i.e., the difference in price between first grade butter and second grade butter is very great. This fact is due largely to the increase of imports of foreign butter, made possible by the reduced tariff. Most of this imported butter is of good quality. This influx of foreign butter will be vastly greater after the conclusion of the European war.

In order to successfully meet this competition with foreign butter, and to preserve American markets for American butter, we must produce better butter; we must produce a butter equal in quality to that of the imported product.

Good Butter Stimulates Consumptive Demand

Good butter is an essential asset of the dairy business under any condition. Each pound of good butter sold increases the consumptive demand of butter. Quality is the most effective advertising medium; in fact, it is an absolute necessity for the permanency of the business. The better the quality of butter the greater its consumption; the more brisk and the more favorable the butter market, the larger the returns. Quality is also the only really effective means to successfully compete against butter substitutes.

The Dairy Farmer Controls the Quality of Butter

The dairy farmer, the producer of milk and cream, controls the quality and price of butter. If he furnishes cream of good quality he makes possible the manufacture of good butter, which will command the highest price on the market. If he supplies cream of inferior quality, a low grade butter is bound to be made from it, which means small returns for the product.

The dairy farmer is the controlling power which determines the destiny of the dairy industry. The care he gives the cream on the farm determines the financial returns from the butter; and, in turn, the returns from the butter determine the prosperity of the dairy farmer, because the price the creamery pays for butterfat is necessarily largely regulated by the price the butter brings on the market.

Lack of proper care of milk and cream on the farm, and the resulting poor quality of cream, therefore, will augment the depression of the butter market and stimulate the sale of foreign butter and butter substitutes, causing low prices to the creamery and small returns to the farmer. These unatisfactory conditions can be overcome by proper attention to the quality of the cream on the farm.

How to Produce First Grade Cream

Every farmer in the state can produce first grade cream by reasonable attention to the following simple and fundamental principles: Cleanliness of separator, promptness of cooling, and frequency of delivery.

Clean Separator

The separator is the collector of many of the impurities contained in the milk. If cream of good quality is to be secured it is obvious that the separator must be cleaned thoroughly after each separation. If not washed and freed from all remnants of milk of the previous separation, the separator becomes a seat of contamination and a source of unclean and filthy cream, the disastrous consequences of which no subsequent treatment and care of the cream can overcome.

This does not mean that no attention should be paid to cleanliness and care of milk before separation. Milk produced under unsanitary conditions will not produce good cream, even if passed through a clean separator. In the production of good milk, clean stables, clean cows, clean milking, and clean utensils are essential; but all these precautions come to naught unless the milk is run through a clean separator; and experience has shown that it is this negligence in the care of the separator that has done more harm to the quality of the cream than any or all of the factors entering into the care of the milk before separation combined.

How to Keep the Separator in Sanitary Condition

Wash the separator after each separation. Immediately after separation, flush the separator with water until the discharge from the skim milk spout is clear. This removes most of the remnants of milk and cream, and loosens the separator slime in the bowl, making subsequent washing easy. Now take the bowl apart and wash with hot water containing some good washing powder, all parts of the bowl, discharge spouts and buckets. Then rinse them with scalding hot water and allow all parts to drain in a clean place. All other milk utensils should receive the same treatment. Do this after each separation.

Other advantages of a clean separator: Aside from insuring cream of good quality, a clean separator will skim more closely and last longer than a separator that is not thoroughly washed after each separation.

The slime which accumulates in the bowl reduces the space in which the milk is exposed to the separating influence of the centrifugal force. The separating efficiency is therefore diminished and more fat is lost in the skim milk.

If the bowl is not washed after each separation the impurities and acid formed in it, due to decomposition of the remnants of milk, tend to corrode the bowl and internal contrivances and to shorten the life of the separator.

Proper Cooling

Cool the cream immediately after separation by setting the can in cold water. The spoiling of cream, as well as the decomposition and putrefaction of other food stuffs, is caused by germ life, bacteria, yeast, and molds. Like other living organisms, germs require warmth to thrive. In the absence of warmth they are inactive and are unable to continue their work of destruction.

When the cream comes from the separator it is warm and in ideal condition for bacterial decomposition and spoiling. If it is cooled promptly the activity of the bacteria is checked and the cream will keep sweet for a reasonable length of time. The lower the temperature to which it is cooled the longer it will keep in normal condition. Cooling to the temperature of the water available on the average farm alone greatly retards bacterial action and prevents spoiling. Cream should be cooled at once after it leaves the separator.

Prompt cooling is not possible by merely letting the cans stand in the air. Air is a very poor conductor of heat. The cans must be set in water. Water cools cream about thirty times as fast as air.

Set the cream cans in a trough, tight box, tank, or half barrel containing water. If cooling water is available, let the water run through the tank continuously; if not, fill the tank up with fresh water at least once every twelve hours. If the cooling tank is connected with the stock watering trough, the water needed for the stock serves to cool the cream by running through the cooling tank first.

Do Not Mix Warm Cream with Cold Cream

Stir the cream frequently to hasten the cooling and to keep it in smooth condition. Do not pour warm cream into cold cream; this practice spoils the whole batch. Cool the warm cream in a separate can before mixing. The dairy supply houses are now putting on the market cooling tanks which provide for two cans for this very purpose. If you cannot conveniently make your own tank, or have it made locally, ask your creamery to secure a tank for you, or write to any reliable dairy supply house.

Other Advantages of Prompt Cooling by Setting Cans in Water

Aside from checking fermentation, and therefore avoiding rapid spoiling of the cream, the use of the cooling tank serves to take the animal heat out of the cream, preventing the cream and butter from developing an unpalatable smothered taste, which greatly depreciates the market value of butter.

When promptly cooled and frequently stirred the cream remains in proper mechanical condition so that it can be readily transferred without excessive loss due to sticking to the can. This also makes possible the taking of representative samples therefrom, which in turn insures accurate tests. One of the fundamental causes of irregular and incorrect cream tests lies in the poor mechanical condition of the cream when sampled. It is difficult to take a correct sample from cream that has not been cooled promptly and properly, nor stirred frequently, or that is otherwise in poor condition.

Frequency of Delivery

Cream is a highly perishable product. Like other similar products, it is best when fresh, and should therefore be marketed as early as possible. Age will deteriorate cream under any condition. While proper care retards such deterioration, it cannot entirely prevent it; hence delivery should be made often, preferably three times per week in summer and twice per week in winter.

The Proper Richness of the Cream

Adjust the cream screw of the separator so as to secure cream testing about 35 to 45 per cent fat. Low-testing cream sours and spoils more rapidly than high-testing cream, so that by the time it reaches the creamery it is often in condition unfit to be made into good butter. In the spoiled and curdy condition, it also

Cabbage Root Maggot and Its Control in Canada

Phorbiabrassicae Bouche

By Arthur Gibson, Chief Assistant Entomologist, and R. C. Treherne, Field Officer

In spring when cabbages and cauliflowers are set out, or when radishes, onions, beans and other plans appear above the soil, small flies, somewhat resembling the common house fly, but rather smaller and more slender, may be seen flying about close to the ground, depositing small, white, elongated eggs on the stems of the plants or adjacent thereto. These eggs hatch in a few days and the small, white maggots at once burrow down and destroy the roots. In the case of the Cabbage Root Maggot, there are three or four generations during the season. The Imported Onion Maggot also has several generations, and injury by these species may continue from May until autumn. The chief damage is effected in May and during June. Early grown crops are particularly attacked, some seasons whole fields of these being entirely ruined. Injury by the Seed-corn Maggot is largely confined to the seedlings of such plants as corn, beans and peas. The annual loss caused by these insects in Canada amounts to many thousands of dollars.

The larvae of the above three species, which are popularly known as root maggots, are similar in appearance, being whitish in color, rather blunt at once end and pointed at the other end, and when mature are about one-quarter to one-third of an inch long. It is in this stage that the insect is destructive and known to the farmer or vegetable grower.

Several important parasitic and predacious enemies prey upon the root maggots, but these unfortunately cannot be relied upon to control outbreaks of these insects, and therefore artificial methods of control become necessary.

Among the artificial methods, the screening of seed beds to prevent the female flies gaining access to the plants to deposit their eggs is important. Cabbages and cauliflowers when transplanted in the field may be protected by placing around the stems a disc made from one-ply tarred felt paper. In small gardens applications of decoctions of white hellebore, pyrethrum insect powder, or of a carbolic wash mixture have been found of value. Under field conditions the protection of such crops as onions, turnips, corn, peas, and beans from the ravages of root maggots have proved to be a difficult problem, but recent experiments with poisoned baits to destroy the Imported Onion Maggot Fly have been found to give much promise.

Fall plowing and rotation of crops while, of course, being excellent agricultural practices, have their limitations so far as the control of root maggots is concerned; such cultural methods, however, as soil cultivation and the use of fertilizers undoubtedly assist considerably artificial control measures. Owing to the fact that root maggot flies are known to lay their eggs on stable manure it is advisable, in spring, to avoid the use of such fertilizer as much as possible.

Introduction

Among the destructive root-infecting insects of importance to the farmer and vegetable grower, the Cabbage Root Maggot (Phorbia brassiace Bouche), the Imported Onion Maggot (Hylemyia antiquo Mg.—Phorbia ceparum Mg.), and the Seed-corn Maggot (Phorbia fusciceps Zett.), easily take first rank. The Cabbage Root Maggot, often referred to as the Cabbage Maggot, the Radish Maggot, or the Turnip Maggot, attacks freely plants of the Cabbage Family; the Imported Onion Maggot feeds early in the season on that portion of the onion plant below the ground, and later bores into the bulbs; the Seed-corn Maggot infests the seeds and seedlings of corn, beans, and peas, and occasionally attacks cabbage, radish, and a few other plants.

Fields of the above mentioned crops have, in certain seasons, been completely destroyed by the ravages of these root maggots. As such injury is so well known to farmers and market gardeners it is unnecessary to refer in detail to the enormous annual losses in Canada caused by these destructive insects. Suffice it to say that as a class they are of decided economic importance.

Historical

Injury by root maggots has been known in Canada for many years. The Cabbage Root Maggot, the Imported Onion Maggot, and the Seed-corn Maggot are all of European origin. It is not known definitely when these insects reached Canada. The Cabbage Root Maggot, Phorbia brassicae Bouche, was first recorded in the United States in 1835. In 1875 Couper reported that the Imported Onion Fly, Hylemyia antiqua Mg., was a terrible pest to the onion growers throughout the extent of the Dominion and that another species had been destroying cabbages in the neighborhood of Montreal, Que. This report undoubtedly referred to the injury caused by the Cabbage Root Maggot. It was not until 1885, however, that the ravages of the latter insect in Canada attracted wide-spread attention. In that year Fletcher stated that it destroyed from 25 o 75 per cent of the cauliflowers grown. There can be no question that both the Cabbage Root Maggot and the Imported Onion Maggot were present in injurious numbers many years previous to 1875, otherwise these insects would not have become so well established throughout Canada. The adult of the Seed-corn Maggot, Phorbia fusciceps Zett., was recorded, from Martin Falls, Ont., and the Province of Nova Scotia, in Walker's List of Diptera in the British Museum, Part IV, the title page of which bears the date 1849. It was not, however, until 1885, that injury by the larvae attracted attention. In that year Jack found the maggots at Chateauguay, Que., causing much loss in a field of golden wax beans. Fortunately, this maggot is not a regularly occurring pest, but in years of abundance much damage takes place, particularly to corn and beans. This species also occurs in every province in Canada.

The Cabbage Root Maggot
Phorbia brassicae Bouche

Life History—The Egg

Description.—The egg is very small, but easily seen on the plants or on the soil near them. In length it is about 1 mm. (one twenty-fifth of an inch) curved in outline on one side; in color white, with distinct ridges; in shape cylindrical, pointed at one end and rather blunt at the other. On one side of the egg there is a distinct grove which is wider and deeper at the blunt end.

Duration of Stage.—Full and complete records on the duration of the individual egg stage and the degree of egg fertility have been obtained during the course of study of this insect. The following table represents these two points arranged on the basis of an examination of 2,113 eggs as studied at Agassiz, in the Province of British Columbia. Inasmuch as these records were obtained from a consecutive series of experiments carried over the entire summer of 1915, at Agassiz, B. C., involving all possible generations they are mentioned here in preference to similar records obtained at other points in Canada. From a study of the duration of the egg stage it is clear that the period varies from three to five days, on an average, and this finding appears to coincide with available records in eastern Canada and in the United States.

Table I—Summary of the duration of the individual egg stage and the degree of fertility, Agassiz, B. C., 1915:

Period	Number of eggs Studied.	Average Number of days required to Hatch.	Per cent Fertility.
April 19-May 7 ...	261	4.87	88.2
May 21-May 31 ..	66	4.90	83.6
Month of June ..	371	4.70	85.0
Month of July ..	709	3.80	84.0
Month of August.	380	5.03	89.9
Month of Sept. ..	326	4.80	91.0
	2,113	4.7	86.9

From this we assume that the egg stage last on the average 4.7 days, and that the high egg fertility record is maintained throughout the summer, possibly, it would seem, even increasing with the advance of the season. All eggs do not, however, maintain such an even degree of hatching as the above table indicates. In our observations it was noted that the egg stage lasts on the average 4.7 days, our study indicated that

1.9 per cent hatched in 2 days
3.7 per cent hatched in 3 days
16 per cent hatched in 4 days
25.8 per cent hatched in 5 days
45.6 per cent hatched in 6 days
6.1 per cent hatched in 7 days
0.4 per cent hatched in 8 days
0.5 per cent hatched in 10 days

All these above records were obtained under supposedly ideal conditions; that is to say, from eggs hatched on slightly moistened blotting paper in vials under ordinary atmospheric conditions. Uniform incubator temperatures from 27 deg. C. to 30 deg. C. gave a variable hatching, also, from 3 to 5 days. To determine to what extent a variation may occur in the percentage of larvae hatching from the eggs, 509 eggs were kept under observation under ideal conditions, such as those just mentioned, in comparison with perfectly dry conditions as would be obtained on dry blotting paper in vials. The following results were noted:

258 eggs kept under moist conditions:
Average number of days required to hatch 3.7
Per cent hatched .....95.
251 eggs kept under dry conditions:
Average number of days required to hatch 3.3
Per cent hatched .....50.

The average of 50 per cent noted under dry conditions, we think, however, is rather high, our experiments, at Agassiz, B. C., indicating that exceptional high temperatures decrease the percentage of eggs which hatch.

The Larva

Description.—The mature or full-grown larva is about 8 mm. in length (one-third of an inch). It is whitish in color, flattened at one end and tapering to the other or head end. The segments are distinctly divided. At the blunt or caudal end are 12 fleshy tubercles, the pair nearest the centre being larger than the others, and each bearing two points, which are dark in color. In the centre are two conspicuous, raised, reddish-brown spiracles. In comparison with the Imported Onion Maggot the caudal end is more flattened and abrupt. From the head project a pair of black, hooklike mandibles or jaws. A short distance from the head on either side is a fanlike process; these are the spiracles and communicate with the tracheae, or "air tubes."

Duration of stage.—Obviously the question of the length of the larval stage is of great importance in its practical relation to the injury that the larvae effect, on account of the fact that the damage to crops by this insects is only brought about in the larval form.

Those who have studied this insect in the United States and in Europe state that the length of the larval stage lasts from three to four weeks. This corresponds with our records in Canada, which indicate that the larval stage varies between 19 and 32 days. It will not be necessary to detail our notes in this connection, as the duration of the individual stage seems thus well established. It is more important to determine the feeding life of the broods of larvae as they occur, for it is not the individual feeding action that causes such havoc, but the concerted action of many larvae over a considerable period of time.

Pupation.—When the larva has become full grown, having completed its feeding, it seeks a suitable position in which to change to the puparium stage preparatory to the emergence of the adult fly.

The puparium may be either imbedded in the tissues of the root where the larva completed its feeding or close to the root in the wet soil produced by the feeding of the maggots, or, again, the larva may migrate and pupate some distance in the adjoining soil, possibly as far as 4 or 5 inches from the roots.

The place of pupation in the soil, however, may vary considerably according to the depth of feeding. In our investigations at Ottawa, Ont., we found the over-wintering puparia at depths in the soil varying from 1 inch to 9 inches. In April, 1914, 146 puparia were removed from the soil. The following table indicates the percentage of puparia found at various depths:

Table II—Showing depth of puparia in soil:

Depth in Inches.	Percentage of puparia.
1	4.26
1¼	2.73
1½	3.41
1¾	1.36
2	6.16
2¼	6.16
2½	6.16
2¾	0.68
3	14.38
3¼	3.41
3½	7.53
3¾	4.26
4	11.98
4¼	0.88
4½	12.32
4¾	3.41
5	6.55
5¼	0.68
5½	2.05
5¾	0.00
6	0.00
6¼	0.00
6½	0.68
6¾	0.68
7	0.00

7¼	0.00
7½	0.00
7¾	0.00
8	0.68
8¼	0.00
8½	0.00
8¾	0.00
9	0.68

From observations made in the spring of 1914, there is evidently no constant position in which the larvae pupate. Puparia were found in all positions, from vertical to horizontal, at varying depths.

From experiments conducted by Washburn in burying puparia at different depths, it was surmised that the flies were not able to penetrate through six inches of soil under as near natural conditions as possible. In experiments, however, conducted at Ottawa, Ont., flies emerged at the depth of nine inches, as shown in the following table:

Table III—Showing emergence of flies from puparia buried at different depths:

Date collected, May 1.			
Number Puparia.	Depth buried in inches.	Number Emerged.	Per centage Emerged.
15	4	6	40
10	5	5	50
20	9	5	20

In the above experiment at Ottawa the puparia were placed in large open-mouthed jars on 1½ inches of earth. The puparia were then covered with soil to the depth stated in the table, which soil was packed tightly by jarring. From this experiment, and also owing to the fact that we have found puparia in the field 9 inches beneath the surface of the soil, we are justified in concluding that the adult flies are able to penertate to the surface from such depth and develop.

The Puparium

Description.—The puparium, within which the maggot changes to the adult fly, varies from light to dark reddish-brown in color. In length it is from 5 to 6 mm. (one-quarter of an inch), although some puparia are frequently found of shorter length. The puparium, which is simply the hardened contracted skin of the maggot, retains the tubercles which occurred at the blunt end of the larva. It is, therefore, usually possible to determine the insect from this character.

Duration of stage.—The length of time the insect remains within the puparium during the summer varied in individual experiments conducted at Agassiz, B. C., from 15 to 18 days. The duration of the puparium stage, however, as shown by the following table, far exceeds this latter period.

Table IV—Indicating the length of puparium stage during summer and autumn:

	Number of days.
July 6—Number of puparia under observation, 84; Dates of fly emergence, July 10—July 26	4—19
July 21—Number of puparia under observation, 80; Date of fly emergence, August 5—August 27	5—27
August 27—Number of puparia under observation, 70; Dates of fly emergence, August 28 to September 25	2—30
September 1—Number of puparia under observation, 75; Dates of fly emergence, September 8 to September 25	8—26

It may readily be supposed that puparia formed in close proximity to the surface of the soil, in more direct contact with the rays of the sun during the summer months, would produce flies sooner than puparia deep in the soil away from such temperature influences. Further, there are indications that there is a marked difference in the length of the puparium stage in the spring and summer as compared to late summer and autumn. In the late generation which passes the winter in the puparium stage there is a marked difference in the dates, in the following spring, at which the flies emerge. From puparia collected in the field at Ottawa, Ont., on April 25, 1914, flies emerged in the outdoor insectary from May 20 until July 6. In the field, however, the adult flies have been observed earlier than this at Ottawa, and as early as April 8 at Agassiz, B. C. In our insectary at the latter place no flies emerged from puparia after September 27, although until this date the flies had been emerging freely from puparia collected in that month. Indicating the marked difference of climate at Agassiz, B. C., and Ottawa, Ont., in March, 1915, it may be here stated that at Agassiz the monthly mean temperature was 41.02 F., and at Ottawa 19.36 F.

The Adult

Description of the Male.—The male fly is about one-quarter of an inch in length from the tip of the head to the end of the abdomen, the body and legs being of a dark ash-gray color, and rather thickly covered with black bristles. On the back of the thorax, the central portion of the body to which the two wings are attached, are three blackish, rather broad bands, the central one of which continues along the back of the abdomen. The eyes, which nearly touch each other in this sex, are of a reddish-purple color. At the base of the femur (the upper portion) of each hind leg there is a conspicuous cluster of rather long bristles, and this is a character which is used to separate the male of this species from the male of closely allied species.

Description of the Female.—The female fly is in general appearance much the same as the male. It is of a lighter color, and the eyes are rather widely separated. The abdomen is shaped differently from that of the male, being slightly longer and pointed at the end.

Duration of Life.—A series of experiments were conducted at Agassiz, B. C., to determine the average length of life of the adults, with results given in the following table.

Table V—Length of the life of individual flies:

Emerged.	Number of adults.	Average length of life in days.	Variation in length of individual life.
June 26-July 1	62	3.5	2— 5
July 10-July 26	53	4.8	2— 7
July 16-July 24	11	4.3	3— 7
July 17-July 28	33	6.2	3—10
Aug. 5-Aug. 25	57	5.9	3— 9
Aug. 28-Sept. 27	92	9.0	7—25

The above table would indicate that the length of the life of the individual adult increases as the season advances. The question as to whether the length of the life may be prolonged by feeding the flies with sweetened mixtures does not indicate that life may be extended very much over adults deprived of food, hence the table given is a compilation from results from flies both fed and starved after emergence.

The proportion of sexes.—It is interesting to note that, in the study of the Cabbage Root Maggot at Agassiz, B. C., of 408 adult flies reared, 197 were males and 211 females. This gives a percentage of 51.7 females and 48.3 males. There are no indications that there is any increase in either one sex at any period during the season.

Recently Mr. E. O. Essig, in his work on Injurious and Beneficial Insects of California, 2nd Edition, 1915, refers to the fact that the species of root maggot in California previously recorded by him as Phorbia brassicae was in reality Phorbia planipalpis. Mr. Essig bases his statement on the authority of Dr. J. M. Aldrich.

Wanned---A New Type of Author.

Editor The Maritime Farmer:

It is refreshing to note that there is an ever-increasing tendency on the part of Educationists to reconstruct the courses of study for the rural schools. That this reconstruction is vital to the highest interests of our rural population there can be no doubt. For many years the type of education attainable by the country boy was that which leads to a university course and professional life. The learned professions have now become overcrowded, while many of our farms are left vacant. The conclusion we draw from this state of affairs is that there have been many who have left farm life who should never have done so. That they did leave was not altogether their fault, for in addition to the course of study which was forced upon them in their youth, they probably had it dinned in their ears day after day that the only sure avenue to riches and a life of ease and comfort was through the learned professions. The successful men and women they had ever read about invariably left the farm, went to the city, and became famous. As for any person ever remaining in the country and becoming rich and happy—why, who ever dreamed of such a thing?

It thus happens in most cases that the country boy is from his earliest childhood seriously handicapped through his whole life. True, he learns enough arithmetic to prevent his being cheated in a bargain. He learns a little geography of an abstract nature. His history and literature have been served up in sugar-coated form for examination purposes, their real significance and utility being something unheard of. As for the nature and cultivation of the soil, the raising of live stock, and other features of his home surroundings and life-work, these are left out of the discussion, except, perhaps, as a topic for a reading lesson or to supply a poetic sentiment for a song. To undertake the consideration of the labor on a farm from a practical and scientific standpoint would necessitate the soiling of one's hands, and no person of culture would ever be guilty of that! True, George Washington chopped down a cherry tree, and Gladstone once a year stooped to cutting a full-grown oak, but that was done for advertising purposes, and doubtless to catch the popular vote at the next elections!

Under these circumstances, what wonder is it that the average school boy rejoices when he reaches the day that will enable him to throw his school texts into the attic and forget his past drudgery!

After leaving school there are many boys who are unable to at once carry out the evident aim of their educational career and start at once for the city to make a living. In addition to remaining at home, he must be given some pleasant diversion for his spare time. What better recreation for the long winter evenings can be suggested than reading an interesting and instructive book? But he has no taste for literature, because it was not taught him with the aim in view of developing an appreciation for what is best in this field. Supposing he try history. Here again we find that this book occupies the remotest and darkest attic recess, for of all subjects which were inflicted upon his innocent boyhood, surely history cramming was the most detestable. His mind then must surely turn to fiction. Perhaps he will select something from the Sunday School library. In that event, he will find all he wants of the "goody-goody" type so well suited for sickly girls and old maids. There seems really very little left except the adventure series and the popular novel. He will greedily devour anything that gives his mind diversion from the humdrum of farm work and will spend many hours learning the oft-repeated fact that every successful man of the past (and therefore of the future as well) in case he was so unfortunate as to have been born in the country, invariably left his oppressive and unendurable surroundings and became rich, famous, and supremely happy in the city. This type of character thus becomes the hero the boy consciously or otherwise worships. It follows on the teaching he received while at school. It therefore must be true to real life.

If, on the other hand, he turns to the popular novel, he will learn of life within kings' palaces and the homes of the rich who fawn upon royalty. He will learn that there is a deal of truth in these tales of snobbery, and that many of the titled nobility have had their honors bestowed upon them, not because they have in any way contributed to the development of national greatness, but solely because they became possessed of immense wealth. This wealth was made in the cities in practically every case; hence the city is the place to go in order to attain fame and fortune.

What is sorely needed is a series of books of an interesting nature which will be an inspiration to the country boys and an incentive for them to remain at home upon their farms. This line of fiction should teach that all work is honorable and that effort skilfully applied in farm work will reap as great a reward as work as conscientiously performed in the city. In a word, we need a new type of hero who remains away from the allurements of the cities and becomes very successful on the farm.

Prof. Suzzallo, President of Washington State University, is authority for the statement that we may expect in this conutry a war every thirty years. The reason assigned is that the literature supplied our young people is so full of military heroes, and our histories deal almost exclusively with wars and their slaughters, that it becomes part of human nature to think and gradually to act in terms of military glory. How different if our youths were taught history from the standpoint of the great struggles for political and religious liberty! How differently would the coming generation prize the dearly-bought freedom handed down to us from our ancestors! If such truths were as thoroughly instilled in the minds of the young as the bloody deeds of the great warriors now are, what a different outlook we would have. Grafters would disappear from our houses of parliament because they would not dare face an enlightened electorate. Farmers would receive as much—yea, far more—consideration than at present is shown to manufacturers, already grown abnormally rich from the labor expended on the farms. Conditions would soon become so equalized that there ought not to be any distinction between the man who honestly earns his livelihood on the farm and the man who sits in his business office. The country boy would come into his just inheritance. He would be happy with his lot in life and would not exchange places with princes in their palaces. The signs of the times surely point toward this desired end. Who will help to hasten its advent?

TEACHER, N. B.

The big fly traps are very efficient in the stables. Place one on the back porch and several in the barns and stables. Five or six are none too many for most farms. Make them 15 inches square and 30 inches high if you cannot buy them.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

December	5—19

VALUE OF OPTAMISM

An optomist has been described as a man who can make lemonade out of the "lemons" which are handed him. He is a man who remains cheerful, hopeful, and courageous in the midst of any setbacks which fate may bring to him.

The spirit of optimism is a very valuable asset to any one. The pessimist is discouraged when he encounters difficulties or setbacks; he quits and tries something else. The optimist looks back over the history of his previous actions in the hope of finding out wherein he was at fault, where he himself was to glame in such a way as to at least help bring these troubles on himself.

Thereby he strengthens himself for meeting similar difficulties in the future. His failures and difficulties are the very material out of which he builds up his future success. He snatches difficulty out of defeat. He is an asset to his community and to his country.

Right now is the time for the optimists among live stock breeders to make lemonade out of the lemons which have been handed them by the foot and mouth plague. The pessimist will quit raising live stock. But the optimist will go ahead with greater care and precaution than he ever used before. He will take all possible precautions to see that his stock do not again become affected with this plague. He will use equal care to make certain they do not become infected with anything else. He will continue his breeding, but with greater care. The dropping out of the business of the pessimists, coupled with the increased demand for our live stock, will give him a greater market than he has ever had before for his animals, so that he should make greater money from his activities in future years than he has in the past.

Grit your teeth and become an optimist.

PREVENTION IS THE BEST CURE

If you want to protect your oat crop from the ravages of smut this year, you should give your seed the formalin treatment before you sow it. If you want to protect your potato crop from the ravages of scab, you should do the same thing before you plant the seed.

This treatment requires the expenditure of a little money—not very much—and a little extra labor and inconvenience. But it is certainly worth while to go to this expense and trouble when you consider what it means to you in the way of increased income from these crops. If you do not believe it, try it. Sow a part of a field of oats with properly treated seed. Sow the rest of it with untreated seed. Then, after the oats have headed, go into the field with a barrel hoop. Toss it into a porition of the treated field, count the total number of stalks inside the hoop, and the number which are damaged. Do this three times in different places in this part of the field, and figure up what percentage of the crop has been damaged by smut. Do the same thing in the untreated part of the field and figure up the percentage of damage. Then sit down with a pencil and a sheet of paper and figure up how much increase in the yield of the field there would have been had you treated all the seed sowed instead of only a portion of it.

Perform this experiment once, and there will never be any question in your mind about the advisability of treating your seed. Do it just once, and you will never again sow untreated seed.

COST OF BAD ROADS TO THE FARMER IS STAGGERING

Farmers have begun to figure the matter of roads a little differently than in former years. When the good-roads movement was in its infancy they used to ask themselves, "How much will good roads cost me?" Thanks to the intelligent propaganda of the daily and farm papers, as well as other agencies, farmers are now asking themselves, "How much are bad roads costing me?"

According to government experts, the cost of hauling a ton of farm produce a mile varies from seventeen cents, in localities where fairly hard gravel roads exist, to thirty-five cents per ton in parts of the country where the roads are in bad condition. On the other hand, in those European countries where hard roads prevail, the cost is as low as nine cents per ton per mile. The United States Department of Agriculture has estimated that the total haulage expense to American farmers for a year is approximately $500,000,000. And every dollar comes from the farmer's pocket, for he is the one great producer who cannot add the haulage expense to his wares, for the prices he gets are on a delivered basis.

If every farmer would take pencil and paper, figure the amount in tons of the produce and stock he markets in a year, multiply it by the number of miles he must haul it to market, multiply the total by twenty-five, which is about the average haulage cost per ton per mile, and then consider that he could save nearly half of this amount every year if he had an improved road all the way to his market, he would become an earnest good-roads worker.

A NEED IN RURAL EDUCATION

One obvious result of the heavy enlistment for active service of young men from the rural communities will be the necessity of taking from the rural schools boys from 11 to 14 years of age to help on the farm. In these times of sacrifice every individual must participate, and the school boy who can be of any service on the farm must "do his bit," irrespective of what his aims or aspirations may have been toward obtaining a higher education.

In all probability this break in the educational career of these boys may mean that dozens of them will never again resume their regular studies in a public or high school. Perhaps nothing is more humiliating to the sensitive, ambitious boy than to be placed in the same grade with boys and girls much younger than himself, while his previous girl classmates have advanced to higher grades. This position has caused many a farm boy to discontinue his education in the rural school.

But what assistance can we offer these boys who have already acquired a taste for education? Undoubtedly some system of correspondence courses meets the situation most satisfactorily; in fact, never before have we faced conditions where correspondence courses were in appreciable demand. This is a fruitful phase of educational work which our agricultural colleges, business colleges, and other educational institutions may well consider as a necessity of the immediate future.—Nor' West Farmer.

GOOD FENCES ESSENTIAL

It is a great handicap to farm without good fences. If they cannot be relied upon they are a source of constant worry. If there is a weak place in one of them the stock will find it sooner or later, and will break through into the adjoining field, where they will destroy a good portion of the crop; and the chances are they will overeat until their good health is impaired.

The building of fences is expensive, and it is always an economical practice to use none but the very best material—the most durable posts and a heavy, good grade of galvanized wire. While the first cost will be more when the best materials are used, the finished product will pay for the difference and will outlast two or three fences made of poor material.

Unquestionably, for general purposes, woven-wire fence should be given the preference by the farmer. There are numerous makes of this kind of fencing material, and nearly all makes can be had in a great variety of styles and grades. For the poultry yard, close-mesh wire netting in various heights is made; for fencing hog lots there is the new heavy wire fence with the lower wires close enough to keep the little pigs confined, and for general purposes over the farm there is the combination stock fence of different heights. Nearly all of these fences can be had in light and heavy grades, but in nearly every instance it is advisable to pay a few cents more per rod asked for the heavy wire fence. This kind will usually outlast by several years the lighter grades.

Our first duty is to win the war, and in this, economic production at home must not be lost sight of.

If there is any unemployment among able-bodied men in Canada this year, there is something wrong with the men.

Men who have risen from the ranks are becoming increasingly popular the world over, and generally they are most efficient.

RAISING PIGS ON PASTURE

With Supplementary Ration of Grain —Experiments in the United States

The increased price of grains necessitates a partial substitution of pasture in the breeding of pigs. The choice of grain to be fed in combination with pasture or forage depends on the nature of the pasture it supplements; when the forage is legume, such as alfalfa, clover, soy beans or cow peas, maize is perhaps the most economical cereal to use; but when the pasture is blue grass, sorghum, oats, rye, or rape, the ration should contain besides the maize some other high-protein feeds, such as oil meal, or meat meal, etc.

Experiments made at the Missouri Agricultural Experiment Station have proved that the amount of grain to be given is possibly of even greater importance than the kind of grain given for determining the economy of gains. Experiments conducted at different North American Experiment Stations have shown that even the best forage crops afford little more than a maintenance ration for pigs, and that to obtain an increase of live weight it is necessary to supplement with grain. Experiments show that the greatest economy in the cost of production is obtained by giving daily from 1½ to 2 pounds of maize for every 100 pounds live weight. As a general rule, a quantity of grain should be given sufficient to produce a daily increase of 1 pound for every 100 pounds of live weight.

Where alfalfa is easy to grow, there is no better forage for pigs. At the Missouri Agricultural Station the following results were obtained in feeding pigs with alfalfa and maize. One acre of alfalfa will feed during the grazing season from 25 to 30 growing pigs. The important point to observe is not to pasture too closely. The best results are obtained by pasturing so as to have two cuttings of hay during the season besides what is foraged by the pigs. One acre of alfalfa pastured 12 head for 168 days. The amount of grain fed amounted to half a full ration, and it required 3.07 pounds of grain to produce 1 pound increase of live weight; while with a ration of maize alone the quantity required was 5 or 6 pounds. The increase of live weight due to the forage was 597 pounds, which gave a return of $35.82, to which the value of two light hay cuts must be added.

At the Iowa Experiment Station alfalfa was pastured for 201 days, from May 7 to November 25, and gave the cheapest gains ever secured by any forage.

In 1911, in conjunction with a ration of maize cobs plus one-twentieth meat meal and swill, alfalfa gave live weight increase, when the price of maize was 50 cents per bushel, at a cost of $2.88 per 100 pounds.

Red clover ranks next to alfalfa as an excellent forage, provided it is not allowed to go to seed; conditions may be kept right by pasturing the proper number of hogs. Red clover will not support so many pigs to the acre as alfalfa, nor does it furnish forage for so long a period. In two trials at the Missouri Agricultural Station one acre pastured 11 head for 130 days, and the amount f grain required for 1 pound increase in live weight was 2.97 pounds (as a supplementary ration). In this case 572 pounds of pork, worth $34.32, were credited to the forage. The Iowa Experiment Station considers clover pasture one of the best rations available for fattening pigs on a full feed of maize.

Crimson clover sown in August and September gives abundant forage during the winter months and is largely grown along the Atlantic coast.

Rape may be considered to rank next to clover. It should not be pastured until it is from 12 to 15 inches high. With a moderate maize supplement one acre will feed 15 to 20 pigs. Experiments at various stations in North America give rape a feeding value of about $20 per acre. At the Missouri Station 1 acre of rape and oats pastured 10 pigs for 107 days. For each pound increase of live weight 3.28 pounds of maize were required, and the pork accredited to forage was 280.7 pounds—a return of $22.84 per acre. Throughout the greater portion of the Eastern and Middle Western States blue grass is well established and makes an excellent pasture for pigs if mixed with a plentiful amount of white clover. When permanent pasture is not available, a good plan is to sow a field with a mixture of grains. The writer recommends a mixture of oats, barley and spring wheat, in equal proportions, to which timothy and clover may be added. Also field peas drilled in April or early May, at a depth of at least 3 inches; with these, a week later, oats may be sown broadcast and lightly harrowed. When the pods begin to turn yellow the oats will be in the "dough" stage, and both crops will be ready for foraging at the same time.

Table I has been compiled from State and Federal reports, and is based on the experience and observations of the writer. The average weight of the pigs in this table is from 90-150 lbs.; pigs of a higher weight will consume a relatively smaller quantity of forage than will younger animals.

A solution of the problem of finding a combination of forage and maize feed to give the maximum of economy in pig-feeding is offered by the following results of experiments made at the Nebraska Agricultural Experiment Station (Bulletin 121). Pigs born in the spring and pastured on alfalfa were given supplementary rations of maize in varying proportions. The experiment was begun on July 25 and continued during 119 days, 30 with pigs in each group.

TABLE I—Pasture and Forage for Pigs

For foraging during:	Crops that may be used	Time of Sowing	Number of pigs per acre
April-May	Alfalfa	A previous year	8-15
	Rye	Preceding autumn	7-12
	Oats	March	6-10
	Rape	As early as ground can be w'ked	15-25
	Clover	Preceding season	6.10
	Blue grass	Preceding season or permanent.	8-12
June-July	Alfalfa	A previous year	8-15
	Oats	March or April	6-10
	Peas and Oats.	As early as ground can be w'ked	12-20
	Sorghum	April or May	20-30
	Rape	Early spring	15-25
	Blue grass	Permanent	8-12
August-September	Sorghum	April or May	20-30
	Soy beans	May	12-15
	Alfalfa	A previous year	6-10
	Maize	Early planting for hogging down	10-25
	Clover	Early spring or previous autumn	8-10
	Blue grass	Permanent	5- 8
October-November	Alfalfa	A previous year	8-15
	Rye	September 1	8-12
	Wheat	September 15	6- 8
	Rape	March to July	15-25
	Clover	April to May—second crop	6-10
	Pumpkins	At maize planting time	10-20
	Blue grass	Permanent	8-12
December-January	Both rye and wheat are sometimes available.		
February-March	Blue grass if not too closely pastured in spring.		

TABLE II—Results of pasturing pigs on lucerne and maize

	Group 22.	Group 23.	Group 24.
	Lbs.	Lbs.	Lbs.
Maize per 100 lbs. live weight	1.0	2.0	3.0
Average final weight per pig	101.0	120.0	171.0
Average initial weight per pig	42.0	42.0	42.0
Daily increase of weight per pig	0.5	0.65	1.08
Gain per 100 lbs. increase of live weight	132.0	220.0	336.0
Cost of forage per 100 lbs. increase of live weight	$1.05	$0.63	$0.28
Total cost per 100 lbs. increase of live weight	$2.16	$2.48	$3.10
Total profit per pig	$2.142	$2.499	$3.57

In establishing the prices given in Table II maize was valued at $16.78 per ton, and the alfalfa forage at five-tenths of a cent per head daily in group 22, at four-tenths of a cent in group 23, and three-tenths of a cent in group 24. This difference in the cost of alfalfa for the different lots was based on the amount of pasture consumed by each lot. The cost of the increase in live weight covers the cost of feed and of all the ordinary risks, but does not include labor, equipment, or interest on the investment. The pigs were valued at $5.90 a hundredweight on foot. As shown by Table II, the cost of production per unit of live weight augmented with the increase of the maize ration, but as the development of the animals was correspondingly more rapid the largest maize ration gave the biggest profits. The result is the same even when the price of maize is calculated at $23.20 the ton.

A similar experiment made under different conditions gave strikingly similar results. The writer fed different rations of grain to pigs born in the spring running on an excellent crop of oats and field peas. The supplementary ration consisted of barley, wheat, and a little meal, and the trial lasted 28 days. The supplementary ration was valued at $30 a ton, and the live weight increase at 8 cents a pound. The gross return per acre of oats and peas is obtained by subtracting the value of the supplementary ration from that of the increase in live weight, but without deducting the cost of growing the crop.

TABLE III—Results of Pasturing Pigs on Oats and Peas with Supplementary Ration of Barley and Wheat

	Group 2	Group 1	Group 4
	Lbs.	Lbs.	Lbs.
Supplementary ration: lbs. per cent of live weight.	1.0	2.0	3.0
Average final weight per pig	91.2	110.6	84.0
Average initial weight per pig	72.6	87.6	55.7
Average daily increase of weight per pig	0.7	0.8	1.0
Average total increase per pig	19.6	22.4	28.0
Gross return per acre, deducting cost of grain	$28.00	$33.06	$46.41

Since the liberal use of grain has proved profitable with alfalfal, it should prove more profitable still with pasture crops of less value. Frequently it may pay to feed grain where pigs are foraging off crops such as field peas, soy beans, and even small grains.

TIMELY SPRING TOPICS DISCUSSED

Practices That Promote Early Maturity in Grain

Lack of moisture causes low yields in dry areas and in dry seasons. Lack of heat (frost) causes low yields and poor quality on some heavy soils, particularly in the northern parts of Western Canada and in the more humid regions.

The practices that make the best use of the moisture are not necessarily the most desirable where fall frost limit the yield or quality. Some of the practices of "dry farming" are directly the opposite to those that are considered best in "northern farming."

All of the extreme dry farm practices should be followed only in southeastern Alberta, southwestern Saskatchewan, parts of southern Manitoba, and in some local relatively rock-free areas north of these parts. The man on the land must strive to learn, if experience has not already taught him, whether frosts are as much or more to be feared than drought. If they are, "dry farm" practices should be modified in one or more of the ways mentioned below.

Thick Seeding

As much as two and a half bushels of wheat and four bushels or more of oats is sometimes used on the heavy, rich, moist soils of the north. Of course, this is too much for any area or any soil where fall frosts are not feared. In the year 1911, when much of the western wheat crop was frozen, wheat seeded at two and a half bushels per acre on the University farm ripened ten days before the same variety sown at one-half bushel per acre. The yield and quality were almost much higher from the thickly sown crop.

Packing

Firming the soil either before or after seeding or even after plowing the fallow almost always results in an earlier crop. It may or may not be heavier. At Indian Head in 1909 barley crop packed twice after seeding ripened five days earlier than the same variety unpacked, and barley packed once after seeding ripened two or three days earlier than that left unpacked.

Early Seeding

It is not always the case, but the crop that is sown earliest generally ripens first. A field sown two weeks earlier than another will not ripen two weeks earlier, but it will ripen a few days earlier.

Press Drill a Help

The soil in the spring is warmer near the surface than further down. Yet seed must be put down to reach the moisture. A press drill will bring the moisture nearer the surface, where the soil is warmer, and thus encourage earlier maturity.

Less Frequent Fallowing

The fallow crop requires a longer time to mature than that grown on any other land. The less frequently

(Continued on page 617)

HORTICULTURE.

PROPER CARE OF SHADE TREES

By Carl Banwart, of the Newark Shade Tree Commission.

Examine your tree for points every month, and see what percentage it will have out of a possible one hundred. Each of the following, if answered unequivocally "Yes," gives your tree 8 1-3 per cent toward the one hundred. These questions are put in order of their importance.

1. Is the opening around your tree of standard size? Standard size is 4 feet square for a tree of 6 inches (or less) diameter; for every 1 inch increase of such diameter an increase of 1 square foot in area of opening.

2. Is the ground in this opening well loosened to admit air and water?

3. If the tree is surrounded by grass, is the sod open around the trunk?

4. Does the tree get a good proportion of the rain which falls on the sidewalk, or does the water run over the curb into the gutter?

5. Is the tree protected with a tree guard? Guard must be six feet high and not too tight. Tree must be protected from chafing by guard.

6. Is the tree free from borers? Borers can be deteced by sawdust coming out of holes in the trunk. Watch for the borers from April to November.

7. Are the trunk and the branches cleared of all cocoons, egg masses, larvae, caterpillars, beetles, scale?

8. (a) Is the head free from all dead wood, has it been pruned by an expert, and how do you know he is an expert? Find out how a tree should be pruned. Are all the cuts painted? (b) Does the tree stand perpendicular, and is its present place intended to be its permanent home?

9. Have the scars from horse bites or other injuries been cleaned out and painted to prevent harboring insects and to stop decay? If there are large cavities these should be filled with cement.

10. Does the tree remain green and in full leaf to the middle of October?

11. Have you put as much nourishment into the soil as the tree needs for the year? Give it a treat: dig in wood ashes, ground bone, or well-rotted manure.

12. Are any wires interfering with your tree, either by swaaying or by electric current? Are there any gas leaks?

Here are twelve points of a good street tree. The total percentage, if below par, reflects on the man, not on the tree. The tree always does its best. Man forgets that he has taken it out of the God-made forest, where it could and did care for itself, and has placed it in a man-made city, where it is dependent on man's care for thrifty growth."

SUMMER PRUNING FOR APPLES

Summer pruning as contrasted with the regular practice is the pruning of trees while in foliage. Its influence upon the tree in many respects is opposite to winter pruning. The latter stimulates wood growth, while the former tends to lessen wood growth.

As a rule, any practice that checks wood growth tends to induce fruitfulness. Growers have taken advantage of this fact for many years. In England the result is obtained by root pruning.

The method consists in digging a trench around the tree at some considerable distance and severing some of the roots. This interferes with the food supply and necessarily reduces growth.

Widely Practiced in Different Sections

In the famous Ozark apple region of Missouri and Arkansas the same result is attained by ringing or girdling the trunk or main branches of the tree, thus checking the downward flow of sap. The roots in this way are partially starved, and are therefore unable to induce a strong wood growth the following season. The work is done during the growing season, and as a result the wound soon heals over.

The growers in the Pacific coast region practice summer pruning to check wood growth. A complete or partial defoliation by insects, disease, or spraying injury during the early summer seems to have the same effect.

Just why the checking of the wood growth should induce the formation of fruit buds, and how it exerts this influence, is not well understood The theory has been advanced that there is some inherent tendency on the part of the tree to reproduce itself before it dies, and that when anything interferes with the natural processes the tree prepares for death. This is not a satisfactory explanation, and it is hoped that the physiologists may be able to throw some light on the subject in the near future.

Handling Young Trees

I believe that with young trees we should do very little winter pruning, and that we should direct the growth largely by summer pruning. The work to be most effective should be done a little each year, and at just about the time the tree completes its annual growth, which in this section is about the first week in July.

If done too early it will defeat its aim and produce a strong growth of shoots. If done too late it forces out a soft growth which is likely to be winter killed. The object of the work at first should be to direct the growth and later to induce fruitfulness. Only strong growing trees should be pruned during the growing season, remembering that it is a devitalizing operation and may easily be overdone.

With regard to bearing apple trees the necessity for summer pruning is less pronounced if not entirely eliminated. Since our mature trees tend to overbear, there is no necessity for inducing fruitfulness, and winter pruning would therefore be the most logical practice.—C. D. Jarvis, Connecticut Agricultural College.

THE HOME GARDEN

Peas in Potato Field

For the past two seasons I have been interested in the method my brother in Vermont used to grow his market garden crop of green peas. He plows his sod ground in the fall for potatoes, harrow in cow and horse manure. The next spring, just before planting time, he marks the ground 3 feet apart each way, dropping one piece of potato with two eyes to each hill or cross mark. He then has a man follow with peas, which have been soaked for a day in soft water, dropping not more than two peas at each two hills apart, fertilizer having been dropped before the potato. The hills are now covered by drawing the loose dirt over seed with the hoe and giving each hill a tamp with the hoe to pack dirt onto seed.

The peas and potatoes come up together, a little in peas' favor. He goes through twice with the cultivator and once with the horse how or shovel plow. If the peas are not of extra late variety, and season not too dry, they come up enough ahead of the potatoes so the cultivator and shovel plow do not cover them while going through. For spraying the potato vines he uses a commercially prepared liquid of the bordeaux type, which does not hurt the pea vines in the least.

He goes through the rows twice a week gathering peas for market, making a good revenue from peas to the acre. The pea vines do not choke the potato vines, and I believe help them, because in the hills where pea vines grew the loam seemed to be much lighter and porous. At potato digging time in September I measured the marketable potatoes; they averaged a bushel to 18 hills, or 268 bushels to the acre, which, considering the season, showed up much above the average.

The ground was rather light, receiving only a light manuring in spring, fertilizers put on at the rate of 600 pounds to the acre. I believe the peas did a double service, giving a money crop and at the same time helping along the potatoes. The tubers were the smoothest I have seen harvested. It seems this method should prove profitable to those raising potatoes by the drill or furrow method.—Walter Johnson.

GARDENING FOR BEAUTY'S SAKE

Every one knows the healing qualities of the soil. The sting of the bee and many other insects will be drawn out in less time by a mud plaster than by any of our latest known antiseptics. All the animals instinctively turn to the soil to cure their ills. Dogs bury themselves in it to heal skin trouble and rid themselves of vermin by soil baths. Handling soil is good for any one, and women are taking more and more to the occupations that mean a living fro mthe soil. Cultivating flowers and small fruits are foremost among the things women are undertaking. Several colleges to teach women floriculture have come into existence in the last six years because of this.

Flowers and children are always associated, and the cultivation of either should be a woman's forte. Beside the health-giving properties of handling the soil is the interest created in planting the seed and watching its unfoldment. It is quieting also to the nerves to attend plants—they are always responding to your care and giving such a return on the labor and time expended that the pleasure is only known by those who love them an dwork for them. Any woman who is run down, grown morose, and has lost her grip will find a new world open for her by cultivating plants. The daily revelation that is changing from start to ending of each season will keep her from mental depression, and the life with the beautiful will reflect itself from her countenance. It is a beauty tonic—this cultivation of flowers.

And now, with the air so full of the promise of new life, with the summer so near, there is an added incentive to get out into the garden and bring out the soul of the earth into flowers and plants. It will pay you a hundred fold in beauty and health.

A DELIGHTFUL SALAD PLANT

Any one unacquainted with cress has a pleasant surprise due him, if he will try it out in the garden next season, or plant some in pots in the house for winter use. The leaves are pleasantly pungent and may be used freely as a condiment, served with salads, or for garnishing.

There are several varieties of cress—the ordinary garden variety and the water cress. The seed is proverbial for its quick-sprouting habit. If cress is wanted in its prime continuously, seed must be sown every few days, or at least once a week, and sown thickly. It may be grown in large flower pots or boxes, in any light and reasonably warm place. The soil should be kept moist. Water cress is often grown in shallow waters, but the ordinary garden variety, more suitable for pot growing, simply requires generous moisture.

IRON AND APPLE COLOR

A writer in one of our American exchanges says:

"A Canadian paper is authority for the statement that the use of iron dust about the roots results in a greatly heightened color, as well as in longer keeping qualities, of the apples. If the use of our waste iron will improve the coloring of our apples, thus adding greatly to the attractiveness of their appearance, and also add considerably to the length of the time during which they can be used, let it, by all means, be used for this purpose."

Following is the reply of H. P. Gould, Pomologist in charge of Fruit Production Investigations, Washington:

Concerning the results of applying to apple trees liberal quantities of volcanic dust, containing a large percentage of iron, it is my impression that the high color of the fruit which the Canadian fruit grower attributes to this treatment occurred in spite of it rather than because of it. I do not see how the treatment mentioned could possibly have any direct influence on the color of the fruit. It is quite true that soils which contain a large amount of iron oxide are generally good fruit soils, other things being equal, but I do not think that they are favorable fruit soils because of the iron. The iron is present in the form of oxide, because the soil is well drained and well aerated. Such soils are usually good for fruits. The presence of the iron oxide is merely an indication of the character of the soil.

This proposition is about on a par with the notion frequently put forth in the past that driving a large number of rusty nails into a fruit tree increases its fruiting capacity and the quality of the fruit, because of the presence of the iron in the tree. The facts are that the results of this treatment, in most cases at least, are due to the checking of the growth of the tree by the injuries received rather than because of the presence of iron in the tree. It is my opinion that for most soils iron would have no particular effect upon the growth of the tree or its fruiting capacity.

THE COST OF GROWING APPLES

Under good orchard management where there are 200 or more trees in the orchard, it costs Maine growers approximately $1 per barrel to produce apples when the production is two barrels per tree; $1.25 per barrel when the production is one and a half barrels per tree; $1.50 per barrel when the production is one barrel per tree; and $2 per barrel when the production

is only one-half barrel per tree.

A tabulated statement of costs in nine orchards made by the Maine station in co-operation with fruit growers shows that the cost of production varies closely with the production per tree. Of course, considerable depends on age and condition of the trees, as well as the distance from shipping station.

The crop in 114 from 4409 trees was 7692 barrels, an average of one and three-quarter barrels per tree. The average total cost per barrel was $1.11, and the total cost per tree $1.94. This included pruning, fertilizing, hauling barrels, interest, taxes, etc. Among the leading items of cost per tree were pruning, 5 cents; fertilizing, 13 cents; spraying, 10 cents; picking, 15 cents per barrel; packing, 13 cents per barrel.

It cost $1.2 per barrel to produce apples in a 10-acre Baldwin orchard in New York under the supervision of the experiment station over a ten-year average. There were 27 trees to the acre, and the orchard was valued at $500 per acre.

The following is a summary of the cost sheet for a barrel of apples: Interest on investment, 21 cents; taxes, 1.2; tilling, 6.3; pruning, 3; spraying, 9.6; cover crop, 2.3; superintending orchard, 25; picking, packing, sorting and hauling, 24.4; giving a total of 93 cents a barrel.

The average price of barrels for 10 years has been 36 cents each; the price fluctuating from 30 to 40 cents. Adding the cost of the barrel to the cost of production, we have $1.29 as the total cost of a barrel of apples at the shipping point.

The average yearly production has been 116.8 barrels per acre worth $2.60 per barrel for the 79.2 barrels of barrel stock and 72 cents a barrel for the 37.6 barrels of cider and evaporator stock. This leaves a net profit of $95.60 per acre, which, added to the $25 interest on investment, gives $120.60, or over 24 per cent on $500 per acre as the annual dividend for 10 years, in addition to paying for labor and $300 for supervision.

PROTECTING TREES FROM BORERS

Apple trees may be protected from the flat-headed borer by painting the trunks with a heavy application of paint that will remain unbroken for two or three months and keep the female from laying her eggs. Pure white lead and raw linseed oil, mixed rather thick, will not injure the trees, and when applied to young, smooth bark will form a protective coat during the egg-laying season.

Before painting, however, the earth should be removed from the base of the tree for a depth of from three to four inches. The surface of the trunk thus exposed should be first scraped and painted and the earth then replaced. This is necessary, for the beetle occasionally lays her eggs under instead of above the ground.

CUCUMBERS IN THE CORN FIELD

In experimenting on a filler crop, I tried the cucumber vine with flint field corn. I planted cucumber seed every two or three hills at the time of planting corn; another section I planted the seed each two or three hills at the second time of going through with the cultivator, making a shallow hole with a pointed stick near the hill of corn and tamping the foot on same. I cultivated corn until it commenced to tassel, and was not bothered with the cucumber vines pulling up. At corn cutting time I found the cucumber vines 12 to 14 inches long and bearing one to two very fine cucumbers.

From seed planted at time of planting corn I harvested a splendid crop of yellow ripe cucumbers for making sweet pickle. From the other planting I harvested a crop of clean, crisp, green cucumbers, which for size would take a prize at the fair, and demand a good price in market at that time of year.—William Johnson.

APHIDES SPREAD THE BLIGHT

Investigations carried on by Prof. J. H. Merrill, assistant entomologist of the Kansas experiment station, show that the spread of twig blight in apples is largely due to presence of aphis. At least, he found that in orchards which were sprayed with Black Leaf 40 to control the aphis there was little or no twig blight.

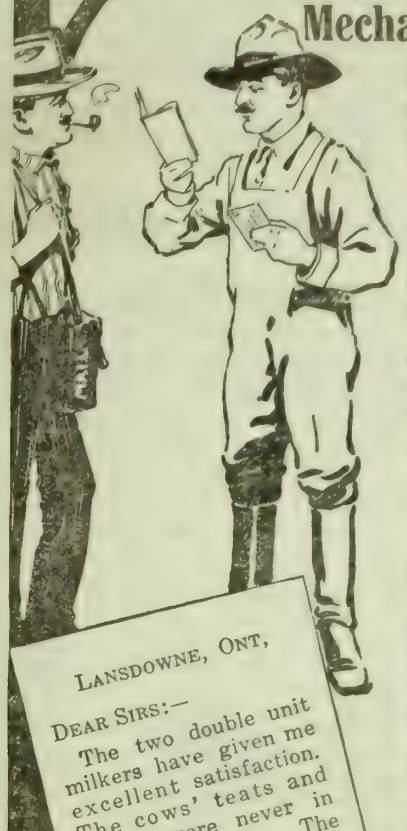
The twig blight was particularly bad in many Kansas orchards in 1913, and again in 1915. Jonathan apples were especially subject to it. A few growers sprayed their orchards in 1913 with a nicotine spray to kill the aphis, but they had practically no blight. There was little blight the following year.

Last year the conditions were particularly favorable for the aphis, and they were present in large numbers. Many more fruit growers sprayed than in 1913, and in their orchards there was little evidence of twig blight.

It is assumed from these facts that the aphides carry the germs of blight and commonly infect the twig either through the new leaves or growth, or through the blossom. The nicotine spray is very effective in killing them, and should be used promptly when their presence is discovered.

FARMERS

Have you had the Empire Mechanical Milker Booklet?



It is free, it is interesting—it is full of facts that every wideawake farmer and dairyman should know. Write for it to-day.

Empire Mechanical Milkers have solved the problem of milking. They free you from dependence upon hired help, and make it possible to keep more cows.

With one double or two cow unit, one man or a boy will milk 20 to 30 cows in an hour, and one man can operate two double units. See what a saving this would mean to you in wages if hired help does your milking; or in labor, bother and time if you do it yourself?

Read about it in the Booklet.
Read the letters from satisfied users

LANSDOWNE, ONT,

DEAR SIRS:—
The two double unit milkers have given me excellent satisfaction. The cows' teats and udders were never in nicer condition. The Empire Milker is a boon to any farmer, as one man can milk my 22 cows in 35 minutes.

L. B. WEBSTER.

JASPER, ONT.

GENTLEMEN:—
I purchased one of your milker outfits last spring. I would have had to dispose of my cows had I not bought it, as I had no help to milk. The machine is doing all you claimed for it and I believe it is the best on the market.

WILLIAM KING.

EMPIRE MECHANICAL MILKER

takes the Drudgery out of Dairying—cuts the wages bills—protects the milk from stable air, dirt and germs and usually induces cows to let down more milk.

You, or your Boy, or one hired man, and an "Empire Milker" could take care of a pretty large herd and do it easily. The Empire successfully imitates the action of a sucking calf and is easier on the cows than hand milking—it does its work thoroughly and well — milks evenly, smoothly and naturally — it is good for the cows—saves you money—increases your profits and makes you independent.

If you haven't had the Empire Milker Booklet, fill in the coupon and we'll send it to you. Do it at once.

Please send me The Empire Mechanical Milker Booklet.
I have..... cows.

PROTECTION FROM CUTWORMS

Protect as many plants as you can by wrapping the stems with strips of tough manilla paper about three inches square. This will protect tomato, cabbage and other plants. To 30 pounds of bran add one pound of paris green, two quarts cheap molasses, and water to make a mash. Lay this down at night, putting a teaspoonful or less in a place. Strew it thinly along rows of lettuce and similar plants. Mix only enough to use at one time, and put it out twice a week as long as the attacks continue. It will kill chickens or fowls if they get it, but in a few days it dries up, and they will not molest it.

This is most effective if put down early in spring before there are any plants for the cutworms to attack.

The important point in picking strawberries, and other berries, too, for that matter, is to get all the ripe fruit that is ready for market every day, as overlooked berries are usually over-ripe by the following day.

DAIRYING.

CONSTANT CULLING AND DISCARDING IN GRADING UP THE HERD

Each Individual of Every Generation Must be Carefully Sized up to Effect Higher Standard

A herd of full-blooded registered dairy cows is always a desirable possession, but very few farmers are financially able to own the same. They must be content with common stock, yet this need not mean that they shall work with cows that hold a low position as result givers. By careful selection of the cows and sire to which they are bred, it is possible to build any dairy herd up to a point where it equals in the results obtained, if not in blood, any registered herd.

The work of building up a herd from common stock requires much careful study and observation. The owner must be able to select a good cow by her general appearance. Some of the things that he can judge by are a large and capacious barrel, open and rather wide spaced ribs that spring well downward. A rather long head, a long and slim neck, and limbs that incline to fine. A nice, soft hide and silky coat may usually be considered as indications of quality in a cow. Good stamina is usually indicated by a generous width through the lower part of the chest, a bright full eye, and an active carriage.

The selection of a sire for use in the building up of a herd is of the utmost importance, and must not be done without careful consideration of the subject from the various standpoints. Select the breed that would seem best to meet the requirements as to milk or butter, as your market may demand. When a breed has been chosen and a sire selected, the program should not be changed, for that would annul, in a great measure, the work that had already been accomplished.

The individuality of the sire should be considered with care. Not only should he be as nearly perfect a specimen of his breed as possible, but he should possess all of the indications of stamina and bodily vigor. His ancestry should be looked into, too. The sires should have been result getters and the more ancestral dams he has that have records of large quantities of rich milk and persistence in milk-giving the more desirable he will be.

If the system planned out is carefully adhered to, the development of the herd should prove rapid. Each successive generation will show improvement, although this will be much less marked in after years when the herd has reached a point much nearer to perfection. A continuous sizing-up of each individual of every generation if a high quality of standard is to be reached and maintained. There must be a great deal of culling and discarding. Frequently the eye will be able to decide that a calf is incapable of being made into a good member of the herd and can be discarded without any further consideration. Other individuals require further observation, but as soon as their unfitness is recognized they should also be discarded.

In making an effort to improve the dairy herd the dairyman should set a standard of attainment—the highest possible. If this be done more and more pleasure will be derived from the work as it proceeds. In the end the satisfaction of mind with the results obtained will be worth as much as the increase in financial results.—Sherley Connell.

MATHEMATICAL SELECTION OF SWISS CATTLE

For some time the Swiss Department of Agriculture has been attempting to appraise its breed of cattle through federal examination by means of a rational mathematical system, and because of the excellent results obtained this method has recently been made official. Several French districts have even adopted this procedure to the exclusion of all others used for expert selection. This new method has for its purpose the determining and expressing in decimals of the correlations which exist between the conformation of the different parts of the body of the animal and its fitness. The instrument most practical for this is the measuring cane invented by A. Deriaz, of Lausanne. This is composed of a simple rod, grooved and graduated, provided with two perpendicular arms. One of them is fixed permanently at one end, and the other can glide along the rod and be stopped at any desired point.

The measurements which they take on the animal with this instrument are as follows: First, measurements of the length of the body, chest, loins and quarters. Second, measurements of the height of the withers (from the ground to the highest point on the animal), of the knee (from the ground to the lower edge of the joint), of the loin and of the tail-head. Third, measurements of the width, by means of the two arms of the instrument shown, of the hooks, pin bones and thighs. Fourth, measurements of the head, principally its length, its width between the base of the horns, and the width of face. By virtue of these given, and proportioning them to the fundamental measurement—the length of the body—one can understand in a logical fashion the value of this study of the bovine race.—Breeders' Gazette.

THE BIOGRAPHY OF "BOSSY"

As one of the earnest workers of the farm, I feel I am not understood. These people around the place scarcely appreciate the responsibility they assume. They are lax in their duty. Perhaps we animals are less dumb than humans might suppose.

Take today, for example. It has been filled with innumerable errors of judgment. Why do not people learn to know that little things make up the true greatness of this busy old world? I did not sleep well last night. Bud had left one of his measures in the stall, and several large stones must have gotten mixed with the bedding. As a consequence, I awoke bruised and sore and restless beyond the telling.

Oh, you didn't think a little thing like that would make any difference, eh! Well, it does. Bud came in at five o'clock, and a little later, when he saw the rough place on my coat where the measure had lacerated the skin, he swore—the way Bud knows how to swear—and figured that I had been kicking the bars and "thrashing around a bit."

A Little Hole in the Floor

While I'm on the subject, I want to mention that miserable little hole in the floor of my stall, where the wood has rotted away. It isn't that I envy the Jones farm cows in their immaculate concrete home, with everything as white and as tidy and as clean as a human's bathroom. Oh, no, it isn't that.

I can do very well in a wooden stall, especially as Mr. Bob hasn't been doing very well of late on the farm, but several times a day I get my foot caught

The Importance of FRESH oil

Oil is composed of very small balls, or globules, which roll between the parts oiled—that is the action of lubrication. As soon as these balls become broken, as they quickly do, they are useless—worse than useless for they keep away fresh oil. That is why the old-time splash system of oiling fails—it uses and reuses "worn-out" oil. Following the lead of big automobile makers, we use in the "Superior" Separator

"Direct-to-Bearings" Oiling System

Fresh oil is dropping on the important bearings all the time, and yet less oil is actually used in a year than with the "Splash" or "Bath in oil" system.

Write to-day for book of "SUPERIOR" Separator facts, showing why our machine is not only the easiest to turn, but skims the closest of all.

in that ugly hole. Rats come up through it and fuss around during the night, and they have knawed at it until it is larger than Bud realizes.

Late yesterday evening, after milking time, I made a misstep, and my hoof ran down into the treacherous place. I kicked with fright and attempted to pull my foot out again. When I did manage to liberate it I was lame. Poor Bud examined that leg and shook his head, and said "something had bit me." Holes in stall floors are so easy to patch up!

I want to mention something here before I forget about it. I know you'll laugh at me and say I'm a sentimental old fool, but I must speak out. Why can't Mr. Bob hire a man about the place who really likes and loves animals? When I was being led down the hill from our barn to the pasture lot I was a little slow, I fancy.

Not far from the sheds is a bad gully hidden by high oats, and accidents have taught me a lesson. I go slow when I reach that part of the lot. It's so easy to break a leg, you know. Kitty did in this same gully less than two years ago. Well, Bud was frightfully impatient. The moment he felt me lagging he gave the rope a sharp yank. I wasn't expecting it, and it hurt. My neck is a bit sore from too many of Bud's yanks.

Friday noon I had an evidence of Mr. Bob's goodness of heart. In some way —I can't tell you how—I managed to tangle myself all up in my pasture rope. One loop had caught in my horns, and another was wrapped about around my front legs. I was most uncomfortable.

Mr. Bob was seeing about a new artesian well at the foot of the hill. He happened to look up and across to the lot. In a moment he saw my predicament and came running over.

"What's the matter, old girl," said he, putting his arm about my neck and patting my perspiring flang. "In bad, eh? Well, we'll just fix this up in a jiffy."

With that he untangled the rope, and saw to it that it could not happen again, no matter how or where I roamed.

Good Hired Help a Problem

I suppose it's very difficult to secure the right kind of helpers—men with sympathy and understanding and the ability to think further than the surface duties of the farm. But Mr. Bob is an ideal chap for a dairy. He'll own a great place some of these fine days, and have hundreds of pedigreed animals.

One noon, as an example of his thoughtfulness, he saw that I was miserable as I panted in the field near the stone wall where Bud had tied me. Not a bit of shade, and it was sweltering hot. Bud had not given me a thought. It was one of the days when they would not permit me to roam around free in the big lot, and I had eaten every snip and blade of grass in the circle allotted by my pesky rope.

One when Bud passed I called to him. I never wanted to speak his language so badly in my whole life. I wanted to say:

"Please, Mr. Bud, won't you take me down to Mill Creek and let me have a drink. It won't hurt me just now if you are careful and watch. I'm so sick from the sun beating down on my head that I feel as if I couldn't live through it. Look, Mr. Bud, can't you see how pathetically miserable I am? It is agony. Not a bit of shade or shelter, and I'm tied and can't go in search of any.'-

Bud was thinking of something else. I followed him with my tired eyes as he mopped his perspiring brow and went staggering up the hill to the dairy house. In a little while he reappeared, standing at the door under that sprawled-out chinaberry tree, and he drank two small pails of cold milk without so much as taking a breath.

(Continued on pag. 616)

What a DE LAVAL Cream Separator SAVES Over any other Separator or Creaming System

QUANTITY of cream that no other separator will recover completely, particularly under the harder conditions of every day use.

QUALITY of cream as evidenced by De Laval butter always scoring highest in every important contest.

LABOR in every way over any gravity system, and also over any other separator, by turning easier, being simpler, easier to clean and requiring no adjustment.

TIME by hours over any gravity system, and as well over any other separator by reason of greater capacity and the same reasons that save labor.

COST since while a De Laval Cream Separator may cost a little more than a poor one to begin with it will last from ten to twenty years, while other separators wear out and need to be replaced in from one to five years.

PROFIT in more and better cream, with less labor and effort, every time milk it put through the machine, twice a day, or 730 times a year for every year the separator lasts.

SATISFACTION, which is no small consideration, and can only come from knowing you have the best separator, with which you are sure you are at all times accomplishing the best possible results.

EASILY PROVEN—these are all facts capable of easy demonstration and proof to any user or intending buyer of a cream separator. Every De Laval agent is glad of a chance to prove them by a De Laval machine itself—without the slightest obligation to the prospective buyer unless entirely satisfied.

If you don't know the nearest De Laval agent simply address the nearest main office as below

SHEEP PROFITS $5.00 PER EWE

Editor Maritime Farmer:

I was much interested in the letter of your Cape Breton correspondent describing his success with sheep in last issue of The Farmer. Cape Breton certainly must be a great place for growing wool, when his ewes averaged 8 lbs. per fleece. I trust he has not made a mistake in the weighing, for I consider an average of 8 lbs. for ewes bearing lambs remarkable. My own sheep are considered good, but they do not come up to that average, though the shearer said that my ewes were the best she has ever sheared. I weighed several of the fleece shorn only last Tuesday, 6th, and the best of the fleeces only weighed as much as eight pounds, while the average was considerably less.

The increase in the flock—50 lambs from 50 ewes—was also extraordinarily good. It is no use counting dead lambs; it's the number saved that counts. In my own flock this year I have one lamb for each ewe in the flock, and this I consider is as good as I have ever done—100 per cent strong, healthy lambs from a flock is good enough for me. I am not partial to twin lambs. I prefer my ewes to have only one lamb.

Your correspondent made good sales. As he butchered all his lambs, he must be an expert, because young lambs put on the market must be well butchered, and he has charged nothing for the butchering, though he credits the pelts at 65c each, which tends to swell the receipts.

I consider his feed bill unnecessarily expensive. I feed scarcely any hay to my ewes, simply early cut oat straw, turnips, and a little oats daily. I continue the oat feeding up to and a little past lambing time, which is in the first half of May.

If his figures are correct, your correspondent has done remarkably well with his flock. I think, however, that my own profit PER EWE will be, or usually is, much greater, probably because of my less expensive feed bill. Calculating roughly, I think my profits per ewe is about $5.

NANCY McDONALD, P. E. I.

Editor's Note:—The section of country from which our Cape Breton correspondent wrote is within easy driving distance of the best markets in Canada—the Sydneys and adjoining mining towns, with a population of over 75,000 people, many of whom are engaged in the steel and coal industries. Farmers in these districts frequently butcher their lambs, sheep, cattle, and pigs and market the meats themselves at the highest retail rate to hotels, boarding houses, restaurants, and private residences in the above-mentioned towns. A true case of direct from producer to consumer.

EXPERIMENTS IN CALF RAISING

Results of calf-feeding experiments conducted by the West of Scotland Agricultural College Farm, Kilmarnock, in 1914 and 1915 are published as a bulletin. The object of the test was to find out a cheap form of calf rearing in order to tide the calf over that critical period when it consumes milk foods or their substitutes. Some sixteen Ayrshire calves were chosen, and new milk was given to all for the first four weeks, this being given at blood heat. The first experimental ration consisted of whole milk, the second of separated milk and crushed oats, the third of separated milk and maize meal, and the fourth of whey and special calf meal. The average live weight of the calves at the end of the first four weeks was approximately 110 lbs. Hay was added to all the rations when the calves were six weeks old, and two weeks later a little linseed cake was introduced.

Whole-Milk Feeding

About 1¾ gallons per calf daily over the sixteen weeks were given. Hay at the rate of about 2 lbs. per calf was consumed, and of linseed cake about 1 lb. per calf daily. In 1914 the average weekly increase per calf was 14.85 lbs., and in the subsequent year 12.6 lbs. Valuing whole milk at 7d. per gallon, linseed cake at £10 per ton, and hay at 60s. per ton, the average cost per lb. live weight increase was 5.4d. in 1914 and 7½d. in 1915.

Lot 2, fed on separated milk and crushed oats, as well as hay and linseed cake, gave as the result of the sixteen weeks' feeding in 1914 the average weekly increase of 12.7 lbs., and in 1915 12.1 lbs., at a cost per lb. live weight increase in the former year of 3.5d., and in the latter of 3.67d.

Lot 3, on separated milk and maize meal, at the rate of about two gallons of separated milk and ½ lb. of maize meal per calf daily, with hay and linseed cake, made the average weekly increase per calf of 12 lbs. in 1914, and 12.1 lb. in 1915, at a cost of 4.26d. per lb. live weight and 4.06d. respectively.

Whey

Lot 4 were fed on whey and special calf meal, but as it was thought that the whey had a scouring tendency, and was not very suitable for the purpose, the experiments in 1915 were slightly changed in the transition period from whole milk to the new rations, and the result was certainly better, but not very much so. Twelve weeks' feeding in 1914 produced an average weekly increase per calf of 9.5 lbs., and eleven weeks' feeding in 1915 gave the average weekly increase of 9.7 lbs. The cost per lb. live weight increase was 4d. and 4.3d. respectively.

Conclusions

Professor Patterson and Mr. Lindsay Robb say: That the cost of rearing calves on whole milk is prohibitive in the case of ordinary commercial animals. That separated milk and crushed oats, or separted milk and maize meal, make suitable and economical rations for calves, provided (a) that the calves are fed solely on whole milk till they are four weeks old, (b) that the change of ration is gradually effected, and at least two weeks taken to complete it; (c) that hay and linseed cake are introduced into the ration after six and eight weekly respectively. That the live weight increases from the maize meal and the crushed oats rations are practically identical when ¾ lb. crushed oats are fed as against ½ lb. maize meal. That calves retain their bloom rather better on crushed oats than on maize meal, but that both rations produce very fine calves. That the whey ration fed cannot be recommended as a suitable one until calves are at least eight weeks old—(a)b because of its tendency to scour the calves, (b) because of the somewhat ragged and baggy appearance which attends its use, and (c) because calves fed on this ration are apt to get down in condition.

Barrett
Made in Canada

Money Savers for Farmers

Practical Parables

A FARMER went forth to inspect his farm. It was near the end of his fiscal year and albeit he thought he had left nothing undone he found that things were not as should be. His stock was lean, nervous and not yielding great profits. His fences were straggling and ready to fall, having rotted in the posts. His harrow and certain expensive implements were rusted for he had not painted them. His barn admitted water at the roof, and likewise his own home, and that of his poultry. And the little gutters that should carry the water from roof to ground did leak too and were in sore need of repair. And even more so, the roofs on his many buildings which had cost much gold and labor, were not attractive nor yet durable. So the farmer was exceeding down cast. And it came to pass that a more successful neighbor came unto him and said:

"A LARGE part of my profits are due to watching the little leaks. Barrett Money Savers helped me. Take Carbonol for instance. No farmer should be without it. It has all the merits of carbolic acid *without the danger*. Effective in a hundred different places. If you cut your hand, apply Carbonol in solution. If your live stock get bruised, Carbonol will fix them. It disinfects sick rooms, and makes house cleaning easier. Begin to economize today by buying Carbonol.

"A LEAKY roof means more than incoming water. It means outgoing money for repairs or damages. Begin right with Amatite, the ready roofing that needs no paint. Put Amatite on your steep roofs and sidings. Wind, rain and weather can't hurt Amatite. Its sparkling mineral surface improves the appearance of any building and guarantees durability. Made in rolls of 110 square feet, with galvanized nails and cement in the centre. Easily laid without skilled labor. I ended my roofing troubles with Amatite.

"THE greatest enemies to live stock and poultry are lice, mites, vermin and flies. I keep my live stock clean and happy by spraying them with Creonoid, and I spray my roosts regularly. It is the most economical and effective animal antiseptic I have ever seen, and I've tried them all. All you have to do is spray your stock once or twice and their pests will go away, leaving your hens, cows, pigs and horses healthy and happy. Be sure to follow directions carefully. There are many other valuable uses for Creonoid and you had better ask them to send you their booklet on the subject. Don't delay when the solution of your problem is so easy.

"I USED to help the Farm Machinery Company pay dividends until I was advised to try Everjet Elastic Paint. You see metal seldom wears out; it rusts out and Everjet positively prevents rust. It never peels, scales or cracks. There is more merit in Everjet than I can tell you of. Everjet is especially recommended for use on 'ready roofings' because of its low price and great covering capacity. Protect your roofs and machinery with Everjet.

Barrett's Grade One Liquid Creosote Oil

"YOUR wooden fences would have been good for twenty years if you had painted the buried parts of the posts with a good wood preservative. Why not do it now? Get some of Barrett's Grade One Creosote Oil. Tests have shown that it is the best wood preservative on the market because it penetrates deeper and lasts longer than any other. You can't beat creosote for insuring the life of the wood. Barrett's is the best creosote.

EVERLASTIC ROOFING

"IF YOU are not satisfied with your roofs, or want a covering that will keep wind and water out permanently, at low cost, you should try Everlastic Roofing. There is no better 'Rubber Roofing' on the market. It is inexpensive, easy to lay and gives excellent service for years. Just the thing for outbuildings. Made in one, two and three ply weights. The rolls are 36 inches wide. You need some Everlastic Roofing.

"THEN there is a product you ought to have just on general principles. As an aid in quick repairs, Barrett's Elastigum Waterproof Cement is a wonder. And it repairs permanently too. Just the thing to join and reline gutters, whether wood or metal. It seals leaks and joints and is unbeatable for flashings around chimneys."

Send for illustrated booklet describing Barrett Money Savers in detail. Address nearest office.

TAKE THE HORNS OFF CALVES WHEN YOUNG

There are two periods in the life of a bovine when the horns may be removed—when very young, and after reaching maturity. The method of procedure will vary greatly with the age of the animal. After a careful study of methods, results, etc., I think all will agree that, everything considered, the best time to operate is when the animal is young. At this time

very little skill is necessary, there is little constitutional disturbance and consequent loss in products and flesh, and to me more important still seems to be the fact that animals thus operated upon in the large majority of cases come out with no serious scar or deformity, and have a perfectly smooth poll closely resembling those animals born hornless.

When mature animals are dehorned it is very common to see stumps left varing in length from one-half to two inches, which are weapons almost as savage as the entire horn. In this operation considerable skill and experience are required to give uniformly good results. When performed by the inexperienced, great difficulty is encountered in properly restraining the animal, this often resulting in a hurried and incomplete operation.

Dehorning Calves

As a result of many experiments covering a wide range of time and country, it has been decided that the best dehorning agent is caustic potash fused in the pencil or stick form. Directions for dehorning calves usually state that the caustic should be applied as soon as the budding horn or button can be felt under the skin. As a rule, this can be done when the calf is but a few weeks old, and although it is claimed by some that horns may be removed from animals six months old, it is undoubtedly best to operate early.

When the proper time arrives, clip the hair over the horn from an area the size of a half dollar, wash with soap suds, and rub on the moistened caustic. To prevent the caustic from running, moisten it only slightly, and apply lard or vaselin all about the spot treated. When the scabs fall off, a careful examination should be made, and if the horn is still prominent make another application of the caustic. To protect the fingers, wrap the caustic well with paper. If active caustic is thoroughly applied over a sufficiently large area, the horn will unfailingly be killed by one application.

By all means, dehorn your calves, thus saving time and perhaps avoiding serious personal injury.—Dr. E. H. Lehnert.

"TRIMMING" SHOW SHEEP

Mr. C. Elgar, in a communication which we quote from the "Kentish Express," calls attention to one aspect of the show question which is worthy of note. No one can have failed to notice the extraordinary levelness of the sheep at our leading exhibitions, and the eveness of the fleece, but it is not every one who realizes that these desirable features are often, if not always, the result of trimming or "barbering." Like the coloring, which is a practice that dies hard, if indeed it can be said to have begun the process of decay, it has the effect of disguising the sheep, making it unlike what it really is in a state of nature, and so far is deceiving. It is obviously difficult to draw a line and to say that the preparation of an animal for show shall go so far and no farther, nor would it be easy to judge when the line, if fixed, had been exceeded. But Mr. Elgar points out that the result is the concealing of defects, which nevertheless are reproduced in the offspring, to the disappointment of the purchaser and to the detriment of the breed, if only so far as the export trade is concerned. No amount of barbering or trimming will make the ram other than it is, and so far as it is possible treatment which aims at deceiving should be discouraged. The task in front of the societies if they desire seriously to tackle the problem is not a simple one, but much might be done if they looked at it from the standpoint of the good of the breed rather than from that of the interest of the exhibitor. It may be contended that the expert judge may safely be trusted to detect faults, however skilful the show preparation, but in view of the arduous nature of the work of adjudication when the classes are large, it would be a great concession to admit this. And even then, as Mr. Elgar shows in the following paragraph, the purchasers may still be deceived:

Trimming the Fleece

"Now I come to what is a well-known world trouble where sheep compete in sale yards or show rings: that is, the trimming of the fleece, and the dates of shearing. There is little to be said about it, except that the effect is thoroughly bad where sheep are being judged for their value as wool producers. However keen an eye a judge or buyer may have, it is difficult sometimes to detect it, or to know how much it has been resorted to. Instead of breeding out defects, reliance is placed on the skilful use of shears. It is hardly worth pointing out that it is a bad policy, for the sheep will show all its defects the next year, and the buyer is disappointed in his purchase, and it may mean—and certainly has taken place amongst oversea buyers—that they have not come again. How to deal with this trouble should be one of the objects of the Sheep Breeders' Associations."

HOG PASTURES

Pigs make the cheapest gains on pasture. Trials at the North Dakota Experiment Station indicate that brood sows running on good pasture and nursing litters will do as well as when receiving one to one and a half pounds of grain per each 100 pounds live weight of sow, as sows in dry lot receiving two and a half pounds grain per day each 100 pounds light weight. The pasture just about cuts the feed cost in two. The pasture alone does not furnish enough feed for either the brood sow with litter or for the weaned pigs. They should be fed some grain, so as to make a rapid growth. In this way the spring pig can be ready for market before real cold weather sets in.

Alfalfa, clover, bromus, and winter rye make the earliest pastures. When these have not been provided, early spring seeding of such grains as oats and barley or rape are the next best thing.

Auto Tongue Truck on Deering and McCormick Binders
SELF-STEERING FEATURE

The binder is purposely thrown out of square in this illustration in order to show clearly the steering action of the tongue truck wheels.

When the outer end of a binder platform starts to hang back, it pulls the tongue truck toward the grain.

Any movement of this tongue truck toward the grain turns the truck wheels in the opposite direction and at so great an angle that they automatically steer the binder back to its proper square cutting position, with the horses moving steadily straight ahead.

The truck wheels turn faster than the tongue as shown by the dotted lines.

A Gain Worth Making

WITH the **new auto tongue truck, Deering** and **McCormick** 8-foot binders cut a full 8-foot swath. That means a quicker, easier harvest—a saving of time when time is worth money. The driver's work is easier, too; on the straight-away because the horses are not crowded into the standing grain; and at the corners because the binder turns a natural square corner.

The wheels of this **new auto tongue truck** are fitted with removable dust proof bushings equipped with hard oil cups. This construction does away with the expense of buying a new wheel every time a bearing wears out.

The **new auto tongue truck** is only one of the important improvements on these binders. For instance, compare the wide, strong, deep-lugged steel main wheels with those on other machines; and compare also the arrangement for keeping canvases running true, which make them last so much longer.

Decidedly these are the binders to buy. See the I H C local agent or write the nearest branch house for full information about their good features

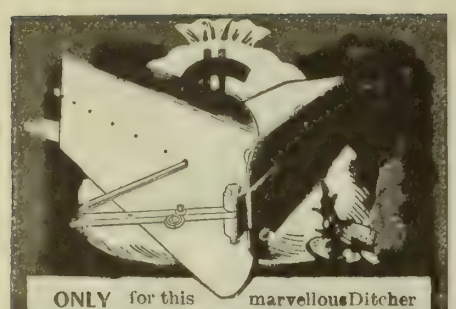
COULD NOT SLEEP
Nerves Were So Bad.

To the thousands of people who are tossing on sleepless beds night after night, and to whose eyes sleep will not come, Milburn's Heart and Nerve Pills offer the blessing of sound, refreshing slumber, because they restore the equilibrium of the deranged nerve centres, thus restoring strength and vitality to the whole system.

Mr. Arthur McCutcheon, Mt. Pisgah, N.B., writes: "I have been much troubled with my nerves, and could not sleep for hours after I would go to bed. I would toss and turn from one side to the other before I could go to sleep. I would then wake up in the night and lie awake a long time before I would get to sleep again. I thought I would try Milburn's Heart and Nerve Pills, as they were recommended so highly. I now go to sleep without any trouble; my nerves seem quieted, and when I lie down I go to sleep quickly. Anyone who is bothered with their nerves should keep a box on hand."

Milburn's Heart and Nerve Pills are 50 cents per box, 3 boxes for $1.25; at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.



ONLY $47.50 for this marvellous Ditcher and Grader. It will dig your ditches to a depth of 2 or 3 feet—grade your roads—clean out your old ditches—will do as much work in a day as 50 men with picks and shovels.

Send to-day for catalogue.

THE HORSE

THE HORSE INDUSTRY

The Canadian horse industry is now entering upon a new era in its history. However, before taking up the existing situation, it would appear advisable to go back a couple of decades and review conditions that obtained during the closing years of the last century, and up to the outbreak of the war.

The periods of so-called good and hard times seem to occur in cycles of years. The cause is the condition of the money market and its consequent effect upon all kinds of business. No industry is so quickly affected by a depression as that of the horse breeder, and in probably no country does this statement apply with greater force than in Canada. Being a young country, large sums of money are needed to develop the latent resources of our farms, forests, mines, and other industries. To this end it has been necessary to engage extensively in the building of railroad systems and other public works. However, when conditions changed in the money market and the banks refused to loan as previously, a reaction necessarily followed. Manufacturers curtailed operations, while all great works ceased except those really necessary. A study of the horse census of Canada gives a fair idea of these fluctuations in the money market, or cycles of good and hard times.

The Period from 1891 to 1901

During this decade the horse population of Canada increased, in round numbers, 100,000, as against over 400,000 for the previous ten years. Toward the close of the period light horses became a drug on the market, while the demand for draughters was limited, and the price very low. The result was that in many sections of the country breeders became careless. They ceased patronizing pure-bred sires, because of the service fee. In other sections they almost ceased breeding heavy horses for the time being. Others started raising light horses. As it was impossible to get rid of anything but the best, the practice of breeding mares that were old, unsound and of poor conformation became prevalent. This, coupled with the use of scrub sires in many parts of Canada, produced a retrograde movement. Fortunately for the country, however, many of the good districts continued to improve their horses, and when conditions changed supplied much of the breeding stock with which to start anew.

The outbreak of the South African War in 1899 had a beneficial effect upon horse breeding. While it lasted many thousands of horses were taken out of the country, and for the country's good. The exportation of the surplus, the brightening of conditions in the money market, and the rush of immigration had a far-reaching effect People began breeding horses again.

The Period from 1901 to 1913

Between 1901 and 1911 the horse population increased a little over 1,000,000, or almost ten times as many as during the previous ten years. During the next three years the increase amounted to over 250,000, a considerable falling off taking place during the years 1913 and 1914.

The Cause

From 1901 to 1912 the country developed beyond the most sanguine expectations of the people, and the price of horses rose to the highest point in the history of the country. The demand for horses made it possible for breeders to get rid of almost anything that might be given that name. Good animals, whether light or heavy, brought good prices. Comparatively speaking, the poorer animals brought higher prices than the better class, and often very much more than they were worth.

The Light Horse Period

From 1903 to 1908 the light horse came into his own. The good and the bad were in demand at fair prices, while the choice animals were eagerly sought after, and readily picked up at unheard-of figures. The amassing of wealth by many of our citizens, the desire to obtain publicity and to achieve fame in the show ring, and the scarcity of show-ring winners, together with the advent of the automobile, were factors that, in the end, proved the undoing of the light horse. During this period some of the best of our light sires were taken out of the breeding studs and gelded in order to make show-ring winners of them. Wealthy men, after having achieved the successes which they had set their hearts upon, and, having no further interest in the horse industry, quickly disposed of their large stables and dropped out. Others, unable to secure the class of horse they desired, turned to the automobile. It might further be explained that automobiles cost much less than it would to establish a first-class stable of horses and properly equip it, particularly for city use. The stringest laws and restrictions imposed by city health departments against the building of stables or the keeping of horses within certain areas, also had a detrimental effect. Thus the demand for, and the number of light horses—by which is meant particularly the carriage horse or high-stepper—also, but in a lesser degree, the saddler and hunter—has slowly but steadily lessened year by year, and it would appear that their day for city use has largely passed. Before they could again take their former place it would take years of breeding to get a sufficient number, and years to train and fit an entirely new set of grooms and coachmen. Nevertheless, a number of people will continue to use these horses, and there will always be a limited market for choice animals at fair prices. However, as experienced breeders well know, but a small percentage come up to the standard. The everyday farmer should leave this field to the expert.

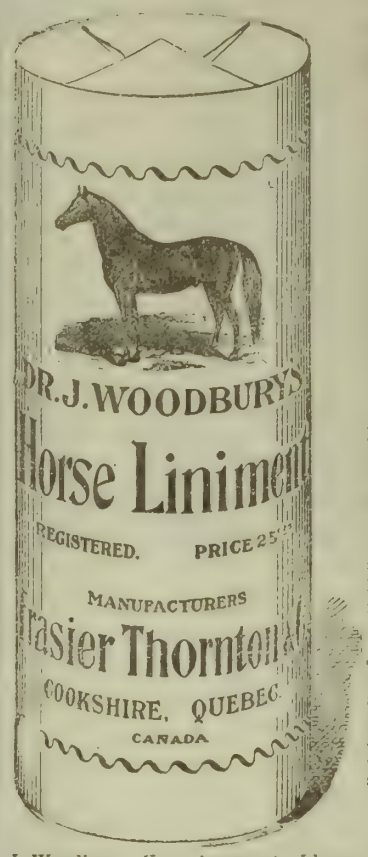
The Heavy Horse Period

The demand for heavy horses grew with the increase in population and the consequent development of the country. The high-water mark was reached in the years 1911 and 1912. Up to this time draught horses of any kind found a ready sale at good paying prices, while the good big ones were eagerly sought for and quickly picked up at figures heretofore undreamed of. In the opinion of many, the middle class and poorer draughters brought a price much beyond their intrinsic value, but this was largely through the supply not being nearly equal to the demand, and also to the fact that often the source of supply was far removed from the centres of demand.

During these years heavy horse breeding took a decidedly onward and upward trend. The free circulation of money made it possible for the people to buy and use a better class of sire than heretofore. Consequently the importers were not only enabled but compelled to bring a rather better class to the country. In certain sections the improvement that took place was truly wonderful. Unfortunately, however, this applies only to certain sections

Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N, S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.

Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

FRASIER THORNTON, &, CO., Limited, Manufacturers: Cookshire, Quebec, Canada.

Seized With Paralysis Could Not Walk

Most Extraordinary Cure Effected by the Use of Dr. Chase's Nerve Food.

To have the nervous system paralyzed, to be unable to walk and scarcely able to talk, and then to be completely cured, is not a usual experience, but Mr. Hyatt tells in this letter what he passed through. Doctors told him his case was hopeless, and when they gave up he turned to Dr. Chase's Nerve Food and obtained complete cure.

Mr. Avery Hyatt, blacksmith, St. Anns, Lincoln Co., Ont., writes:—"I am a blacksmith by trade, and ten years ago became afflicted with paralysis. I could not walk or read or write, and could talk with difficulty, so that it was a hard matter to understand anything I would say. Being only a young man, I was nearly discouraged. Two doctors told me it was brought on by overwork, and that my case was hopeless.

"One day my father read about Dr. Chase's Nerve Food, and advised me to try it. I bought 12 boxes, and when the fifth was used I saw that I was getting better. By the time the 12 boxes were used I was cured. I am well and strong and working every day, thanks to Dr. Chase's Nerve Food."

This statement is certified to by Mr. Elmon J. Hodgkins, J.P.

No ailment is more dreaded than paralysis. And yet how few people realize that paralysis of the nerves is only the natural result of neglected nervous troubles.

At first you do not sleep well, have nervous headaches or indigestion, find yourself easily irritated and annoyed, can hear noises which in good health you would never notice. You do not consider yourself sick, and yet you lack the usual energy and vigor and feel out of sorts.

Restore the nerves by using Dr. Chase's Nerve Food. 50c a box, 6 for $2.50. All dealers, or Edmanson, Bates & Co., Limited, Toronto.

THE BEST LINIMENT

OR PAIN KILLER FOR THE HUMAN BODY

Gombault's

Caustic Balsam

IT HAS NO EQUAL

For the Human Body —It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Exterior Cancers, Boils Corns and Bunions, CAUSTIC BALSAM has no equal as a Liniment.

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

of our country. It was not uncommon to find that, while one district improved the conformation, quality, and size of its horses very materially, others adjoining went on using inferior sires and poor mares, just as they had done in previous decades. Nevertheless, there is in Canada today a great deal of high-class foundation stock, both imported and home bred, which if properly handled will prove of inestimable value to the country.

Conditions in Canada

The outbreak of the war found the country with a very considerable surplus for which there was little demand. Since that date pratically the only demand had been for remounts. Up to the end of the Fiscal Year 1915-16 in the neighborhood of 50,000 horses had been purchased. Of this number the British War Office took close to 14,000 head, the Canadian Department of Militia approximately 26,000, while the contractors for the French Government took over 7,000 horses. The French contractors who are now buying in the country have still large contracts, and are willing to buy every suitable horse that Canada has to offer. One firm writes saying that their contracts call for 10,000 a month while war lasts.

The prices paid for war horses may seem to be low after the exceedingly high prices that prevailed for a number of years. It should be remembered, however, that the class of horse taken is one that, generally speaking, the country can well afford to do without, and, further, that, all things considered, the average price paid is an exceedingly good one for the average class of horse taken.

Allied Countries

At the outbreak of the war practically all suitable horses were commandeered by the British and French for army service. It is true that they saved their best stallions, but, generally speaking, they were forced to send forward large numbers of their good breeding mares. It will be necessary, therefore, at the close of the war for those countries to import horses until they can re-establish breeding operations.

The horse industry of Belgium has been practically wiped out. A few of their good breeding animals were driven into France, but the Germans seized all the good horses and sold them by auction in Germany. This means that when peace is restored the horse industry in that country will have to be completely re-organized.

Future Demand

The good crop of the past year has enabled the Canadian farmers to go out and buy a part of the horse power so badly needed, and accordingly a good number of horses have gone into needy districts, with more to follow. Carload lots are being shipped quite commonly. Already the number of horses from east to west far exceeds the total number shipped during 1915. The increase in immigration, which is expected to follow the war and must of necessity go to the land, will create a still further market.

What to Breed

The only safe advice that can be given to the farmer is to start now to breed good draught horses, sound, of good conformation, and as large as possible. These will undoubtedly be wanted in numbers both at home and abroad.

The only light horse that bids fair to be wanted is the good big roadster; a square trotter of good conformation and sound, weighing from 1050 pounds upwards. However, the demand for this class of horse will not in any way compare with the demand for draughters. Nevertheless, there should be a steady market for good animals such as has been described.

Commercial Breeding

During the past the attention of the

POULTRY

POULTRY

To any one who has not carefully followed the direction of the poultry development in Canada an understanding of the status which the poultry industry has now reached must constitute a distinct surprise. Whether viewed from the standpoint of the farmer or of the produce trade, it is now one of the best organized and most progressive of any of our live stock industries. Co-operation among farmers in marketing is improving the product and realizing for them a higher price than they have hitherto been able to obtain. The reorganization of methods by the trade is providing against loss in handling, is assuring to the consumer a better article, and establishing our export business upon a firm basis.

It is estimated that Canada and Cuba during the last twenty years received from the United States about three-fourths of all the eggs exported by that country during that period. This situation, however, has now changed. As against an importation in 1913 of 13,240,000 dozen, we imported in 1915 not more than 3,783,952 dozen. On the other hand, while in 1913 we exported only 147,149 dozen, in 1915 we exported 7,898,332 dozen. This constitutes a net increase in production, in two years, of at least 17,1000,000 dozen. Practically all of these exports went to the United Kingdom.

Notwithstanding the surplus in Canada which these figures indicate, prices during March, April, and May have remained at an extraordinarily high level. For the first quarter of the year 1916 the price to producers, selling co-operatively, has been at least 4c in advance of the price received for the same period in 1915. For the month of March it was at least 5c in advance, and for the month of April at least 3c in advance of last year's price for these respective months. The demand for eggs for local consumption, for storage purposes, and for immediate export, has rarely been so keen as at the present moment. This situation is clearly reflected in the prices just quoted. Heavy domestic consumption in the face of the high price for meats partly explains this condition. Confidence in the export demand, on the part of the produce trade, confirms it from another direction. Notwithstanding increased production, the egg and poultry business in Canada is in a very strong position at the present time.

Under these circumstances, we believe that it will be a very wise practice to raise as many chickens as it is possible or practicable to handle. Early hatched chicks make good winter layers. Rough grains will probably be produced in abundance in Canada this year, and the feeding of poultry at a profit should be materially assisted from this source. Eggs at winter prices are a paying proposition, in any event. Poultry, alive or dressed, under present and prospective market conditions, can unquestionably be reared and finished at a decided profit. A good flock of poultry, if carefully handled, will serve to prevent waste on the farm and promote economy in living expenses, such as is particularly necessary when all farm products are becoming so marketable and so dear.

RANGE OR CONFINEMENT

When fowls have free range they are healthier, lay a greater number of eggs, and return more profit than when confined to small yards. The Ohio station has made a comprehensive test in order to compare the egg production of hens kept in yards or allowed free access. The first experiment with 202 White Leghorns lasted from May 5, 1912, to October 3, 1914, a period of 882 days. The results are shown in the table under Lot 1. The value of free range was shown to be 62 cents per hen.

The second experiment started November 30, 1913, and closed November 27, 1915, a period of 728 days. There were 114 White Leghorns in this experiment, which was practically the same as the first. The egg production of the hens, especially that of the lot on range, was unusually high.

Twenty of the 53 hens in the range lot that were living at the close of the year, as well as one that died, produced 200 eggs or more in 365 days from the time they started laying. Fourteen of the 50 hens living at the close of the second year, and one that died, produced more than 350 eggs each in two years, their average being 291 eggs.

The value of the range per hen was $1.29 for the two years, which would figure out at an annual rental of more than $26 per acre. The returns from this experiment are also shown in the table under Lot 2. A third experiment was begun when the second one closed and the first year's returns are quite similar.

No special effort was made to secure a heavy egg production. The hens were fed twice a day on a grain mixture composed of three parts by weight of cracked corn and one part of wheat. They were given access to a mash mixture composed of four parts ground corn, two parts wheat bran, two parts meat scrap containing 50 per cent of protein, and one part of linseed oil-meal. The fowls also had access to oyster shells and grit.

Summary of Results

	Range		Confined

TO PREVENT MITES

One of the first things to do when the warm days come is to clean the

"I have a
Back-ache
and feel so weary"
Your Kidneys are overworked. They need the strength and tone that Dr. Cassell's Tablets can give
Restoratives—not Drugs
Backache is evidence that your kidneys are weak, that there is not sufficient vital force to keep them properly active. Drugs in such a case can only irritate. It is strength that is wanted, and that strength must come from the living battery of vitality we call the nervous system.
That is why Dr. Cassell's Tablets are so unfailingly effective in the cure of backache and other results of kidney weakness. They nourish the nerves and nerve centres, replenish the vital reserves, and so restore health to the kidneys by supplying that vital force upon which the activity of the kidneys and of every other bodily organ depends.
Dr. CHAS. FORSHAW, F.C.S., D.Sc., etc., a well-known English scientist says:—"I have tested Dr. Cassell's Tablets and can conscientiously recommend them as an eminently safe and effective remedy for nerve and bodily weakness, for anæmia, malnutrition, and many forms of stomach and kidney troubles."
Dr. Cassell's Tablets
Dr. Cassell's Tablets are Nutritive, Restorative, Alterative, and Anti-spasmodic, and are the recognised remedy for

on very favorable terms, in either bulk or bags and solicit inquiries.

POULTRY SUPPLIES.

Your Child May Have Worms

Keep a watchful eye on your child's health. Above all guard against worms. Familiar symptoms of worms in children are: Deranged stomach, furred tongue, belching, variable appetite, increased thirst, acid or heavy breath, nausea, enlarged abdomen, costiveness, pale face of leaden tint, bluish rings around eyes, itching of nostrils, languor, irritability disturbed sleep, grinding of teeth, irregularity of pulse.

Trade Mark

Grown folks are subject to worms also.

The one best remedy is Dr. True's Elixir, the Family Laxative and Worm Expeller. First sold in 1851—today it has a world-wide reputation. Good for adults also. Get a bottle today—at your dealer's; 35c. 50c and $1.00. Advice free. Special treatment for tapeworms. Send for book.

Knowlton, Que. Dr. True

poultry house thoroughly, especially if there has been trouble with mites the year before. Roosts and nests should be carried outside and treated to a thorough cleaning and a coat of whitewash will always improve the interior of the house, whether mites are present or not. If the floor is of earth, it is well to remove an inch or so of the surface that has become more or less saturated with the moisture from the droppings through the winter, and replace it with fresh, clean soil. The nests should be filled with fresh nesting material, and everything made as fresh and sanitary as possible. To finish the good work, it is well to get over the flock at night and treat them for lice. If a little grease is used in the feathers below the vent and a good louse powder over the rest of the body there will not be many lice left to play havoc among the early broods of chickens.

KEEPING THE PREMISES CLEAN

Probably no subject in poultry lore has been treated in the press so much as that of cleanliness. Its importance is so great that neither too much can be said of it nor can it be too rigidly enforced. The health of the flocks and the success of the farm depend largely upon the enforcement of the rule.

The houses must be kept clean. This does not refer to dust, as that cannot be avoided, inasmuch as the fowls must scratch among the litter and wallow in the dust bath to keep themselves clean. But there is no reason for allowing the cobwebs to accumulate, hanging down from the ceiling so that these tiny chains encircle one's face as he enters the pen. Neither is there any excuse for allowing the manure to accumulate on the dropping boards, or the floor of the pen allowed to become filthy.

A discarded house broom will be just the thing for keeping the place tidy. Sweep the ceilings and walls of these unsightly cobwebs, and gather up the accumulation of dirt on the floors.

REMEDIES FOR BOWEL TROUBLE

Slight bowel disorders of young chicks can often be remedied by the use for a few days of a teaspoonful of lime water in each quart of drinking water. The use of boiled whole milk in place of water as a drink for the chicks has also been found effective in light cases. Paregoric is a very effective remedy. It should be placed in the milk or water at the rate of two to four drops to a quart, allowing the chicks no other drink for a few days.

These remedies will not be effective unless the cause of the trouble is corrected. The chicks that are most affected should be killed and buried, the house thoroughly cleaned and sprayed frequently with a good coal-tar disinfectant. After a flock is removed from the brooder house it is a good plan to mop up the floors with a strong creolin solution and then heat the house so the whole interior will become steamed with the disinfectant.

These precautionary measures, coupled with frequent cleaning of the house and careful feeding, will often overcome the trouble without recourse to drugs.

CARE OF YOUNG STOCK

Crushed oyster shell is the best material for shell making.

Duck eggs should be marketed frequently, as they depreciate in quality more rapidly than hens' eggs, especially during hot weather.

A promising bunch of growing chicks can be spoiled by one night's sweating. Allowing 100 or more to crowd together in a small coop is sure to be the ruination of some of them. If you would raise the finest fowls, do not allow more than 50 youngsters together at night.

With the arrival of warm weather the army of mites is fast recruited. Get ahead of them by soaking the roosts, drop boards, and floor with crude petroleum. A little goes a long way in disinfecting the premises and destroying lice and mites.

The feeding of milk to young chicks has a most favorable influence on the growth and on lessening the mortality. It tends to prevent mortality from all causes, and if fed soon enough and for a sufficiently long period greatly reduces the death rate caused by bacillary white diarrhea.

When the young turkeys are large and strong enough to jump over the sides of the pen, I let them run with the hen, gathering them in when a rainstorm threatens. As they are very susceptible to dampness, it is best not to let them out in the morning until the dew is off the grass.

Scrub hens are just scrubs, and even under the best of management will show little profit. In the Connecticut laying contest a pen of 10 scrubs laid so few eggs that the food consumed between November 1 and March 1 made them cost 7 cents each. Any old thing will lay in March, April, and May, when eggs are cheap.

THE CACKLE OF A HEN

Listen for the cackle of your hen. It has a money value to you.

When the winter season approaches, when the price of eggs will advance and the cackle will become of even greater significance to you.

Plan for the cackle, feed the hens in accordance with the demands of nature as propounded by the experts who have spent their life in the work.

If the cackle is not heard with sufficient frequency, ask yourself why. Dig down and study the subject, for the more you study the oftener the hen will cackle, and cackling means more eggs and a bigger bank account.

It is the law of nature that a hen should lay, and cackle. She should lay often and do much cackling, for that too is nature's law.

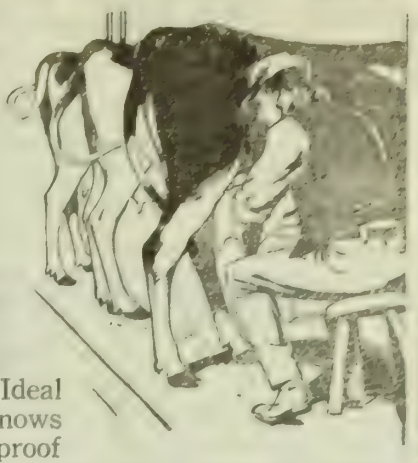
But she will not lay unless she receives proper food and care, and therein lies the wisdom of the man who thinks before he acts.

Get hold of some good literature, read up on the subject of egg production, apply the knowledge you thus obtain, and in the end you will learn to experience a keen delight in every cackle of your hens.

Your hen wants to cackle—she will cackle if you give her a chance.

And there's money in the cackle of a hen.

You get the proof at milking time



Silage fed cows produce about 25 per cent more milk than those on dry feed. Ask any farmer who has an Ideal Green Feed Silo what he knows about it. He gets positive proof of the superior feeding value of good silage at every milking. Yet silage costs no more than other feed. In fact, it costs 15 to 20 per cent less. But remember this: the feeding value of silage is determined to a very great extent by the silo. Good silage can only be produced in a good silo.

IDEAL GREEN FEED SILOS

have proved their right to the confidence they enjoy among thousands of Canadian users by the service they have given for many years. At every milking time, the man who has an Ideal gets unquestionable proof of the wisdom of his silo choice.

A "cheap" silo or a silo erected from "cheap" material will prove the most costly you can buy. The few dollars you might save on the first cost by buying such a silo will be lost many times over in the poor quality of the silage, the trouble and expense you will be put to in keeping the silo in repair and in its short life.

An Ideal will pay for itself in one year and last many years. It will preserve the silage perfectly. It will return the biggest profit on the money you invest in it.

Get all the facts that prove that the Ideal gives you more for your money than any other. It costs nothing to get this information and doing so will be the means of insuring silo satisfaction for you and will save you many dollars. Write today for catalogues and complete information.

BREAKING UP BROODY HENS

A hen is one of the most jealous creatures, and if placed in a wire-sided coop where she can see the rest of the flock ranging about the yard she is very restless, especially if there is a male with the flock frequently calling his mates to partake of a choice morsel of food, and if plenty of food and water are supplied she eats often, thereby keeping her body built up so she goes to laying again in a short time.

The plan followed here at the experiment station is to place the hen in this kind of coop on the day after she remains on the nest and does not lay; she is kept in the coop four days, and then released. During the time she is left in the coop she is given all the feed and water she wants. About 4000 hens are treated in this way each summer at this place. The records show that hens broken in this way begin laying again as follows:

The time from the laying the last egg till the hen began laying again was 10 days in March, 8 days in April, 10 days in May, and 12 days in June. There were more broody hens in June than in April, but for practical purposes we might say the average is 10 days. These coops can be easily built by any one out of scrap lumber and a little wire.—T. E. Quisenberry, Missouri.

EGGS IN WATER GLASS

The best method of preserving eggs for home use, or for sale in a limited way, is to pack them in water-tight vessels and cover them with a solution of water glass. Cover the vessel and keep it in a cool, dark place to prevent evaporation. Only fresh eggs and those with clean, sound shells can be preserved. Those with dirty shells, even when carefully washed, will not keep well. A few dirty eggs in the vessel may spoil the entire lot.

Stone crocks holding not over 10 gallons make the best vessels. The eggs should be put in daily as gathered, but one can hold them for several days. Many village and city housekeepers buy a crate or two of eggs in the spring when they are the cheapest and preserve them in water glass. Estimate three dozen eggs to each gallon capacity of the vessel. The liquid water glass, or silicate of soda, which can be purchased at most drug stores for 15 to 30 cents per quart, is used for this purpose, one quart with 10 quarts of pure water. Rain water or boiled water is preferred.

Old hens are the cause of low averages in egg production. The pullets work regularly, a Chicago farm paper says, but the old hens lay about a dozen eggs and rest the remainder of the year.

Unless you are raising a particular stock of chickens of which you have only a few hens, you cannot afford to keep the old hens as layers. A hen is not profitable after her third summer as a layer. Selling the old hens and using the incubator for hatching is the best plan for the small poultryman.

"Selfish" Uncle Joe

Uncle Joe was busily engaged uprooting weeds in his well-kept garden one beautiful morning in the latter part of the month of May. The merry birds were singing and flitting among the fragrant apple blossoms, the starry dandelions gleamed brightly through the dark green grass, and all nature seemed harmonious and smiling in the light of the morning sun.

But notwithstanding all this freshness and beauty of scenery, the countenance of Uncle Joe showed unmistakable signs of disquiet. The Rev. Hatfield, who was taking his usual morning stroll, espied Uncle Joe at work in his little garden, and crossed over to have a few words with him. The following conversation took place:

"Good morning, Uncle Joe. How are you this beautiful morning?"

"I'm mighty bad this mornin', Parson. 'There's no peace for the wicked,' the Good Book says, and I believe it for sartin."

"Why, what new trouble have you got into, Uncle Joe? You are looking well, and your premises are as clean as a new pin."

"Things that's clean on the outside, Parson, ain't allers so clean on the inside, you said las' Sunday. Oh, that sermon hit me monstrous hard, Parson. Did you mean it a purpose for me? 'Cause I ain't wuth it."

"No, no, Uncle Joe, I never thought of you. But tell me what's the matter this morning in particular."

"Nothin', Parson, more'n common. I was jest wonderin', when you come along, how wicked a pusson'd have to be for Catan to claim him. I've heard say that when a body got as bad as he could be the Old One would come for him. What makes you laff, Parson? 'Tain't no laffin' matter with me, I tell ye."

"Oh, Uncle Joe, poor Uncle Joe! I consider you one of my very best parishioners, and I can but smile to see you so depreciate yourself. What is the matter with you?"

"Oh, I've done so many awful things, Parson."

"You haven't killed anybody, have you, Uncle Joe?"

"Not yet."

"Nor stole anything?"

"Law, no."

"Nor told any lies?"

"I've 'quivocated, 'n' that's jest as bad, you say."

"Well, suppose you don't do that any more. Then how do you stand?"

"Oh, Parson, I've done some awful mean things. T'other day, when we had eels for dinner, I cleaned out the most of them, though I knowed all the time t'others liked them as well as I did. Then again, comin' home from the store las' night, I had two bananas for Betsy (that's my ole woman), an' I jest thought I'd eat one; and it tasted so good, and I was so hungry, that I bolted both of 'em 'fore I thought."

"Well, Uncle Joe, how about that sick man you took care of every night last week, and worked every day just the same?"

"Oh, that was only ole Rastus. He ain't got nobody to see after him, so I had to. 'Twa'n't no credit to me."

"Who went without his dinner of soup, sweet corn, and potatoes, and carried it to poor Widow Clark?"

"I did, for I knowed she was starvin', and I couldn't 'a' slept a wink if I hadn't, so ye see that was nothin' but selfishness."

"Pity there were not a few more selfish ones, then, I think, Uncle Joe."

"Oh, there's plenty, I suppose, jest like me, Parson, maybe worse, but they must sihn for theirselves, same's I do."

"I heard you walked six miles, Uncle Joe, to let Jim Smithers know he was going to be warned out of his house because he couldn't pay his rent, and that you gave him a month's rent so he could stay."

"Yes. His wife was sick. 'Twould 'a' killed her to be turned out, and I should 'a' been a murderer then, sure, so that's why I had to do that, ye see. I couldn't stand that on top of everything else, Parson."

"Don't you think you did a good deed then, Uncle Joe?"

"Oh, I s'pose 'twas, for them; but I done it to get me out of the scrape, ye see. I couldn't eat nor sleep for thinkin' 'bout 'em, and knowin' I could get 'em out o' trouble, and I've got to eat my rations an' sleep by night or I can't work by day. Nothin' but selfishness, ye, see. Now, Parson, you don't really think I'm any better for doin' them things, do you?"

"Yes, Uncle Joe, I do; I think you are a right-down splendid, kind-hearted old fellow, and I respect you, and I want you to be happy."

"Heavens and earth, Parson! How is a man to be happy with so much misery on his hands all around, hey? That's what makes me want to be rich—I'd help some on 'em along, I tell ye! But what can an old, miserable, elfish, poverty-struck repperbate do?"

"I think you do a great deal of good, Uncle Joe, and for what you can't do God will take the will for the deed. He tells us so in His word."

"But, ye see, this 'will for the deed' business don't help them that's in trouble, Parson. I hear folks in prayer meetin' tell how happy they are, and I can't help thinkin' they no business to be. It sounds 'mazin' selfish, to my thinkin', this gettin' yerself all high and dry, and leavin' everybody else down in the muck. 'Pears to me it's the confoundedest kind of religion, and I ain't got it."

"No, I know that, Uncle Joe."

"Mind ye, 'tain't to my credit. I say it, Parson: I can't help it."

"Oh, I suppose not, Uncle Joe; and so, when Jack Haley broke his leg and was laid up last winter, after he had killed your dog and stolen your melons, you hauled him a load of wood, cut it, and carried it into the house for him, I hear. Seems to me that looks like loving your enemies, Uncle Joe, hey?"

"No, sir-ee, that's where the shoe pinches. I don't love that tarnal critter one bit, nor can't, but there was his poor wife an' child'en, cold and hungry, and I jest had to warm 'em up, ye see."

"And you carried Jack himself warm blankets, and things to make him comfortable, and beef brother to strengthen him, and I don't know what all."

"Oh, that was to get the poor devil well, so I shouldn't have to take care of his family—see? 'Twa'n't on account of loving him, by a long shot, I can tell ye. 'Twas jest for my own benefit."

"Well, Uncle Joe, you do beat all! According to your account, you have never done anything from a right motive in your life."

"Not that I can remember on, Parson. Ye see, everything that I ever said or done for other folks is jest to make myself feel better—that's all. If that ain't clear, sheer selfishness, what is it? I don't love my enemies—not Scripter fashion—an' I'm allers pokin' round and gettin' into trouble, on other folks' account, when I ought to be mindin' my own business."

"I guess I can mention one thing you do that is right, Uncle Joe: you are a constant attendant at church, I notice, and a good listener."

"Yes; that's to find out what else I can do for myself, Parson. But I don't understand some things I hear."

"What is one, Uncle Joe?"

"Folks says 'Be good, and you'll be happy.' I dunno's that's Scripter, but folks says that. Now, I think if I was good I should be miserabler than I be now, 'cause I should pity poor devils so much that I should have to let all my work slide and tend right to 'em."

"Oh, no, no, Uncle Joe; take my advice: read the Bible more, and do as it tells you, and I am sure you will not be so troubled. Provide for your own household first. You know, 'he that does not provide for his own house,' Scripture says, 'is worse than an infidel.'"

"That's it; I'm worse than an infidel, no doubt. Oh, I'm selfish to the core, and I don't see my way out of it at all, Parson. But I'll take your advice and read my Bible more, and perhaps I may learn somethin' yet. Thank ye, kindly, Parson; you've encouraged me up finely, and no mistake."

"All right; I'm glad to hear it. I shall know whom to call on when I am sick or in trouble, Uncle Joe."

"Sure, Parson, sure; I'll be there."

The parson went on his way, meditating on the virtues of this singular character, while Uncle Joe turned and went into the house, muttering to himself: "Must hurry up and get down to Sile Rollinses, and fix his bandages. He says I don't hurt him like the others, so I feel obliged to tend to that all the time. Oh, I forgot my breakfast—never mind—eat when I get back—any time—sick folks fust—so's to feel better myself. Selfish! Selfish!"—Laura Tripp Allen.

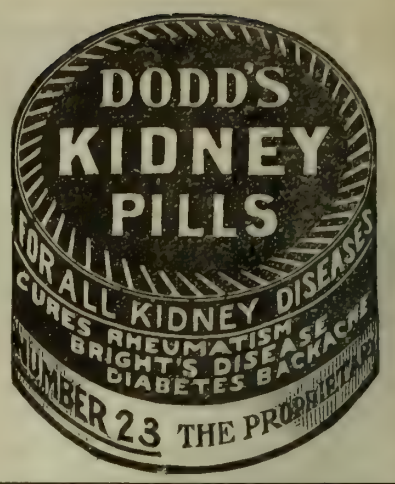
BETTER THAN SPANKING

Spanking does not cure children of bedwetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

NO OTHER INVESTMENT PAYS LIKE KINDNESS

How few there are who estimate aright the power of kindly words and deeds! And yet what mortal being has not at some time or other felt their benefit and sweetness? Without their gentle influence life's cares and perplexities would harden, and its trials and sorrows would soon wither and blight the heart. Every kind word said to a dumb animal or bird makes the speaker happier. Speak kindly to a dog and caress him, and a change will come over him instantly. From a growling canine he will be transformed into a gentle, submissive dog, whose wagging tail and kindly speaking eye show that he is your friend.

A well cared for horse or cow that hears only kind words will be a great deal more willing to heed the wishes of its master than one that hears only shouts and rebukes.



Ella Wheeler Wilcox has echoed the thoughts of human hearts when she said:

Let me be kind to weaker things of earth,
And love them onward to a higher birth,
And let my patience and my cheerfulness
Life's common pathways beautify and bless.

Kind words and deeds shown to one's friends will in due time create in them the same spirit of kindness and generosity, for, "As in water face answereth face, so the heart of man to man."

Every kind act or kind word is carried onward. As a wave in the ocean creates new waves, even so will a kind deed generate more kindness in the heart to which it is shown. The secret of hapiness is to forget ourselves and learn to think of others.

There are many people whom we meet in our daily walks of life who are

PAINS IN SIDE AND BACK

How Mrs. Kelly Suffered and How She was Cured.

Burlington, Wis.—"I was very irregular, and had pains in my side and back, but after taking Lydia E. Pinkham's Vegetable Compound Tablets and using two bottles of the Sanative Wash I am fully convinced that I am entirely cured of these troubles, and feel better all over. I know your remedies have done me worlds of good and I hope every suffering woman will give them a trial."—Mrs. ANNA KELLY, 710 Chestnut Street, Burlington, Wis.

The many convincing testimonials constantly published in the newspapers ought to be proof enough to women who suffer from those distressing ills peculiar to their sex that Lydia E. Pinkham's Vegetable Compound is the medicine they need.

This good old root and herb remedy has proved unequalled for these dreadful ills; it contains what is needed to restore woman's health and strength.

If there is any peculiarity in your case requiring special advice, write the Lydia E. Pinkham Medicine Co. (confidential), Lynn, Mass., for free advice.

hungry for a kind and cheering word. The old-fashioned ways of our parents and grandparents were by far the best. How many pleasant hours they brought to their neighbors by friendly chats concerning their domestic affairs, or the kindly interest manifested in the joys and sorrows of others. When one enquires about the absent son or daughter it is a comfort to the mother's lonely heart to feel that somebody else cares for that which means so much to her.

There is no investment which pays like kindness. It brings in a dividend of happiness from the very beginning because it pays compound interest in pleasant memories and true friendships. There is no better way in which to invest time and strength than in helping others.

"Now is the time! No longer wait to scatter loving smiles and words of cheer to those around whose lives are lone and sad."

SELECTING WALLPAPER FOR COUNTRY HOMES

Shades of Yellow, Cream, Tan, or Warm Gray, with Touch of Rose, Are Always Attractive

About this time of the year a good many women are thinking about selecting wallpaper for their rooms. Some have grown tired of their color scheme and desire a change, while others will paper their walls for the first time.

In either case the matter is given considerable thought, and this is wise, for people usually have to live in their rooms a long time after the walls have been decorated anew, and they have come to understand that the decoration of rooms on walls and ceiling either makes or mars the beauty of home and home life, for it is a fact that the colors in decorations do affect one's spirits and dispositions.

For instance, red excites and stimulates, and is never a restful color in our sleeping or living rooms; while of green we usually have plenty out of doors in summer, though blue-greens and sage greens may be used on some soft-toned backgrounds. Yellow is a pleasant color for rooms with a northern outlook. It gives a sunshiny atmosphere, and one cannot get gloomy in a room with walls of warm yellow, but it must be remembered that there are yellows and yellows. There is a creamy tone that is suave and gracious, and a rosy yellow that is smiling and gay and full of sunshine, and just the color for the family living room.

Then, too, one never makes a mistake in selecting a warm tan, a delicate wood shade, or the warm gray that just now is so popular when brightened up with a touch of rose. Brown, buff, cream, and tan are longtime favorites of which we do not tire, and of these there are many shades which it is well to carefully consider. These colors make a good background for pictures, and are restful and durable. It is a mistake to select cheap paper with fold decorations, as the gold blackens unpleasantly with age. Blue is a heavenly color, but not for walls, unless it is the pale blue and white used in bedrooms, and then it should be a soft blue-gray.

ATTRACTIVE ATTIRE FOR THE HOUSEWIFE

Pretty Wash Dresses of Pale Pink, Blue, or Lavender Always Look Fresh and Good

Many women adept in selecting street clothes fall short in the matter of choosing suitable garments for wear in the kitchen. They think torn, soiled shirt waists, half-worn skirts, and buttonless, down-at-the-heels boots good enough for the kitchen; or they wear the cheap, ugly frocks and aprons that are sold in numberless thousands. They look untidy, and there is no excuse.

Unless laundry work or scrubbing is to be done, there is no reason why working clothes should not be as pretty as other clothes. This does not mean as expensive, but prettier materials can be bought for the same money. If women will search the wash-goods counters they will find a bewildering array of pretty prints, ginghams, linens, crepes, batistes, and lawns, all low in price, and many suitable for house wear.

A pale pink, blue, or lavender dress is much more to be desired than an ugly dark one. Trimmed with bits of moderately priced lace, it can be made to look far removed from the tiresome wrapper or house dress of coarse material and outlandish fashion. The same with aprons. Why homely materials when there are so many light checks and figured cloths that can be made into bungalow aprons or jaunty breakfast, afternoon, or tea aprons?

Women—young women especially—should see that their house dresses and aprons are fresh and good to look at. Light-colored clothes are just as easy to launder as dark, and they have the added advantage of looking prettier after ironing. It pays to look fresh, crisp, and clean when engaged in household duties.

PEANUT BUTTER IS A NUTRITIOUS FOOD

But is Best Used in Combination with Other Food Materials

Peanut butter is a very nutritious food. Generally speaking, it is three times as nourishing as beef, mutton, or veal, and costs usually only one-half. Because of the high food value peanut butter should be used moderately. Since it is such a concentrated food, it is apt to cause digestive disturbances unless it is used in small quantities with other foods.

Peanut butter lends itself to a great variety of dishes in the prepartion of foods. It is easy to use, and does not necessarily require cooking. On account of its high food value, peanut butter should be used in combination with other food materials. Its high fat and protein content make it desirable for a meat substitute, and it may be served in palatable dishes such as peanut butter loaf, croquettes or chops. Since one-half of peanut butter is fat or oil, it can be used as shortening in muffins, cookies, cake and bread. Its nutty flavor is pleasing in candies, frostings, cakes, and salads.

Following are a number of recipes in which peanut butter is used:

Peanut Butter Loaf—1 cup peanut butter, 1 cup hot water or milk, 2 cups bread crumbs, 1 tablespoonful salt, 2 tablespoonfuls sage. Cream the butter and liquid. Add seasoning and bread crumbs. Bake in bread tin or casserole for one-half hour. Serve with sauce. This recipe is sufficient for six or seven.

Peanut Butter Croquettes—One-half cup peanut butter, one-half cup hot water, one-half tablespoonful salt, one minced onion or 1 tablespoonful sage, 1 cup bread crumbs. Cream the butter and water. Add the seasonings and enough bread or cracker crumbs to form into cakes. Fry in deep or shallow fat. Serve with tomato sauce.

Peanut Butter Chops—One-half cup peanut butter. Cream butter and milk and add powdered sugar until mixture will spread nicely on cake. This frosting may be used to fill dates.

Note—All measures level.

CHILDREN'S PLAYGROUND

Why not make a playground for the children in some pretty nook of woodland, where there is a tiny stream of water, and tall trees to ward off the sun's heat? Clear the place of briars and undergrowth that would harbor any possible poisonous reptile, put up a few slab benches, a low seew-saw, and perhaps a safe swing or two, nail some poles around it from tree to tree, to prevent intrusion of cattle—and the thing is complete.

Children love a place like this. It is their very own. They hew and whittle to their heart's content. Kites are made without bothering about the litter, paper dolls are "cut out," scrap books are pasted, and toys are scattered in a reckless abandon, without fear of reproof from mother. Lunches are served in tiny dishes, and the crumbs are left for the chirping birds to make a supper for themselves.

Give the youngsters a playground under the trees at home. It will keep them out of mischief and relieve the busy mother during the hot days of summer. The house can be kept in better order, and more work can be accomplished by the mother.

She Did Not Heed the Danger Signals

BUT DODD'S KIDNEY PILLS CURED HER DIABETES

Mrs. McDonald Might Have Saved Herself Months of Pain, Sleeplessness and Anxiety by Using Dodd's Kidney Pills Earlier.

Grand Narrows, Victoria Co., N. S., June 15 (Special).—That Dodd's Kidney Pills will cure kidney disease in its worst form is evidenced by the case of Mrs. Roderick McDonald, an estimable resident of this place. Mrs. McDonald suffered from diabetes for two years, and found her first relief in Dodd's Kidney Pills.

"I am sure I would be in my grave today but for Dodd's Kidney Pills," Mrs. McDonald states. "The doctor attended me for five months for diabetes, but I was worse when I stopped taking his medicine than when I started. I could not get a wink of sleep.

"As soon as I started taking Dodd's Kidney Pills I fell in a solid sleep for one hour, and soon I got so that I could sleep fine.

"Dodd's Kidney Pills have done so much for me that I feel like recommending them to everybody."

Mrs. McDonald states that her earlier symptoms were shortness of breath, dizziness, backache and a bitter taste in her mouth in the morning. All these are symptoms of kidney trouble—danger signals that no one can afford to neglect. Had she heeded them and taken Dodd's Kidney Pills she would have saved herself months of pain and anxiety.

CONSUMPTION

The history of consumption begins many years before the birth of Christ. At that time it was recognized that the disease was contagious, although people were ignorant of its cause. But the treatment was country air, sea voyages, high, dry climates, and living in pine forests. In our days the disease is known as consumption, tuberculosis, phthisis, and "the great white plague."

The germ of consumption was discovered in 1882, and since that time progress in treatment has been more rapid. The germs of tuberculosis are exceedingly small, as germs go, and they multiply rapidly within the body. They are difficult to kill with antiseptics. Nor are they destroyed by medicines of such kinds and strength as can be taken into the system. The germs are not killed by freezing. Even if they become perfectly dried out, it may require months before they lose their vitality. But when exposed to sunlight and fresh air they are destroyed in a few days, or sometimes even in a few hours.

We do not inherit tuberculosis from our parents. Whether a predisposition or weakness is transmitted from parent to child is not known. There is really little evidence that such is the case.

The germs of tuberculosis are abundant in every community. There are always cases from which the infection may be spread, but it requires something more than the germs to give us tuberculosis. Every individual of mature years can be reasonably sure that he or she has at some time taken into the system very many of these germs. It would be impossible to avoid them entirely, because of their great abundance in the air, food, and water.

The fact that we take germs of any knid into our body does not of necessity result in developing disease. If we lack resistance the infection may develop. If we are normally resistant and in good health almost any quantity or kind of germs cannot infect us.

By this we may know that it requires something more than the mere entrance of consumption germs into our body to give us the disease. Consumption is not necessarily fatal. It is a curable disease. It is just as curable as typhoid fever, except that it requires years instead of weeks to effect a cure.

Not every person afflicted with tuberculosis can recover, because some people lack inherent body resistance, or by habits and diseased organs have lost the normal power to resist microbic infection.

In the treatment of tuberculosis two things are vitally important. The patient must preserve the body strength, and he or she must live in the fresh air. Many other things are necessary, but these are most important. To overtax the physical strength when weakened by this wasting disease is almost suicide. To avoid the outdoors and fresh air seals one's doom.

Becoming infected with tuberculosis need not deprive us of all hope, for there is within our body a mighty ally with which to make war upon these invading microbes. There is in our blood a great multitude of white blood corpuscles, known as leucocytes. These leucocytes are the standing army of our bodies, by means of which we defend our system against the invasion of disease germs. When an injury to the tissues occurs there is placed around the wound a guard of leucocytes, which prevents the germs from passing into the deeper tissues. If the germs overpower the leucocytes or destroy them, as they sometimes do, the defence of the body is gone, and most likely the germs will pass into the deeper tissues, and blood poison will result. If the leucocytes defend the system successfully the injury recovers in a few days, or may go unobserved altogether.

The size and efficiency of this leucocyte army of defence fortunately do not depend upon congress. But it does depend upon you. It depends upon the way you have lived. If your system is in good condition this army will be active and efficient. If the body has been abused by dissipation, rich, indigestible foods, lack of exercise and fresh air, your fighting force will be a poor makeshift that cannot defend you in time of need.

This ability to destroy germs is known as body resistance to disease. Persons who live rightly have this power highly developed, and are rarely sick. Those who are frequently sick have destroyed this resistance by their bad habits of living. In a fight for life and health every organ and every function must do its share to assist

Good-by, Guess Work

THE New Sharples "Suction-Feed" is the only cream separator which eliminates guess work from cream production. All other separators have to be turned at exactly the speed indicated on the crank or they will lose from 7 to 13 pounds of butterfat per cow per year. The Purdue Experiment Station and other scientific investigators have proven these figures (see Bulletin No. 116, Vol. 13.)

This "guess" speed is used by 19 operators out of 20, because it is impossible to turn the crank at exactly the right speed.—It is much easier to turn it slower—and, whenever you do, you lose cream. Even a speed indicator will help but very little, as you won't and can't watch it every minute.

So we say to you dairymen: Quit guessing about your separator speed and your separator profits. Use

THE NEW SHARPLES SUCTION-FEED

Separator and know that you get *all the cream all the time.*

Whether you turn faster or slower, the bowl of the Suction-Feed *drinks in just the right quantity of milk.* The feature is entirely automatic; if you are tired, you turn slower (which is easier) and, if in a hurry, you turn faster and finish so much sooner. No matter how you turn, the New Sharples always skims clean.

The Sharples cream is always of *even thickness,* whether you turn fast or slow. The Supply can is but knee high so you can fill it without any back breaking effort. The three-piece Sharples bowl is lighter and simpler than any other—*no discs to wash.*

All these money-saving and trouble-preventing features are described in a handsome catalogue; ***"Velvet" for Dairymen.*** Send for a copy, now, while you think of it. Address Dept. 79

The Sharples Separator Co.

Clean to handle. Sold by all Druggists, Grocers and General Stores.

the body in eliminating the added poison from the tubercular lesion.

If you would recover from a disease of this kind you must be a good fighter. Do everything that will destroy the microbes within you, for your own sake. Do all that you can to protect those of your family and friends who are jeopardizing their life and health for you. No one thing will cure you. Medicine will not effect a cure, but it is sometimes necessary to assist the body functions. It is ammunition to the army of defence. Recovery is possible, as many have recovered to live useful, happy lives to old age. But you must not neglect any one thing.

Tuberculosis is less deadly than it has been heretofore, because we know more about treating the disease. But the germs are no less virulent. By improved sanitation the germs will be better destroyed and the infection less prevalent. By a better understanding of the disease and the way in which it is acquired the public will be better able to avoid infection. By keeping our bodies perfectly healthy our resistance can be increased.

Body resistance, or ability to withstand infection, is dependent upon the activity of the body functions, and body functions depend upon the care we exercise in our eating, drinking, working and playing.

About the Treatment

If you were told you had tuberculosis you naturally would feel depressed. Perhaps you would cry, or curse, depending upon your temperament. Then you would think seriously.

Formerly the first thought was a change of climate, and visions would appear of that great, wide west, with high mountains and broad plains—a land of dry winds and bright sunshine, so destructive to the germs of consumption. But in that golden west, so blest with health-giving climate, there are many hardships for the invalid. Everything must be bought with a price, and there are many things needed in the desert country that money cannot buy.

To one accustomed to the green fields and fertile farms of the east, with its abundant rainfall, these dry, sandy plains of sage and cactus soon lose their attractiveness. Rugged mountains and painted canyons cannot for long replace the home surroundings, be they ever so humble. There will steal into the soul an uneasiness which no scenery can replace, and it requires a will more adamant than the very cliffs to conquer this restless longing for home and loved ones, so destructive to recovery.

Fortunately it is no longer necessary that you go far from home. Many states have free sanitariums where you can be cured at little or no expense, and be within easy reach of friends.

The treatment of tuberculosis is reconstructive rather than medicinal. It is hygiene and diet, not drugs. Medicines alone are useless and serve only to assist the body functions, and if you are being wisely treated drugs will receive very little consideration. Let me repeat: medicines are almost useless in treating and curing consumption except to relieve certain distressing complications.

Your ability to digest and assimilate foods will determine your recovery. Usually the digestive organs will perform the work well and good, provided you are knowingly advised by an expert in this line. If your doctor tells you he can cure you with medicines, go immediately to another doctor. And let me say again that medicines have failed utterly as a cure, regardless of what you may read in advertisements. Medical science has discovered no specific other than pure air and sunshine, along with nourishing foods and rest from physical exertion. Therefore live in the pure air at all times.

If these things will destroy the germs of consumption after they have invaded the body, how easily, by using this same pure air and careful living, could we keep our bodies too resistant for the tuberculosis germs to gain a foothold.

In the treatment sound common sense must be used at all times, and the hours spent outdoors must be varied according to the weather and the season. The tent life is advisable, provided the tent is constructed with windows or other means of ventilation. The ordinary canvas tent that will protect against rain is too closely woven to allow sufficient interchange of air within. So that the popular tent idea is good only when some other more suitable arrangements cannot be provided.

The object of the fresh-air treatment is to keep the body functions more acute by perfect oxidation. By supplying a large amount of fresh air the tissues are better prepared for encapsulating tubercular germs, by which process they are rendered inactive. So long as the resistance is sufficiently high the germs will be held at bay until the wounds can heal and form sear tissue. These scars will imprison the germs until each time as lax habits and dissipation will again weaken the body and give them mastery over the protecting cell walls.

In the matter of foods it is useless to attempt dieting and forced feeding, except under directions of an experienced dietitian. The doctor in general practice lacks training along this line. Without forced feeding at the critical times you cannot build up your wasted muscles and nerves. Rich foods and an abundance of them are necessary, but they must be taken regularly and according to directions as to time and amounts. Otherwise the stomach will become deranged and a serious damage result.

Rest is necessary. It is just as important in the upbuilding process as the foods. To overtax the physical body when the system is struggling for mastery over the invading germs may turn victory into defeat. In the early part of the disease days in bed are well-spent days, provided you are breathing pure air and being sustained by suitable foods. Later in the treatment exercise is desirable, but such a thing as work must not be considered until you have fully recovered.

Being treated in a sanitarium is better than attempting it in your own home. It matters not if you are wealthy, you cannot have the rigid, careful, trained nursing, feeding, and enforced rest that is provided in the better institutions given over to this kind of work. By all means go to one of them until you get beyond the danger mark in recovery, and by so doing you will enlarge your chances of getting well, and at the same time will learn what to do, and—most of all—what not to do. The aversion to such an institution is soon dispelled, and the advantages are far beyond the necessary cost to one fighting for his life.

Cough is usually present in tuberculosis of the lungs and throat. By it the poisonous matter is thrown out. This is a benefit to the patient, but a menace to the public. Since this expectorated matter contains millions of the tubercular germs, it is important that it be burned. No other disposition of it is safe. Antiseptics are too uncertain. The spittle should be caught in cups made for the purpose, or in gauze napkins, which can be burned before they become dry.

Fever, which is usually present, is due to the absorption of the toxic substances. It has little significance and will disappear with improvement in health. It can be safely disregarded. Chills and night sweats are due to the same general cause. They will disappear quickly when the system is freed from the poisons of the tubercular lesion.

I have told you little in detail of treatment and diet. The seriousness of this disease does not warrant any wasting of time in home treatment. You require the skill of doctors and nurses who are trained in this work at the earliest possible moment. You cannot yourself cope with such a disease, and recovery is yours if you will but go about it in the right way. Unfortunately, not every one can get well, because some persons lack that force of character and stick-to-it-iveness to carry the treatment to a successful recovery. But they are the exception.

To review briefly: The treatment of consumption is not by medicines. Food, fresh air, and preservation of the body energy will effect a cure. Should you become infected, go at once to a sanitarium devoted to the treatment of this disease. After a few months' training you may be permitted to continue the treatment at your home. You will have learned how to eat and sleep and rest, how to care for the body, and how to protect those about you. You will have learned the secrets of right living. After you have learned these things and improved sufficiently in health, it may be advisable to seek a drier atmosphere and more sunshine, where with the aid of good climate you may with reasonable assurance live out your allotted three score years and ten.—Julian Clarke, M.D., in New England Farm and Home.

Send for our New Cook Book

MAKING THE HOUSEKEEPING EASIER

At exhibits of model kitchens or displays of the latest labor saving devices I often hear women remark: "Oh, if I only could afford those machines, and have every new thing that comes out, I would be able to make my housework easier."

But I have repeatly found it true that it is not an array of housekeeping tools and devices which is needed to make work easier. The most important thing is, first, for the woman to study her own home or the conditions surrounding her work. The second thing is for her to watch herself at work and the methods that she uses.

In other words, housekeeping can be made easier by better arrangements and better methods; it does not depend on expensive tools and equipment entirely.

Since 70 per cent of all the time given to housework is generally spent in the kitchen, or on cooking and serving meals, it is in the kitchen that we must begin to simplify housework. Why is it that kitchen work takes so much time and is considered the most drudgifying perhaps of all housework? First, because the kitchen is usually not arranged for the comfort of the worker.

"But my kitchen was built this way—we can't afford to rebuild it," is a frequent protest. It is true that most kitchens, being built by men, who do not work in them, come with shelves too high and sinks that are too low, and are built without any consideration of the work to be done in them. But even if we do not own our home, an understanding of how a kitchen should be arranged to save steps and work will help every homemaker. A step-saving kitchen does not necessarily mean expense. It only means a better arrangement based on the work that is done in it.

The second thing which makes housekeeping easier is better methods of work. This means trying to find how to do any one task in a simpler, easier way. There is room for improvement even in the traditional drudgery of dish washing! Or in making beds, or preparing vegetables, there is a way that is hard and a way that is easy. It is finding this easiest way which makes housework less fatiguing. For example, dish washing is unpleasant mainly because the sink is so low we have to bend, or it may be so shallow that the water slops over, or the drain may be placed so that the work is awkward, or the sink may be in a dark, unventilated corner. By changing these conditions, and your method of work, using the right temperature of water so that dishes drain themselves, much of the drudgery will be eliminated, and the time cut down perhaps from forty-five to twenty-five minutes.

Any housekeeper, in however moderate circumstances, can follow the ideas of the "new housekeeping" because they depend on her skill and not on expensive equipment alone.

POINTED PARAGRAPHS

One way to make friends—keep advice to yourself.

The supply of common sense never exceeds the demand.

A miser is a great lover of generosity—in everybody except himself.

Many a man doesn't realize what he is up to until he is called down.

DIARRHOEA

Was Caused By Change of Diet, Etc.

Diarrhoea arises from many causes such as, change of diet, change of water, change of climate, catching cold, the eating of unripe fruits, or anything that will cause or induce an excess of bile.

On the first sign of any looseness of the bowels it should not be neglected, but should be looked after immediately, for if not diarrhoea, dysentery or some other serious bowel complaint may ensue.

Mr. Geo. Smith, Victoria, B.C., writes: "It is five years ago since I first tried Dr. Fowler's Extract of Wild Strawberry. I was then on a timber survey, and suffered greatly from diarrhoea, caused by change of diet, etc. A friend in the party gave me a few doses which gave me great relief. Since then I have been in survey work, and would as soon think of starting out on a trip without my compass and blankets as without my supply of Dr. Fowler's Extract of Wild Strawberry, which I consider the woodsman's best friend."

Dr. Fowler's Extract of Wild Strawberry has been on the market for the past seventy years, and is universally known as a positive cure for all complaints arising from any looseness of the bowels.

When you ask for "Dr. Fowler's" be sure you receive what you ask for as there are many rank imitations of this sterling remedy placed on the market to try and fool the unsuspecting public.

The genuine is manufactured by The T. Milburn, Co., Limited, Toronto, Ont.

Price, 35 cents.

LABOR-SAVING DEVICES FOR THE HOME

Miss Eadie's exhibit of "Labor-saving Devices for the Home" at the Women's Convention held in the Manitoba Agricultural College February 16th, was most interesting.

Grouped around the big Assembly Hall were some twenty girls, students of the college, each exhibiting some one device to save labor. Here is a list of the articles shown:

1. Wooden spoon, for use in cooking acid foods; will not tarnish.

2. Spatulas, 2 sizes; these are soft flat knives used for scraping bowls, slipping pies, etc.

3. (a) Measuring cup. Each cup holds exactly 16 tablespoons.

3. (b) Regulation tablespoon.

3. (c) Regulation teaspoon.

Three teaspoons equal one tablespoon. Sixteen tablespoons equal one cup.

4. Home-made shelf—On hinge, so it will open and close. To be placed behind stove to hold extra pans, or be next sink to hold extra dishes.

5. Blocks of wood to place under bed posts to raise bed higher during sickness. Makes the nursing easier.

6. Pulley clothey line—Pulley costs 25c, wire line 25c.

7. Vacuum cleaner—Small hand size costs $7.00; sold by Reeves, Melford, Conn.

8. Cupboard for articles used in keeping the house clean. On a shelf were all bottles, such as furniture polish, metal polish, wood alcohol. Beneath was a place to hang each mop, broom, and dust pan. I noticed the carpet sweeper stood up on its side so as not to flatten the bristles; the broom hung upside down.

9. Design for farm woman's office. This contained a plain table, chair, waste paper basket. On the table stood a box containing 1,000 tickets. These can be bought at Eaton's for 75c a thousand. On these cards was kept family accounts. One section wa for recipes. Some kept count of lin ens, contents of pantry, things needed In fact, anything the housewife wanted to remember. On the table also was a flat basket holding things of the week, like bills, receipts, letters to answer, etc. On a shelf above were three files to hold accounts, correspon dence, and clippings.

10. The next exhibit was a plan for an ideal kitchen. On one side of the room were the things used in preparation of a meal—ice box, then kitchen cabinet, then stove and table. Then came the dining room door. On the other side of the room were things used in clearing away the meal—china cabinet and kitchen sink, with it draining table each side, one for dirty dishes, one for clean.

11. Next came a vacuum sweeper—used like a carpet sweeper.

12. A white kitchen stool that screwed up and down to the required height. This one is sold by Shander and Fisher, and costs $5.40. An old piano stool would do as well. This is useful to sit on when ironing or peeling vegetables.

13. A schedule or plan for a day's work in the home. Although the day runs from seven a.m. to seven p.m., the work is so planned that the housekeeper has three hours off each afternoon. This makes a nine-hour work day. Long enough for any one.

14. Next came asbestos holders for lifting things off the stove.

15. A small towel on a loop; the loop is of tape, and slips over the apron belt at the right side; very useful when cooking to wipe the fingers on.

16. A laundry cupboard holding all things needful for wash day and ironing day.

17. Adjustable table. The top could be raised or lowered to suit the size of the worker.

18. Stainless steel knives. They sell for $9.00 a dozen.

19. Sliding larder; to send food down to the cellar to keep cool—a dumb waiter.

20. Porch larder, screened and holding deliveries or other food, cool and away from flies.

21. Fireless cooker, home made. Just a tight box, with a lid on a hinge and plenty of loose excelsior. The simplest device of them all. Just bring the food to the boiling point, cover with pot lid, and pack in the excelsior, with more excelsior packed down on top. Shut the lid, and food will keep on cooking.

22. A kitchen table on legs for use in cooking. Gather materials on it, mix them, put on the stove, then push table and dirty dishes over to the sink. It saves many steps. The top should be of glass or oilcloth.

23. Dinner wagon—table with shelf to carry dinner into dining room and then use to bring out the dirty dishes.

24. Window larder—made of frame work of wood to fit an open window. Each side is covered with wire screen. One side opens with a door. Daily "left overs" are here kept cool and fly-proof.

Over in another building merchants were showing: Steam cookers, by which a whole meal can be cooked over one little lamp; manufacturer's fireless cookers that will roast meat or bake break, cook pies or brown anything; gasoline engines running the washing machine.

Before the exhibit closed Miss Eadie read a most interesting paper on the value of these in the home.

2 Miles to City

75 Acres—$2500

Stock, Crops, Tools Included

Here's one of the best little farms in Kennebec Valley; daily mail, near neighbors and school; a great hay and potato farm; machine-worked fields; cutting 45 tons hay; spring-watered pasture; abundance wood and fruit; attractive 7-room house, painted, with 2 barns and poultry house. Aged owner's wife is invalid and someone will get a big trade here. $2500 takes it and if you act quickly he will throw in pair good horses, cow, poultry, wagons, carriages, tools and household furniture, all in good condition; also 7 acres corn, potatoes and grain. Part down and easy terms to the right man. For full details see page 6, "Strout's Money-Making Farms," copy free. E. A. STROUT FARM AGENCY, Dept. 2612, 294 Washington St., Boston, Mass., Tel. Main 3348.

A SUMMER DANGER

Ptomaine poisoning is a form of illness which is entirely due to carelessness with regard to food, and therefore avoidable. Those numerous headaches, fits of heaviness, indigestion, listlessness, weariness, etc., which we put down to the heat, are far more often the results of slight ptomaine poisoning. Some microbes manufacture the ptomaine poison without creating any noticeable odor, and it is these which are the real danger. A small dose of powerful poison in a single mouthful of fish will make a person uncomfortable for the rest of the day and greatly reduce his power to work and his capacity for enjoyment. In the home, food should be kept in a cool, well-ventilated, and absolutely clean place. Anything that seems to be stale, or has the least sign of being tainted, should not be eaten. The foods about which we need to exercise the greatest caution are cold veal, sausages, pork, veal and ham pies, goose, duck, and venison kept for too long a time, mackerel, crab and other shell fish; but beef and mutton may also sometimes, though not often, be poisonous. A great deal of misconception prevails as to the effect of cooking. Cooking will kill the living microbes, but it will not remove the poison. Thoroughly cooked meat may therefore be dangerous, though it is in cold meats, pies, etc., we get most of the ptomaines. Cooked meat or fish put aside for a day or two often become unwholesome from the presence of ptomaine poison, and sometimes so much so as to cause serious illness. To escape this danger altogether is impossible, but every effort should be made during the summer to avoid eating food that is tainted, however slightly, and to be extremely careful about the cleanliness of the larder and all cooking vessels.

AIN'T IT FINE TODAY!

Douglas Malloch

Sure this world is full of trouble—
  I ain't said it ain't.
I have had enough, an' double,
  Reason for complaint.
Rain an' storm have come to fret me,
  Skies were often gray;
Thorns an' brambles have beset me
  On the road—but say,
  Ain't it fine to day!

What's the use of always weepin',
  Makin' trouble last?
What's the use of always keepin'
  Thinkin' of the past?
Each must have his tribulation,
  Water with his wine—
Life, it ain't no celebration.
  Trouble? I've had mine—
  But today is fine!

It's today that that I am livin',
  Not a month ago;
Havin', losin', takin', givin',
  As time wills it so.
Yesterday a cloud of sorrow
  Fell across the way;
It may rain again tomorrow,
  It may rain—but, say,
  Ain't it fine to day!

GERANIUM BEDS

A solid mass of scarlet geraniums is exceedingly ornamental, and there is

HOME 6Af' VV..er no more popular bedder for the lawn. I usuaiy pot two or three of my largest and healthiest bushes in the fall, and keep them over winter. In the spring I take a sharp knife and cut the plants in pieces for cuttings. I find tin pans filled with earth the most satisfactory thing to start these in, since the tin absorbs the heat, and thus the soil is kept warm. Pans about four inches deep are best. These should be filled with a soil mixture composed one part good garden soil, one part leaf mold, and two parts sand, but one must watch that they do not become dry. Put a little charcoal in the bottom of the pans for drainage. It will take cuttings about a week to come well rooted.

YOUR DAUGHTER'S CONFIDENCE

The best way to shut a girl's mouth when she comes to you with confidences about her lover, is to show that you are disturbed or offended by what she tells.

The very fact that she has told you is a thing to give thanks to God for, for it gives you a notion of what you must prepare to combat. If you object to what she has told you, convey your objections indirectly, make her condemn herself or him from her own mouth, call her own common sense into play, teach her to think for herself in this as in other matters.

A hasty outbreak may cost you her confidence forever and a day. Patience and tact, and tender, everlasting love will do for you and her what no amount of storming and force could do.—A Maine Mother.

CONSTIPATION DURING THE RUN-ABOUT AGE

In children of the "run-about" age the ideal treatment for constipation is administered through the diet. All meals should be at regular intervals. Add different laxative foods to the diet, such as porridge made of Graham flour and oatmeal, stewed fruits, rare scraped beef, and Graham, oatmeal, or Indian meal crackers. Remember that the more milk is heated the greater tendency it has to constipate. After the child is two years of age, reduce the total quantity of milk and give plenty of fresh vegetables, stewed fruits, and fruit juices. Plenty of butter is also good in overcoming costiveness at this age. Olive oil is excellent. Don't forget to give generous drinks of cool water between meals.

When dietetic measures fail and massage has been ineffective, we must get relief by other means. When the daily motion has not occurred, the simplest measure is the inection of several tablespoonfuls of warm water gently introduced into the bowel by a small rubber ball syringe. This will generally supply the needed stimulus for the natural emptying of the bowel. The soap stick or pencil of castile soap gently introduced into the bowel is often satisfactory.

An enema of two or three ounces of olive oil given through a soft rubber tube or catheter at bedtime will generally bring an evacuation after breakfast. A similar enema of glycerin will bring a more rapid result. Suppositories of gluten, glycerine, or soap are other means of temporary value. None of these measures, harmless as they are, should be adopted habitually, on account of forming a permanent bad habit by prolonged use. Above all, avoid the use of durgs—even the simplest laxatives or cathartics are not without danger.

Not So Bad

Silas—Did that city fellow have any luck with his vegetables last year?

Hiram—In a way. He got a sunstroke and collected $200 from a health insurance company.

They all come out of the "BEAVER" FLOUR Barrel

Apple Pie and Hot Rolls for supper—Jelly Roll and Chocolate Cake and delicious homemade Bread for dinner—Puddings and Doughnuts, and Cookies and Raisin Bread—all at their dantiest and best when made of

BEAVER FLOUR

MILLED OF BLENDED WHEAT

"Beaver" Flour is just as good for Pastry as for Bread. It is the product of Ontario winter wheat, blended with western spring wheat to increase the strength. "Beaver" Flour has the best qualities of both kinds of wheat—the whiteness, lightness, delicate flavour and perfect Pastry making qualities of Ontario winter wheat—coupled with the extra strength of western spring wheat. Being scientifically blended in exact proportions, the blended wheats are always the same in strength and quality—and so is the flour.

If you have never tried a blended flour, you cannot imagine what a difference there is between "Beaver" Flour and the usual western spring wheat flours. Get a sack of "Beaver" Flour at your dealer's, and try it for yourself.

THE CABBAGE ROOT MAGGOT—(PHORBIABRASSICAE BOUCHE)—AND ITS CONTROL IN CANADA

(Continued from page 595)

Dr. Aldrich has identified adult flies bred from radishes, cabbages, and cauliflowers at Agassiz, B. C., as Phorbia brassicae. We have no records of Phorbia planipalpis occurring injuriously in British Columbia.

Development—Number of Generations

We have found it an extremely difficult matter to determine with absolute accuracy the exact number of generations that occur in a season. In all our work with this insect we have not been able to breed a series of flies continuously through the entire summer from the progeny of flies reared from overwintering puparia. From the foregoing records of the life history of the insect we have observed that under conditions prevailing at Agassiz, B. C., the individual egg stage covered a period of from 2 to 10 days; the larval stage from 19 to 32 days; the puparium stage from 15 to 18 days and the adult stage from 3 to 9 days. Hence we gather that the length of the various stages from egg to adult covers a period of at least between 39 days and 69 days. As stated below, eggs may be continuous from that date until October 22, a period approxmiately of six months. At Ottawa, Ont., we have a minimum record of 37 days from the time the eggs were laid in spring until the fly appeared.

It would appear, therefore, on theoretical grounds and by analogy, that at least three generations, and possibly four, occur during the year in British Columbia. It is highly probable that in certain seasons a percentage of the puparia of the third generation pass the winter in such condition, the flies not emerging until the spring of the following year. As mentioned elsewhere, no flies emerged in an outside insectary after September 27, although emergence was continuous previous to that date.

First Generation.—The first generation arises from eggs deposited by flies emerging during the first favorable days of spring from overwintering puparia. The date when the first egg is laid varies considerably, according to the season. It has been observed that oviposition may commence in the first week of April (Agassiz, B. C.), provided weather conditions are suitable. In an ordinary season oviposition is well under way during the last quarter of that month. In eastern Canada (Ottawa, Ont.), however, where the season is more backward, oviposition has not been observed before the middle of May.

The period of emergence of those flies developing from overwintering puparia continues in accordance with the effect of the climatic conditions, but it is estimated that, as a rule, eggs may be deposted from these flies during a period of two months. For instance, if eggs were laid at Agassiz, B. C., on April 10, as they were in 1915, deposition by flies of the first generation continued until approximately June 1. In late or backward springs, however, the egg laying period would, of course, be extended.

Second Generation.—Taking the average of 54 days, which we think to be a fair period from egg to adult fly during the growing season, the flies of the second generation in the Lower Fraser Valley of British Columbia would commence to oviposit during the first week of June, and the flies developing from maggots from these eggs would begin to appear toward the end of July. It must be remembered, however, that individuals of this generation arising from belated flies of the first generation would continue to emerge most probably until the middle of September. Thus the eggs, larvae, puparia or adults of the second generation may occur any time between the first week of June and the middle of September under conditions prevailing at Agassiz, B. C., in 1915.

From the larvae which emerged from eggs deposited at Agassiz on April 10, puparia were formed on May 6, and adult flies appeared about the end of that month. Owing to the fact, however, that the egg laying period continues approximately until June 1, in seasons such as 1914 and 1915, the emergence of the flies developing from these late deposited eggs would be about July 10. Under absolute field conditions eggs were observed on plants on May 13 and the flies resulting from these eggs emerged on June 28, a period of 46 days from egg to adult. It must be remembered, however, as shown before, that the length of the life cycle of the insect varied from 39 to 69 days, the average of which is 54 days. In eastern Canada (Ottawa, Ont.), in 1910, numbers of flies of the first generation emerged in the laboratory from June 21 to June 27 from puparia collected in the field. The plants (cabbage and cauliflower) were transplanted on May 13 and the eggs laid about May 16. The length of the life cycle here varied from 36 to 42 days, the average being 39 days. In the same year Schoene found in New York State that the average individual life of the first generation was 55 days. This latter period agrees very closely with the average life cycle at Agassiz, B. C., as stated above.

Third Generation.—Using the period of 54 days, again, in which development may take place from the egg to the adult, it is posisble for eggs of the third generation to be deposited at the latter part of July, in such a season as experienced at Agrassiz, B. C., in 1915. Egg laying may continue until about the middle of September; thus maggots, puparia or adults developing from these eggs may be found through November and possibly December as well at Agassiz, B. C.

It should be fully realized, again, that the 54 days given as the period for development from egg to adult is arbitrary and merely taken for the sake of convenience in illustrating the overlapping generations. The actual period extends from 39 to 69 days (1915) according to our work, although Schoene has shown that the period in New York State may extend from 34 to 88 days (1910).

Thus any example of the insect occurring July 27 (1915), for instance, at Agassiz, B. C., may be the puparia or the adult of the first generation of eggs or maggots of the second or third generations. We have found eggs, maggots in all stages of development, and puparia, present in or near individual plants, at one and the same time.

Fourth Generation.—There is undoubtedly in the Lower Fraser Valley of British Columbia a fourth generation of the Cabbage Root Maggot. This may be either complete or partial, according to autumn climatic conditions. In 1915 at Agassiz, B. C., eggs were laid almost continuously every day from April 10 to October 22.

As already stated, there is a variation in the dates on which the first eggs are laid in spring in the provinces of British Columbia and Ontario. Therefore, due latitude must be allowed for the commencement and termination of the various generations.

The question of hibernation is discussed later in this article in its relation to the fourth generation, and probably to the third generation also.

(Continued in our next issue)

THE WOMAN OF TODAY

He was a true philosopher who said that the more fruitful a theme the greater the difficulty to write about it. Could there be any more abundant subject than the women of our land? And yet how difficult to say anything at once new and interesting. We can tell of incidents of heroic sacrifice, but to mention such things of a few is to ignore thousands of similar cases. We can tell of the woman who in order to gratify the desire of her sixteen-year-old son to join the colors went out and gathered in twelve recruits. Her deed was noble, marvelous in its motherly and patriotic devotion, but it cannot be emulated by all, and it is questionable if it is desirable that it should be. Other mothers have really done as much in sacrificing their only offspring and in dismissing them with a kiss and a fervent "God bless and guard you, my boy." It is the number of such sacrificial incidents that makes them difficult to dwell upon.

Yet there are many cases in which the mothers cannot bring themselves to make the divine sacrifice, and it is to be feared that usually in such instances they are not urged very strongly to do so—in other words, that the young men are perfectly satisfied to take shelter behind the maternal skirts. However, it is not of the men, but of the women and their work, that it is sought to speak. If they are not all Spartans they can each and every one render some service, or, to use a much hackneyed phrase, "do their bit." And the majority are doing it. In innumerable ways they are rendering service. There is probably not one of the hundreds of Women's Institutes in the country that is not working for some branch of helpfulness. There is not a woman's organization of any sort that is not in some manner contributing to the great cause. The questio nis: Can they do more?

As the war goes on and extends into the future the necessities will become greater and more urgent. Supplies of all sorts will be harder to get, while at the same time there will be more in need. The responsibilities for taking care of the country's defenders will increase, and thus grows the importance of every women in some way taking a hand.

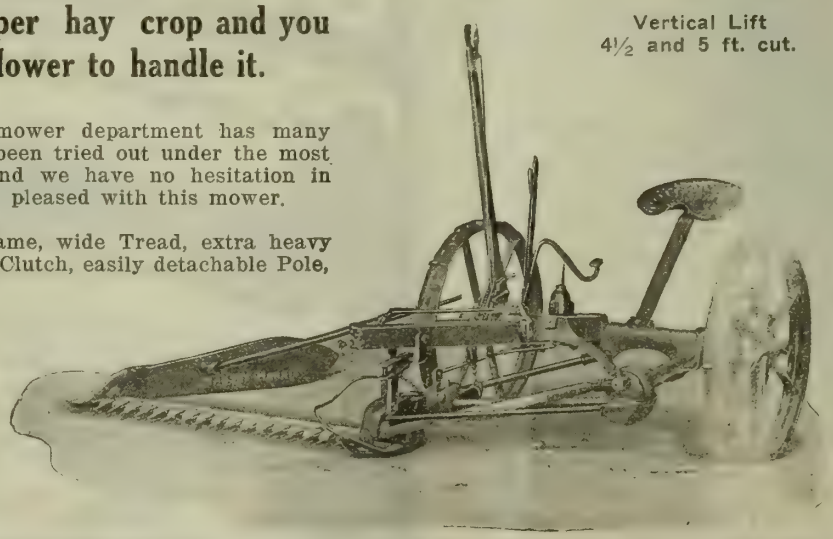
Here is a reliable Mower for cutting your hay

Prospects are for a bumper hay crop and you will need a reliable Mower to handle it.

This latest product of our mower department has many new features—all of which have been tried out under the most difficult and trying conditions, and we have no hesitation in saying that you will be more than pleased with this mower.

It has a strong one-piece Frame, wide Tread, extra heavy Push Bars, Improved Gearing and Clutch, easily detachable Pole, simple and easy Vertical Lift, Under Draft, Flexible Swath Board and many other features you must see to really appreciate.

Our nearest agent will be glad to show you.



MASSEY-HARRIS CO., LIMITED, Head Offices: TORONTO
Headquarters for Maritime Provinces—MONCTON, N. B.
AGENCIES EVERYWHERE

Children can knit and sew and make things useful. In fact, thousands or them are so engaged. But it is a question if more could not be accomplished. Up to date there has been little canvassing for helpful aid. Nearly all that has been undertaken has been voluntarily assumed. The time, it is to be feared, is coming when this will not be enough. In Britain already house-to-house canvassing is being conducted, and women are being asked if they cannot do one thing, to do another. The question is put to them plainly: What will you do to help in the defence of your country, in support of the men who are fighting to keep your homes and land from desecration and violation, for the liberty of nations, for the punishment of wilful, wholesale murderers, and for the honorable observance of sacred treaties? Answers are generally forthcoming in an agreement to supply each week or month some article or articles that will be useful. Information is afforded on the requirements and the rules of the service that is asked. In this way a great deal is accomplish d, women and girls employing many a spare minute that otherwise would be wasted.

Our women are doing much, but are they really doing all they can? As individuals, many of them doubtless are; but are they encouraging others to do likewise? In these days it is hardly enough to sit down and work one's self. Examples must be followed and must be forced along. There is not a woman or a child who cannot in some way help. Comprehensive organization is needed to utilize that way. We should one and all bear in mind that at such a time as the present the non-application or misapplication of effort is as much a sin as wasteful extravagance.

RECENT DATA RE POTASH FROM THE SEA

On the inside back cover of this issue of The Maritime Farmer will be found an article entitled "Potash from the Sea," by J. A. MacDonald, of Prince Edward Island, which will be of interest to many of our readers, particularly to those residing near the sea coast where kelp comes ashore.

Since the cover pages went to press we have received a communication from Mr. MacDonald which reads, in part, as follows:

"Recent data, just received, show that kelp is a much more valuable source of potash than I made it in the article recently sent you.

"Instead of 9 pounds of potash per ton, fresh material, it contains 31 pounds per ton, and therefore instead of being worth $4.50 it is worth $15.50 per ton for its potash alone.

"It is truly a valuable manure and our shore farmers have a mine of wealth at their doors, and are indeed quite independent of the Germans for potassic manure for their potatoes, legumes, etc.

"Following is the data to which I refer."

Central Experimental Farm
Ottawa, June 8, 1916.

John A. MacDonald, Esq.,
Prince Edward Island.

Dear Sir:—

In reply to your letter of the 30th ultimo, we wish to inform you that our analysis of Laminaria longicruris (which is probably similar or identical to the variety of kelp you mention) shows the following composition, calculated to the fresh material:

Water, 88.30 per cent; organic matter, 7.15; ash, 4.55; nitrogen, 0.251; phosphoric acid, 0.134; potash, 1.546; lime, 0.075.

The amounts of nitrogen, phosphoric acid, and potash per ton would be, respectively, 5, 2.7. and 31 pounds. When we consider that a ton of good barnyard manure, in which the liquid portion (containing half the nitrogen and three-fourths of the potash) has been carefully conserved, contains approximately 10 pounds of nitrogen, 5 pounds of phosphoric acid, and 10 pounds of potash, then by comparison with kelp the latter appears a much more valuable source of potash.

THE RAMBLES OF A CANADIAN NATURALIST

We have just received from J. M. Dent & Sons, Toronto, a copy of "Rambles of a Canadian Naturalist," by S. T. Wood. This author needs no introduction to the reading public of Canada. His articles in the Toronto Globe from time to time have made his name a household word. He has by his writings helped a great many young people, and the older people too, to read the open book of nature. His writings are always descriptiv , and he or she who fails to see the pictures he depicts is dense indeed.

He or she who reads "The Rambles of a Canadian Naturalist" will find it a valuable literary production. Mr. R. Holmes, the artsit who did the work for Mr. Wood's book, is an artist indeed. An international critic who was privileged to look over Mr. Holmes' collection, said he had never een such perfect reproductions of birds and flowers. The artist's as well as the author's work will delight the readers of "The Rambles of a Canadian Naturalist." Secure a copy for the boys and girls.

WORMS CAUSE UNTHRIFTINESS

When fowls seem persistently unthrifty, and do not respond to liberal feeding, it is a good plan to kill and examine one or two to see if worms may not be the cause. Oil or turpentine is said to be an excellent remedy for worms. Mix it in a soft mash, allowing about fifteen drops for each bird, and give it in the morning before other feed is given. Keep the birds shut up for two or three hours, and then feed another mash with which half a teaspoonful of Epsom salts is mixed. They can then be allowed to go free if desired. No harm will come from this dose even if there are not many worms present.

There is a great difference in the production of fruit trees. Prof. S. W. Fletcher kept the records for four years on 1245 apple trees. He found that 375 trees average four barrels each and produced 60 per cent of the crop. There were 215 trees which produced less than a barrel each and were a dead loss to the grower. Trees propagated from heavy producers should be worth more than those of unknown parentage.

THE BIOGRAPHY OF BOSSY

(Continued from page 601)

Mr. Bob was taking little Henrietta over to a neighbor-s house, by the short cut through the meadow, when he happened to catch sight of me snuggling up as close to the stone wall as I could get, my tongue hanging out, and my head dragging the bare ground.

He understood in a moment.

"Oh, Henny," he exclaimed to the little girl, "there's poor Boss out in all that hot sun! She'll die. I told that fool man to give her the run of the lot on days like this. Come on—we'll take her down to the creek."

He held his big straw hat over my head as he led me through the gate and along Bennet road to the lower lot—think of that—taking off his own hat for a cow! When we reached the little stream which goes gurgling through a wood of sweet, low-branched maples and dogwoods and sturdy oaks, he filled the old hat with water from the brook and poured it on my steaming head. I was happy that there should be, in all the world, so great and so tender and so godly a man as Mr. Bob.—Springfield News.

THE HORSE INDUSTRY

(Continued from page 605)

farmer has been directed almost exclusively to the sire. True, nothing but pure-breds of good conformation and quality should be used. The time has arrived, however, when in the best interests of the industry, and in order to achieve the greatest success in breeding, particular attention should be given to the breeding mare. The best should be carefully preserved for breeding purposes. The good results from the use of high-class stallions will be greatly minimized if the mares are poor specimens. Mares that are worn out, unsound, faulty in conformation, or affected with any hereditary unsoundness should not be used for breeding purposes. Further, better feeding, care, and management should be practiced in raising the colt. A high percentage fail to develop normally through lack of proper care and sufficient nourishment. Horses are made or marred by the usage they receive when coming to maturity. Careful mating coupled with good feeding and management will result in the production of a high percentage of marketable horses.

In passing, it might be noted that, despite all the educational work that has been done, and despite the various enactments that have been passed in aid of horse breeding, there still is to be found in the country a rather high percentage of horses that fail to pass the remount inspectors. "As you mate, so shall you breed;" or, in other words, if you mate sires and dams that are of poor conformation and unsound, you may be sure that a high percentage of the progeny will possess these undesirable characteristics.

Pure Breds

The breeders of pure breds are today at the parting of the ways. Heretofore the magic word "IMPORTED" has carried much weight. There is much good imported stock in the country. The question arises: Is it necessary to go on importing year by year and paying high prices for imported stock when the breeders, by giving attention to mating and to the feeding, care, and management, which is the other half of successful breeding, can produce a horse as good as, if not better, than a high percentage of the animals heretofore imported? The horsemen of Canada have an opportunity now such as never hitherto came their way. There are many good pure-bred mares in the country as well as good sires. Now is the time for the good horsemen who have the interests of the industry and of the country at heart to devote their attention as never before to the production of more and better horses. Let them not only mate carefully, but feed and develop the progeny, from birth to maturity, as do the breeders of the European countries. Let our importers prove title to their claim of being practical horsemen by breeding and developing high-class animals.

A Pure-bred Market

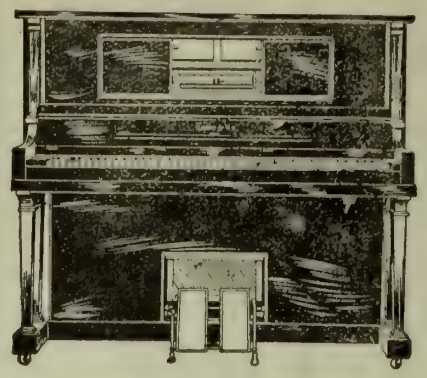
During the past year the Dominion Live Stock Branch has had official inquiry from Australia regarding our horse industry. It was pointed out that after the war Australia would be in the market for good Clydesdales with which to improve the horse stock of the country. Particular attention was drawn to the fact that only good stallions were wanted. The distance from Canada being much less than from Britain, it is felt that horses could be more conveniently obtained here.

Legislation Affecting Horse Breeding

During recent years much valuable educational work was done by the Breeders' Associations and the various farmers' organizations. Ultimately this work brought results. Today in every province except Quebec stallion owners are compelled by Act of Legislature to enroll their stallions with the local Agricultural Department before standing them for service, and to publish in all advertisements a copy of the Enrollment Certificate. It is now possible for all interested to learn from the stallion poster whether a particular stallion is a pure bred, a grade, or a scrub.

The provinces of Saskatchewan, Manitoba, Ontario, and Nova Scotia have gone a step further. In Saskatchewan any district may prevent the use of unsound horses, grades, and scrubs by a majority vote. In the Province of Monitoba only pure-bred stallions are allowed to stand for service. In the Province of Ontario all unsound grades and scrubs must be retired; and in 1918 only pure-bred stallions will be allowed to stand for breeding purposes. In Nova Scotia, as well as the three provinces above mentioned, all horses standing for service must be veterinary inspected, and all advertisements must give a copy of the license granted, which states, not only to what breed the horse belongs, but also whether he is sound or unsound.

By persistent effort and the gradual process of educating the people to the necessity of using better sires, and the profits to be derived therefrom, these useful and beneficial laws have been secured. It will be necessary for the other provinces to immediately enact similar legislation. Otherwise they will not only find themselves outdistanced, but they will also become market centres for the poorer animals. It would appear that a uniform Stallion Enrollment and Inspection Act for all provinces of the Dominion would be a still further step in aid of horse breeding.



At Last ! ! Here is a Small Ideal Player Piano for the Farm Home

What the Farm Home Needs---MUSIC

Here's just the instrument that you have been waiting for, neat, attractive, compact, and a convenient size. How many times have you wished that you could purchase an instrument that would not look too large for your home, that would harmonize with the furnishings and appearance of the room.

Just think of having a player-piano possessing all the requirements of a full-sized instrument but measuring only 4 feet 3 inches high.

This Sweet Toned Ennis Player Piano is a brand new model equipped with all the latest improvements and absolutely trouble-proof.

This beautiful player-piano will bring into your home new joy, love and life. You will never know the joy of being able to personally produce music until you have seated yourself at this responsive player and brought forth from those keys that you thought would be forever silent to you—Music—as the great musicians would play. Whether popular, sacred, opera or dance music your home can have all the music ever written.

Your children will appreciate this wonderful instrument because it will give to them the greatest joy in their life and assist to give them a musical education and create an ear for good music. Make no mistake about the value of this instrument—the price is well within your reach.

The Price is only $450! Small, indeed, when you consider the value and amusement it will be to your life and family. You'll be delighted when you see it. And when you experience the joy of producing music you'll know that it is the ideal instrument at a moderate price.

Simply tear off the coupon at right while you sit there reading this now, and fill in and mail for our descriptive booklet and easy payment plan. It will cost you nothing. No trouble, just sign and mail to-night.

TIMELY SPRING TOPICS DISCUSSED

(Continued from page 597)

it is necessary to fallow the less danger there will, therefore, be from fall frosts, providing of course the seeding takes place as early as it would were the lands fallowed.

Pasturing the Fallow

Any practice that lessens the moisture or available plant food content of the fallow will lessen the vigor of growth, but increase the earliness of next year's crop. Under certain conditions it pays to produce a less rank crop and get it mature than to have a heavy, late, unripened one.

Some men let the volunteer plants grow on the fallow and pasture them off. Others sow a thin crop of oats and pasture it off, while still others sow rape in cultivated rows and pasture it off. In each case the next year's crop is invariably earlier, although not necessarily as heavy.

Tillage of Fallow

Late plowing of the fallow, late breaking and shallow plowing of the fallow are practices directly opposite to those recommended for storing and conserving moisture. For the reason that these store less moisture, the soil is warmer, and earlier, though less rank, crops are the result.

Use of Intertilled Crops or Hay Crops

Wheat matures earlier after corn or roots or well firmed potato ground than on fallow, and in the north yields as well as the fallow.

All cereals ripen earlier on well prepared breaking, whether prairie or cultivated hay land, than on fallow, and in short seasons produce a more profitable though less heavy crop.

Use of Early Classes and Early Varieties of Grain

Barley ripens in fewer days than oats, and oats in fewer days than wheat.

In each class there are early varieties. The six rowed barleys are earlier than the two-rowed. The beardless and hulless earlier, though less valuable, except for forage, than the six-rowed.

Daubeney, Sixty-day, and similar varieties are our earliest but least productive oats. Gold Rain is the heaviest yielding medium early oat we have. Victory and Banner are later, but heavier yielders.

Prelude is a very early but low producing wheat. Pioneer is not so early, but a heavier producer. Marquis is later than either, but a heavier yielder. Red Fife is the latest of all, and equal in yield to Marquis.

Winter rye generally ripens before any of the other cereals, but is occasionally caught by late spring frosts when in the bloom.

Use of Frost Resistant Crops

The perennial grasses and legumes, such as western rye grass, brome grass, and alfalfa, resist frost more than any of the cereals. The root crops resist frost in the fall, but not so well in the spring. The cereals usually recover after spring frosts, but fall frosts work serious injury on them. Corn is resistant to frost neither in the spring nor fall.

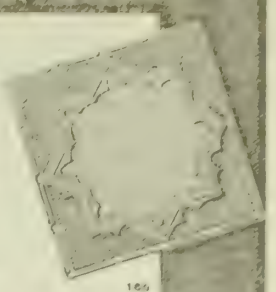
Where there is serious danger of frequent early fall frosts, as in the farthest north settlements, the more extensive use of forage crops or cereals used for forage purposes is advisable. This, of course, means mixed farming or live stock farming.—Nor'-West Farmer.

For fire-safety, inside the home use "Metallic" Ceiling Plates

YOU can make your home fireproof and more attractive at small cost by using Metallic Ceiling and Wall Plates. Many beautiful designs with cornices and mouldings for any style of room. You can put them on old walls as easily as new. Wash them or brighten up with paint whenever desired.

"Metallic" Ceiling Plates are sanitary, fireproof, inexpensive and good for a life time.

Write for booklet and prices. We manufacture all kinds of "Metallic" building materials and sell direct at lowest prices.



Metallic Roofing Co. Limited, Toronto and Winnipeg

HOW TO MAKE STARCH

This is the way to make plain boiled starch:

Allow two tablespoonfuls of starch to a gallon of water. Wet the starch with cold water until it is of the consistency of cream. Then pour over it the water, which is bubbling. Stir constantly until smooth, and boil for five minutes. Add an inch of candle—to a gallon—or a tablespoonful of lard to give a very smooth starch.

This is the foundation for all starching, excepting that done with uncooked starch.

If a very stiff starch is desired a tablespoonful of gum arabic water to a quart of starch gives good results.

To prepare gum arabic water, pour two cups of boiling water over a quarter of a pound of gum arabic. When the gum is dissolved, strain the solution into a bottle, cork, and keep on hand for use in the laundry.

Archbishop Ryan was visiting a small parish in a mining district one day for the purpose of administering confirmation, and asked one nervous little girl what matrimony was.

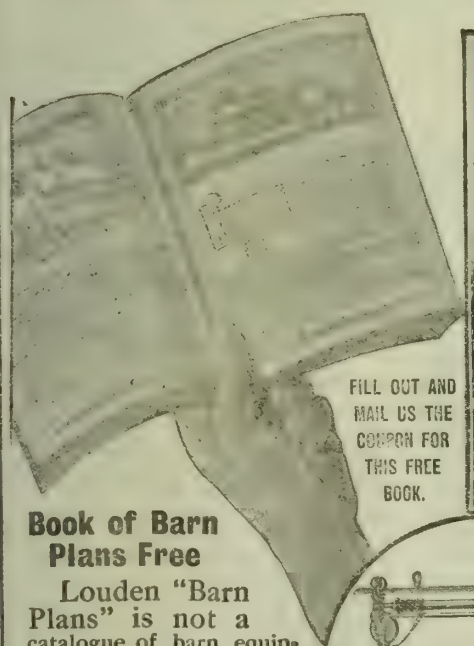
"It is a state of terrible torment, which those who enter are compelled to undergo for a time to prepare them for a brighter and better world," she said.

"No, no!" remonstrated her rector. "That isn't matrimony; that's the definition of purgatory."

"Leave her alone," said the archbishop; "maybe she is right. What do you and I know about it?"

LOUDEN BARN EQUIPMENT

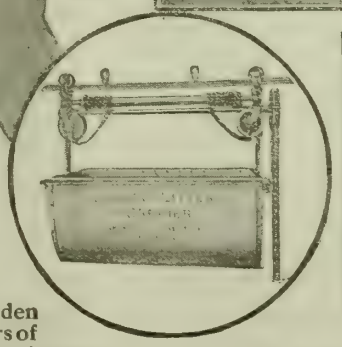
FOR QUALITY FOR SERVICE FOR SECURITY

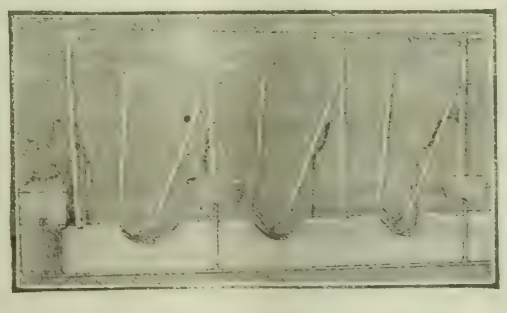


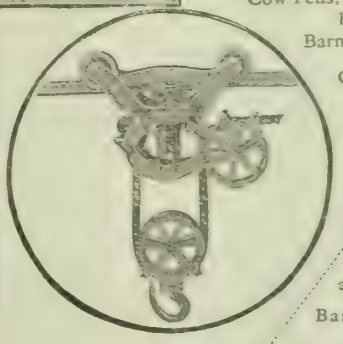
FILL OUT AND MAIL US THE COUPON FOR THIS FREE BOOK.

Book of Barn Plans Free

Louden "Barn Plans" is not a catalogue of barn equipment. It is a complete and valuable book of reference and instruction on barn construction. The 112 pages of Louden Barn plans is full of dollar saving information—the best of ideas gathered by the Louden Company during many years of barn building, and barn equipment experience. 51 representative designs for cow barns, horse barns, general purpose barns and hog houses. In addition, there are 32 pages devoted to general construction problems, such as concrete work, laying floors, roof construction, ventilation, etc.







Louden equipment makes possible a clean, sanitary barn with a minimum of expense for upkeep. When cows are transferred from dark, dirty barns to Louden barns, the milk flow often increases from 15 to 25 per cent. and the labour of caring for the herd is reduced from one-third to one-half.

The cost of of installing Louden equipment is surprisingly small, and is just as great an economy for the man with a half dozen animals as for a man with a hundred. The percentage of labour saved is the same.

The Louden Line includes:

Litter Carriers, Hay Carriers,
Feed Carriers, Cow Stalls,
Horse Stalls, Water Basins,
Cow Pens, Bull Pens,
Hog Pens,
Barn Door Hangers.

Catalogues Free

Please send me copy of Louden Barn Plans. I expect to build (or remodel) barn for .....cows and.....horses

Barn will be about x ft.

BUSINESS PRINCIPLES IN MARKETING FARM PRODUCTS

Having been both a farmer and an advertiser, and having made the combination a profitable one, the following suggestions are offered for what they are worth to those who are beginning to think of something more than makinb two blades of alfalfa grow where there was only one rag weed before, writes H. B. Trueman in the St. Paul Farmer.

Ever since Adam set the pace as a producer without a market, the farmer has been long on production and shy on salesmanship. He has become ossified, in a manner of speaking, in this attitude toward the old notion of being a tiller of the soil exclusively. He has had it dinged into him by all the powers that have tried to "uplift" him. The two-blaes-of-grass theory has been quoted by public speakers and writers ad nauseam. Especially the kind of gentlemen who generously relieve him of the care of shipping, transporting, commission merchanting, and otherwise standing—meaning, of course, the philanthropic middlemen—how they have striven to inoculate the farmer with this idea that he is a producer solely!

Now, brother farmers, I think I am well within the facts when I state that the only men who ever made a big thing of farming are the producers who were also their own middlemen. Not satisfied to close the deal at the grocery store, the elevator or the loading chutes by letting the other fellow fix the prices, they combined modern business methods with the new science of agriculture. By so doing they not only grow maximum crops, but get maximum prices for their output.

Conceding the truism that it does not pay to grow grain and hay for sale, it is evident that, if a man is farming for money instead of health, he might better feed the crude crops of the fields to live stock that will yield the highest returns. When a man has raised a bunch of choice pure breds he has got something to talk about. And that is all there is to advertising. The one who makes the most convincing talk is the one who gets the cream of the trade.

Advertising is telling the world who and where you are, and what you have for sale, and adding a dash of ginger that will make the reader want your article so much that he simply can't resist it.

Advertising is salesmanship on paper. Every sales goes through a certain routine. I mean a sale where the vendor comes out first best. It is not salesmanship when a farmer drives up to the elevator with a wagon box full of No. 1 hard, and yells "How much?" That's only filling an order if it is not absolute slavery. Scientific salesmanship is selling goods at a profit through persuasion. First you catch attention, then create interest, then induce desire, and finally persuade to the resolve to buy.

When a farmer with something special of high quality to sell can turn this trick his fortune is made. Hark, hark you! the great material prizes of the world go to the man who can persuade others to buy. A school teacher in the noblest and most responsible profession in the world gets $800 a year, while a traveling salesman with no education and less morals gets $5,000 because he can make more for the man who makes the goods.

The first thing for a farmer to do to get in this game is to produce something that people want. Next he must put it up in such attractive form that it will appeal to his customers. No use talking, folks will eat with their eyes. Offer a messy lump of butter, done up in a bit of rag; wear your overalls, and talk rough—you couldn't sell blue-ribbon butter at oleo prices. But put your A-1 butter in a clean carton holding a pound print, wrap it in a pretty, printed label, tell by type or voice how clean you keep your cows and dairy, how this butter took the first prize at the county fair, give the lady a taste on the end of a toothpick, and ask ten cents more a pound for it than she pays for oridnary creamery butter—and it's a ten-to-one shot that you will have to buy more cows before long.

A salesman or advertiser has got to put a big chunk of psychology into his work, which is no more nor less than understanding the human heart and telling the truth in an interesting way.

I am not trying here to write a complete compendium on scientific advertising, but only to hint at some of its possibilities. There isn't a farmer in the land, no matter how peculiarly situated, nor what manner of stuff he raises, but can improve his financial status by employing business system along with his scientific production.

The writer spent a goodly number of years as a dairyman near a large city. Wholesale returns being considered inadequate for his ideals of decent living, a wagon route was started and a sanitary bottling plant installed. We had choice milk. That was the foundation. No use advertising or boosting an article without superior merit. We told people about our specialty. Folks with babies and puny children, sick folks and old people, discriminating judges of good milk, and others were glad to pay us ten cents a quart for our bottled sunshine-and-clover, where our competitors were getting an average of six cents a quart.

Another time we had some superior oats. They were too good for feed, and we put a little advertisement in several papers read by farmers. Instead of selling on the open market juggled by those sacred "quotations," we got a dollar a bushel for our good seed. They were worth the money. The oats were heavy, plump, virile, free from weed seed, and carefully claned and graded. We shipped at buyer's expense for freight, but furnished the bags.

A neighbor had a fine crop of onions. He put up a unique sign at the front gate offering them for sale at retail prices, and folks came to his door, paid cash, took their purchases away, and were glad to get the extra fine article.

Another friend living near a lively factory town made money selling weanling pigs at five dollars apiece. Almost every family in the suburbs wanted a "swate bit of a pig" to bring up by hand in a pen, to eat table and garden scraps, and grow into a 300-pound porker for family use.

Another dairyman who made butter heard of Prof. Metchnikoff, successor of the great Pasteur, and his Bulgarian soured milk that makes you live to be a hundred. He procured some of the dope and learned how to make this new brand of "buttermilk." It sold at fancy prices at drug stores, hotels, and at private residences. What formerly had been fed to the hogs at a value of about a cent a gallon was converted by brains and skill into a highly desired article of human food, and brought from twenty to forty cents a gallon.

The parcel post and the corresponding low express rates offer opportunities to farmers living within 150 miles of a city to build up a profitable trade in certain products direct with the consumer. A favorite way in some localities is to hunt up by advertising or personal solicitation a set of good paying customers who think first of quality and second of price, and ship a weekly hamper of eggs, dressed poultry, butter, cottage cheese, fresh or cured meats, vegetables, fruit, flowers—in fact, anything a farmer uses on his table, and all packed according to the needs or whims of the customer.

The empty hamper—made of willow—comes back at slight cost.

There is no limit to the things a farmer's family can do in the way of producing something else besides corn, timothy hay, and fat stock for the "quotation" markets. It takes a little imagination and some nerve to get it started; it requires some brains and commercial ability to keep it going. The prospect for making the farm pay commensurate returns with industry and ability is an attractive one to the man or woman of ambition and enterprise.

But before attempting anything of this sort, the reader should get this everlastingly fixed in his mind:

QUALITY BEFORE QUANTITY.

FORGIVENESS OF NATURE

The Farm Lawn—How to Plant and Maintain It

A well-sodded lawn is the first attribute of pleasant surroundings for a farm home or any other home. Care and work and intelligent attention will insure a successful lawn in exactly the ame proportion that a farm crop can be grown on that farm or under similar conditions. The man who wants a farm home with comfortable and pleasant surroundings for his family instead of merely a place in which to exist will find that results amply repay the effort and expense in securing and maintaining a sodded area of grass surrounding his house. A well-kept lawn is a thing of beauty, is restful, and is useful.

Blue Grass Makes the Best Lawn

The manner of planning a lawn and the kind of grass to be used must be determined by conditions and the section of the country. Blue grass is by all odds the greatest lawn grass in America. In all the states north of the latitude of central Tennessee, with the possible exception of some parts

For heavy tangled fields trust your

Frost & Wood Binder

Many binders will cut grain that is standing nice and clean but for tangled, heavy, rough-and-tumble cutting you certainly need the strength and light draft of the Frost & Wood Binder.

Bear in mind that the crop you lose through bad cutting may well represent your net profit. Most of the crop goes to pay expenses—it's the last few bushels that represent your PROFIT. You can't afford to lose a head of grain.

The Frost & Wood Binder is built of the toughest, strongest, yet lightest materials that money can buy. We use wonderful, dust-proof, roller-bearings at every friction point, which makes long life and easy work. The elevtion is worked out on new lines, it can handle any crop, no matter how choked or heavy.

Handy levers work the reel to any position and bring the grain to the cutters no matter how tangled or short it is. The Frost & Wood Knotter is very simple, and get-at-able. Needs no adjusting and it won't fail you.

The sheaf compressor and ejector is worked by a smooth-running eccentric sprocket that does its work without jerking or strain. Hardly know it is at work—easy on the binder and the horses!

Big power wheel, strong bracing, improved cutter bar construction and many other good features. You ought to have our new catalogue at once and make a careful study of the Frost & Wood Binder. Don't take chances with your crop. See our nearest dealer at once or write us today for catalogues.

THE FROST & WOOD CO., LIMITED

MONTREAL, SMITH'S FALLS, ST. JOHN

There is more or less work

Every furnace demands *some* attention. But there is no reason why the twice-a-day job should be anything but pleasant. And to save *little* time and a little bother every day means a lot in the course of the winter.

The Sunshine is a Furnace any one can look after without spoiling either clothes or temper

The door is large enough for the biggest coal shovel. The grates are strong and turn easily. The ash-pan catches all the ashes without the need of shovelling. The water-pan is located so that it can be filled quickly.

Ash-dust cannot escape when the Sunshine is being shaken down. None of that light dust floats about the house or the basement.

The damper and the check draft can be regulated from upstairs—and perfectly, too. The close-fitting doors and dampers hold the fire for hours without waste.

McClary's Sunshine Furnace

Do you know how little it will cost you to enjoy the comforts of a fine Heating System in your home? Send the coupon for a copy of our booklet "Sunshine." And if you wish to have prices of installing a Sunshine Furnace, let our Heating Engineer send you the information. Tell him the kind of a house you have and the number of rooms; give him a rough ground plan of the upstairs and downstairs, and he will show you how to plan your heat distribution so as to get the utmost out of it. There is no charge for the service; it is free whether you buy a Sunshine Furnace or not.

Kindly send me without expense on my part:—

1. Your booklet on the Sunshine Furnace.

2. Also forms for filling out, so that your heating engineers can tell me how to order and install a system that will properly heat my home.

of the extreme northern tier, blue grass is the king of lawn grasses. In the extreme south Bermuda grass is best. White clover is the most popular plant to sow with blue grass, and the two make an ideal combination. Next to blue grass probably come the Rhode Island bent grass and red top. The ideal lawn soil is moderately moist and contains considerable clay. This does not mean that a lawn cannot be made on loose, sandy soil, but it will take more work and expense. Sometimes it is practicable to place 3 or 4 inches of clay on top of light, sandy soil, and then mix the two to a depth of about 6 inches in preparing the seed bed for a lawn. Remember, that since a lawn is to be a thing of permanency, and also because the area involved is small, it justifies an unusual outlay both of labor and money in case special treatment is needed.

The best landscape effect is obtained from a convex surface, that is, a sloping or slightly rolling lawn is to be preferred. Plant your trees and shrubbery so as to give the effect of big, open spaces. If your soil is clay or sand loam on a clay subsoil you have the ideal foundation. This will give you fertility and is retentive of moisture. Don't, of course, make the mistake of trying to plant a lawn on wet land. You want the plot well drained, but the nature of the soil retentive.

Put a lot of work on soil preparation. The actual seed bed need not be over an inch deep, but there should be 8 to 10 inches of good rich soil underneath. This should have been spaded up or plowed, worked up carefully, fertilized, and packed. Remember that your lawn may be there for many years, and that the grass must have a big area of fertility from which to draw if it is to last. There is no danger of making your lawn soil too rich. Plow it up 8 or 10 inches deep, work is over carefully, and put on well-rotted manure at the rate of 50 to 60 loads to the acre, working this in thoroughly. Put on 1000 pounds or more ground limestone to the acre, and 500 pounds or more finely ground bone meal. Just before seeding work in high-grade fertilizer at the rate of 300 to 500 pound to the acre. Have this consist of about 3 per cent nitrogen, 8 per cent potash, and 8 per cent phosphoric acid.

Before putting on the complete fertilizer cultivate the soil for quite a while. Go over it frequently, break it up, and kill all the weeds that appear. Cultivate it, roll it, and then rake it so as to form the seed bed on the surface.

Experience is divided as to spring or fall for sowing blue grass and white clover. Spring sowing, generally speaking, is to be commended where it can be sown early enough that it will get a good start before the days become extremely hot. Blue grass germinates at comparatively low temperature and the hot sun is hard on the young plants. If you don't get it seeded in the spring, cultivate the ground all summer and sow in early September. Some means for sprinkling the ground and keeping sprouting seed well moistened should be provided. Seed sown just before a gentle shower often gives splendid results.

Sow Plenty of Good Seed

Sow blue grass alone at the rate of two bushels an acre. Most people want some white clover in the lawn, however, and in case you use this put in a peck of white clover seed and one bushel three pecks of blue grass, or use it in the proportion of that amount per acre. Remember that these seeds are very small, and that they must be in close contact with the soil particles in order to sprout well. Therefore have your seed bed fine and moist.

Of equal, or perhaps greater, importance than soil preparation is seed selection. The best seed is none too good for your lawn. Be sure that it is pure—that is, not mixed with other varieties, and free of weed seed. If you have any doubt, send a sample to your experiment station and doubtless they will test it for you. You had better pay the price for cleaned blue grass. This high-grade product weighs 22 pounds to the bushel, while the average seed weighs nearer 12. Better sow too much seed than too little.

Use the Roller and Lawn Mower

Clip the grass when it is 3 inches high. Usually on a new lawn it will pay to use a roller before this first clipping or immediately after. This eliminates irregularities of surface which it will be almost impossible to do after the grass becomes thoroughly established. The roller is a very essential implement in making and main-

Our winnings at the Maritime Winter Fair against strong Competion were as follows 1st cock 1st hen 1st cockerel 1st 3rd pullet, 2nd utility Cockerels 1st & 2nd utility pullets and 1st pen.

Our breeding pens are mated as follows

PEN NO. 1 Headed by "General Joffer" 1st cockerel at Halifax, F'ton, and Amherst mated with the 1st pen at the same shows, with 5 others of equal merit. Eggs $3.00 per 15

PEN NO. 2 Headed by "Kitchener" 1st Cock at Halifax, F'ton, and Amherst mated to the 1st 2nd Pullets with six others just as good. Eggs $2 00 per 15.

PEN NO. 3 Headed by "Prince" never shown, but an exceptionly fine utility bird good eye, color right through with lots of size mated with the 1st & 2nd pairs of utility pullets at Amherst 1915 with others that will produce stock that will fill your egg basket next winter Eggs $1.50 per 15

All infertle eggs replaced free of charge

R. R. BLACK, "Elmhurst Farm," Oxford Junct., N.S.

R. O.M. and R. O. P. Holsteins

Would you like to get a good foundation? Holsteins of this calibre are seldom offered at any price, but we are overstocked and will offer::—

2 Daughters of "Ruby Nig" whose 7 day record is 567 lbs. milk, 25.60 lbs. butter; yearly record, 16,555 lbs. milk, 750 lbs. butter; the second highest record in Canada at 3 years of age.

2 Daughters of "Black Rose Beauty" whose record is 522 lbs. milk, 24.60 lbs butter in 7 days.

2 Daughters of Miss Rooker Posch, whose record is 402 lbs. milk, 16.114 lbs. butter in 7 days; 12,268 lbs. milk, 600 lbs. butter in one year, when 3 years old.

2 Daughters of Beauty Rooker, whose record at 2 years of age is 322 lbs. milk, 15½ lbs. butter in 7 days; 11,248 lbs. milk, 517 lbs. butter in one year.

And several others of equal breeding, sired by or bred to "Ida Rooker 2nds Vale," a sperior animal in every way and a proven producer of rich milkers. Also some extra nice bulls of the above breeding, all at reasonable prices.

LEA & CLARK, Victoria, P. E.

ELMHURST SHORTHORN STOCK FARM

Present Offerings—Six exceptionally good red and roan bulls, 10 to 18 months of age, from superior milking dams. Write me for prices and particulars before placing your orders elsewhere

BULL'S CREEK FARM

R. O. M. HOLSTEINS

All Bull and Heifer Calves advertised in previous issues sold. Present offering three good R O M. Cows now milking. If desired will be bred to my herd sire, (son of Woodcrest Sir Clyde the $2000 Bull.) Also a Yearling Heifer already bred

J. H. STOCKTON, BULL'S CREEK FARM, —WOODSTOCK. N. B.

HOW TO PRODUCE CREAM THAT MAKES GOOD BUTTER

(Continued from page 593)

makes difficult accurate sampling and testing. It is undesirable, further, because it diminishes the amount of skim milk available for the feeding of calves and pigs; in increases the cost of transportation for every pound of butter fat shipped; it makes impracticable the use of a reasonable amount of starter in the creamery, and starter is essential for the production of the best quality of butter; it does not churn out exhaustively and yields an excessive amount of buttermilk, augmenting the loss of fat, and thereby reducing the churn yield.

There are no advantages in producing a cream testing higher than 45 per cent. Too rich cream is undesirable because it tends to clog the separator; it increases the loss in handling due to sticking to the receptacles; it makes difficult accurate sampling, and thereby tends to yield incorrect tests.

It is desirable to produce somewhat rich cream in summer than in winter to prevent excessive souring in summer and difficult handling in winter.

Protection of Cream in Transit

The cream should be kept in the cooling tank until it leaves the farm. While being hauled on the wagon and waiting for the train at the station, it should be properly protected against heat in summer and cold in winter. This can be done by using a covered wagon for hauling, or by hauling the cream in insulated cans, or by slipping a jacket over the cans, or by covering the cans with a wet blanket in summer and a dry blanket in winter.

If the cans arrive at the station long before train time, as is often the case, a cooling tank filled with water and located in the shade, should be provided so that the cream is reasonably protected against the hot summer weather.

Sour Cream Tests No Higher Than Sweet Cream

The impression among many cream producers appears to be that sour cream contains more butter fat and yields a higher test than sweet cream. For this reason some farmers purposely keep their cream until it sours, and often store it in a warm place to hasten the souring. This impression is entirely erroneous. The acidity or sweetness of cream has no effect on its fat content, nor on the resulting test.

On the other hand, this practice of causing the cream to become extremely sour spoils its chances to make good butter and renders difficult the taking of a representative sample, and thereby lessens the reliability of the test, for the accuracy of the test depends above all things on the accuracy of the sample.

Reputation and Financial Returns

Every cream producer should take pride in delivering cream of the proper richness, that is smooth and uniform in body, sweet or only slightly sour, and that has a good clean taste. This is possible without unreasonable labor or expense; it can be accomplished on every dairy farm by properly adjusting the cream screw, thoroughly washing the separator after each separation, cooling the cream promptly, and keeping it cool by setting the cans in cold water, keeping the warm cream in a separate can until it is cooled, and by making from two to three deliveries every week.

As long as our creameries receive inferior cream they are unable to secure top prices for their butter, and can pay only second grade prices for butter fat. Good cream will enable them to build up a reputation for good butter, which means increased demand, higher prices, and larger returns to the cream producer.—Bulletin by O. F. Hunziker and G. L. Ogle, Purdue University, Lafayette, Ind.

What You Want.

Eggs for hatching and day old chicks from Bred to lay Stock. Barred Plymouth Rocks, S. C. Rhode Island Reds, and White Wyandottes. Prices reasonable. Booking orders now for Chester White Pigs. One Yearling Holstein Bull of good breeding. Could spare also a few females.

Maple Green Farm Holsteins

To avoid inbreeding, we now offer for sale our senior herd bull "Maple Grove Mercena Mercedes," coming 5 years old; weight about 2500 lbs., active, sure and exceptionally kind. His first daughter to be officially tested made 15.46 lbs. butter in 7 days at 1 year and 11 mos.; another at 2 years and 2 mos. was making nearly 3 lbs butter per day when she met with an accident and we had to drop testing her. His dam gave 12664 lbs. milk and 568 lbs. butter at 2 yrs. old in the R.O.P., and her sister Posch Mercedes Springbank 2nd, is the Canadian Champion 4 yr. old in the R.O.P. with 22000 lbs. milk and over 800 lbs. butter in the year. We are also offering Bull and Heifer Calves sired by him and "King Lyons Colantha" and out of high-class Record of Merit and Record of Performance Dams.

For further particulars write

FORGIVENESS OF NATURE

(Continued from page 619)

taining good sod. The old English saying that a good turf is secured by sowing seed and then rolling the land every year thereafter for 300 years contains a good deal of true philosophy. Keep the dandelions cut out, and never let the lawn grass grow seed.

Top dress the lawn at the beginning of each winter with well-rotted manure. The winter's snows will take the fertility down to the grass roots, and the coating will protect the grass from winter killing and blowing. Early in the spring rake off what is left, and then use the roller again, this time to settle the grass roots that may have been dislodged by heaving in the freezing and thawing of the soil.

INFLUENCE OF HEATING MILK ON THE NATURAL SEPARATION OF CREAM

Five different series of experiments were carried out to determine the influence of heating milk on the rapidity of the natural separation of cream from milk. The results of these experiments are collected in several tables, and may be summarized as follows:

1. Of the changes produced in milk on heating to temperatures below boiling point, those which exert an influence on the separation of the cream demand particular attention since they show considerable and easily measured variations for small differences of temperature.

2. These variations may be observed already at temperatures much below the coagulating point of the protein; for instance, heating for 30 minutes at 55 degrees C., and may result in an acceleration or retardation of the separation of the cream, according to the particular temperature.

3. Acceleration is distinct at 55 degrees V. and increases with the temperature to a maximum of about 61 degrees C., after which is diminishes, and between 63 and 64 degrees C., and probably a little below the latter temperature, it changes rapidly, and a retardation begins. This temperature can therefore be regarded as the critical temperature for the action of heat on the separation of cream. Heating to 65 degrees for 30 minutes causes a very remarkable retardation in the separation of cream compared with that of raw milk.

The writer points out the desirability from both a practical and theoretical standpoint of an extension of the researches, in view of the extreme sensitiveness to heat of certain constituents of the milk, so as to obtain information for estimating at their just value the changes produced in milk by any heating process.

By means of a more complete knowledge of this critical temperature it will perhaps be possible to find before long a definite solution on scientific grounds of the question of the best temperature for pasteurization. Certainly the determination of the rapidity of the natural separation of cream combined with the bacteriological analysis of heated milk will be of the greatest value in examining the various processes for the pasteurization of milk.

DISKING IMPORTANT PART OF SPRING PREPARATION

In the management of land for spring plowing, disking plays a most important part. When land has stubble on it, disking breaks up the stubble into small pieces so that when it is plowed under a more uniform distribution of the organic matter is assured and the danger of retarding the upward movement of water is greatly reduced. Furthermore, the stubble or organic matter will decompose much more rapidly.

When manure has been applied to the soil in the nature of a surface dressing, disking will incorporate it much more evenly in the soil, and reduce the harmful effects of excessive fermentation which is closely associated with incorporation in the form of layers, as is the common occurrence when the manure is simply plowed under. Disking also prevents drying out of the soil as the capillary water will have free access to the surface layer.

Soil that is dry, if disked before plowing, will make a much better seed bed, as clots will be less liable to form and the seed bed will be more mellow, more compact, and the surface would be less subject to excessive evaporation.

When spring plowing is delayed, disking the soil in the early spring prevents excessive evaporation as the operation mulches the soil. Should rain come during the early spring time, the disked soil will be in good condition to absorb the moisture.

Root crops that are to be planted on spring-plowed land will do much better if the land has been disked previous to plowing, as a more friable condition of the seed bed is obtained, the moisture content may be greater, and a greater amount of available food material may be present.

TILE DRAIN CHEAPER THAN OPEN DRAIN

Many farmers are laboring under the mistaken notion that a closed drain is much more expensive than an open drain, and are therefore wasting money in the construction of many small open drains. The fact of the matter is that in the majority of cases, especially where tile less than one foot in diameter is required, the closed drain is the cheaper. The slope of the banks of an open drain should not be less than 1 to 1, and the drain should in most cases, for irrigated lands, be at least 4½ or 5 feet deep. Figuring an open drain of this size and comparing the cost of the same with a ten inch tile drain, we find that they are just about equal.

The cost of the construction, however, is not the only thing to be taken into consideration, but the maintenance of the system is also of great importance. In the case of the open drain we have conditions exactly right for the rank growth of vegetation, and the open drain continually needs attention. The cost of maintenance therefore is high. The closed tile drain, on the other hand, if properly installed, requires very little attention as far as maintenance is concerned, and in the end is cheaper than the open drain.

Open drains have their place, and serve their purpose well when properly used, but they should be constructed for outlets of larger drain systems where tile would be out of the question on account of the large size necessary. They are, however, entirely out of place when constructed as lateral drains for individual farms.

THE "WESTERN-NATIONAL"

THE "NATIONAL-ATLANTIC"

CANADIAN GOVERNMENT RAILWAYS EXPRESS TRAINS

Quebec and Winnipeg.

A New and Vast Portion of Canada in the Making to be Seen While Travelling in Modern Railway Comfort.

A new chapter in the railway history of Canada, and in fact of North America, will be written with the inauguration of the new express service between Quebec and Winnipeg by the Canadian Government Railways.

More fitting names could hardly have been selected for the two expresses—the "Western-National" and the "National-Atlantic." The mere mention of such a service in normal times would have attracted "national" attention—for the opening of a direct railway route with a through sleeping car service, a route independent of junction or terminal changes, under Government ownership and management, and making a new link between the Atlantic and the Pacific, is surely of "national" import.

Commencing June 13th, the "Western-National" will leave Quebec at 2.00 p.m. Tuesday, Thursday, Saturday, arrive Cochrane, Ont., 4.10 p.m. Wednesday, Friday, Sunday, there connecting with the "National" from Toronto, and arrive Winnipeg 4.30 p.m. Thursday, Saturday and Monday. On the eastern trip the through sleeping car will leave Winnipeg 5.15 p.m. Sunday, Tuesday, Thursday, arrive Cochrane 6.55 p.m. Monday, Wednesday, Friday, and the "National-Atlantic" will leave Cochrane 7.15 p.m. Monday, Wednesday, Friday, arriving Quebec 9.10 p.m. Tuesday, Thursday, Saturday. This is 49 hours of travel, and the quickest time between the two cities. Observation sleeping cars will be operated, thus giving an opportunity of seeing a new portion of Canada in the making while travelling in moder railway comfort

The "National" traveller will note the hardy pioneer has not only blazed the trail, but has commenced settlement, for here and there along this—the most northerly of the eight Transcontinental routes—are already flourishing farming areas. He will see development in the lumber and pulp industry, and the vast possibilities for extension in those directions. He will stop at La Tuque (population over 4,000) and Cochrane (population over 2,000), modern towns, with schools, churches, hospital, electric light, built on lands which only a few years ago were in the heart of an unknown wilderness. Other towns in the making and town sites will be observed. He will cross noble rivers and ride in view of immense inland waters. The opening of such a territory will naturally suggest untold possibilities for the prospector, hunter, trapper, and angler—and these possibilities are so varied and extensive as to be beyond human calculation. Already there are competent guides who make it a business to conduct hunting and fishing parties to selected camps, while organized canoe trips on the network of rivers, and even to the shores of Hudson Bay, can be arranged. Evidences of the great world war will be seen in the Detention Camps at Spirit Lake and Kapuskasing, where foreign aliens are interned. The "National" traveller will pass through the Great Clay Belt for over 400 miles, an area of 16,000,000 acres of level or undulating land destined to be the future home of thousands of settlers. He will cross New Ontario, 330,000 square miles, fully four times the size of Old Ontario, into Manitoba, and reach Winnipeg over a section of the great wheat area of that fertile province. And all the time he will be on a railway on which no expense has been spared in making it what modern engineering science demands in an up-to-date railway.

Mention has been made that the railway from Quebec to Winnipeg is a link between the Atlantic and the Pacific. The Government Railways (The Intercolonial) from the Atlantic seaports, Halifax, Sydney, St. John, connect at Quebec from Levis by the car ferry S.S. "Leonard" until such time as the Quebec Bridge is completed. At Winnipeg the Grand Trunk Pacific, using the same Union Station, permits of direct connection with its lines for the Northwest and Prince Rupert on the Pacific coast, thus forming new transcontinental route from coast to coast—a route that will be the potential transportation factor in the development of Canada's new and vast areas.

Volume 21. SUSSEX, NEW BRUNSWICK, JULY 11, 1916. Number 19.

Control Potato Diseases by Practical Science.

To secure the best results in potato growing, the farmer is up against a fight of no mean order. He has to handle a variety of farm plant that is so highly civilized by the association and requirements of humanity that it is totally unfit to fight for itself in the race struggle. The "survival of the fittest" is apparently the law in nature, irrespective of the needs of the human family, and the potato in its natural habitat, revelled in a climate and atmosphere where its civilized enemies could not exist. Bearing these facts in mind, the farmer who wishes to succeed in growing the abundant crop must cultivate a sort of social interest in the plant and its surroundings, entrenching himself in all the known methods of war, scientific and otherwise, that up to the present is known to disease resisting militarism.

There are areas in Canada where potato diseases and pests are unknown, where the production is simply a process of planting and digging; but in some sections if such a step was taken potatoes would quickly retreat from the rural industry of these provinces. In order that it may be kept in a trained condition for the fight, the potato vine must be kept intact and in healthy condition from the first day it rears its head from between the clods of earth till the day that it fades in a ripened green old age in the early fall. Not only has the farmer to fight against the enemies of his own potato plot or field, but he has to contend with the plot of his careless neighbor, whose tactics of war are in favor of the enemy—a sort of anti-potato ammunition depot and factory, a neutral base where bugs, blights, and all the hosts of potato destruction are propagated and bred.

Keep Vines Green

It is of the utmost importance to the crop that the vines and foliage be kept green and growing even till late in September. The keeping of the potato tops green for such a lengthened period is not fully realized by the average farmer as of much importance in the ultimate success of the crop. No more striking proof is afforded of the importance of keeping the potato tops green and the plants growing well into the month of September than the results obtained by Prof. L. R. Jones, of the Vermont Agricultural Experiment Station, by digging potatoes at different dates and estimating the yield per acre. It is a simple experiment, and one which every farmer should try for himself. The following table shows the results:

Date of Digging	Total Yield per Acre. Bushels.	Field of marketable size. Bushels.	Average size of Tubers. Ounces.
August 2	58	30	1.6
August 12	115	75	2
August 22	230	163	3.7
September 1	304	234	4.4
September 12	356	303	5.2
September 22	379	353	5.7

From the above we find that 119 bushels of marketable potatoes developed during the month of September. In the Maritime Provinces many fields of potatoes are dry and brown by September, either through lack of cultivation or from disease. Not only is the yield of potatoes much increased by keeping the vines green well into September, but the quality of the potatoes is much improved. In previous articles it has been shown how a vigorous growth can be maintained in the early part of the season by cultivation, and now we wish to discuss how the tops may be kept green during the latter part of the season by a warfare on insects and diseases.

The first fellow to make its appearance on active duty is the Colorado Beetle. It is an insect so well known that its description here is unnecessary. Those that are hatched late in the fall hibernate during winter and emerge in the spring time on the outlook for potato tops. Their desire to find a potato plant is not so much for food to themselves, but for a nursery for their youngsters. The old bugs do not do much harm to the foliage themselves, but they lay their yellow clusters of eggs on the under side of the leaves, and in about a week the young larvae appear, and it is at this stage that destructive damage is done to the crop. Fortunately there are good remedies for this pest in paris green and arsenate of lead, but if the farmer waits till the foliage is well eaten before he commences spraying, his crop results will be poor. The longer the spraying is delayed the poorer the crop results will be. Unfortunately on perhaps the majority of farms nothing is done to destroy the potato beetles until the foliage is noticed partly eaten. Potato growers should not wait until the vines are injured, but should anticipate the arrival of larvae from the eggs of the mother bug, and apply a good insecticide.

What to Use

It is important to have a quick death-dealing article, and also one that will adhere to the foliage. Paris green and arsenate of lead are two of the best poisons to use. Arsenate of lead in the proportion of two to three pounds to forty gallons of water adheres better to the foliage than paris green and is a good poison to use. It does not appear to kill so quickly as paris green and a mixture is suggested of 8 ounces paris green and 1½ pounds of arsenate of lead to forty gallons of water, make the mixture into a paste, and there will not be so much waste by precipitation to the bottom of the barrel, and the mixture will mix better with the water.

Over the question of wet or dry applications of the insecticides there is not a concensus of opinion. The dry mixture should be applied when the vines are wet, so that it will adhere. If paris green is to be applied dry it should be done by mixing 1 pound of green to 50 pounds of slacked lime or any dry powder. If the dry mixture is put on when the foliage is wet it will adhere better than the wet mixture, and will also be more evenly distributed. If the beetle has started operations, do not wait for the favorable moist day to give the dry dressing, but start right away with the wet dressing, which can be done almost any day that outdoor work can be undertaken.

Whatever be the method chosen, spraying must be done thoroughly. All plants and all parts thereof must be well covered. A plant with one half sprayed and the other half missed will have the unsprayed part eaten off by beetles very quickly. This will leave enough beetles to continue the pest. One spray thoroughly well done is better than several carelessly applied.

How Blight Appears

Other diseases which follow in the wake of the potato bugs are blights of which there are two varieties, known as Early Blight and Late Blight. Early Blight does not cause the rotting of tubers like Late Blight, its destructive influence being seen in the lessened yield and checked vigor of the crop. This disease appears in round spots, irregularly placed over the leaves. They usually begin to appear early in July. The disease spreads by means of spores which permeate the tissues of the plant and can be carried over the winter by the dead stalks. It is almost impossible to do anything as a remedy after it has started, but the application of Bordeaux mixture in time acts as a preventative, and the foliage ought to be kept covered with Bordeaux mixture from the middle of July till the end of the season. It is a good plan to burn all stems after digging.

Although a good deal of harm is done to the potato crop by the Early Blight, it does not nearly compare with the ravages done by the Late Blight. During the month of July or early in August this disease appears on the under sides of the leaves with a hoar frost like appearance. It makes rapid progress, soon covering the field with large patches of brown decaying foliage. The strong, disagreeable odor from a potato field affected with this disease is familiar to all, and at this stage the crop will be benefited by a spraying of Bordeaux mixture.

There are only a very few Canadian farmers who spray for the prevention of Late Blight, and the loss sustained by this inconsideration is very great. At the Central Experimental Farm, Ottawa, this disease has received much attention, because of the importance of the potato crop in Canada. Some years ago circulars were sent out to all the leading newspapers, giving the results of their experiments at the Central Farm, with instructions as to the life history of the disease, the damage it did, and how to prevent it. Yet today we have to report that few, if any, farmers make any special effort to stamp out the disease from Canada. In the following table will be found the results of spraying with Bordeaux mixture as a preventative in the years 1901, 1902, 1904. In 1903 the potato plants were uneven through protracted drought, and the results were made of no value.

1901—Average yield per acre of marketable potatoes, sprayed 4 times: Sprayed, 333 bushels; unsprayed, 233 bushels. Average increase in marketable potatoes per acre by spraying, 100 bushels.

1902—Average yield per acre of marketable potatoes, sprayed 4 times: Sprayed, 310 bushels; unsprayed, 189 bushels. Average increase in marketable potatoes per acre by spraying, 120 bushels.

1904—Yield of marketable potatoes, sprayed 5 times: Sprayed, 369 bushels; unsprayed, 306 bushels. Average increase in marketable potatoes per acre by spraying, 62 bushels.

Average yield per acre of marketable potatoes, 3 years sprayed and 3 years unsprayed: Sprayed, 337 bushels; unsprayed, 243 bushels. Average increase in marketable potatoes per acre by spraying, 94 bushels.

These figures speak for themselves and it is unnecessary to enforce further arguments pointing out the necessity of more active operations on the farm field in the prevention of this disease. For Early and Late Blight the formula recommended is:

Copper sulphate (bluestone), 6 lbs.
Unslacked lime, 4 lbs.
Water, 40 gallons (1 barrel).

Dissolve the copper sulphate by suspending it in a barrel containing four or five gallons of water. It will dissolve quicker in warm water than in could. Slake the lime in another vessel and strain it through a coarse bag or fine sieve. Then half fill the barrel with water which contains the copper sulphate, then add the slaked lime, and fill the barrel to the content of 40 gallons. A stock solution of copper sulphate and lime wash may be prepared

Cabbage Root Maggot and Its Control in Canada

(Phorbiabrassicae Bouehe)

By Arthur Gibson, Chief Assistant Entomologist, and R. C. Treherne, Field Officer.

(Continued from last issue)

Habits

Food Plants.—The Cabbage Root Maggot, practically speaking, confines its attacks to plants of the Mustard Family or Cruciferae, such as cabbage, cauliflower, radish, turnip, and rape. In addition, however, to these crops the insect is recorded by Chittenden as being injurious to celery; and Slingerland records the feeding of the larvae on the roots of Common Winter Cress (Barbarea vulgaris) and Hedge Mustard (Sisymbrium officinale), both of which are wild plants belonging to the Cruciferae, or Mustard family. Lintner records the larvae as mining in the leaves of beets.

In addition to the above we have one new food plant to record and also to confirm Lintner's observation of the maggot attacking the beet. The injury to beets, however, was not to the leaves, as already recorded, but the maggot was found working in the roots. In 1910, when there was a serious outbreak of the Cabbage Root Maggot in British Columbia, Mr. Tom Wilson, an officer of the Branch, sent to us at Ottawa larvae which were found by him working in beans in that province, and from these we reared adults which emerged between the period July 12 and July 28. On June 16 of the same year we also received from Mr. Wilson roots of beet which he gathered near Duncan, B. C., and which were heavily infested by the maggot. From this latter material we reared adult flies in June and July. The flies from the beans and also those from beet were recently determined by Dr. J. M. Aldrich as Phorbia brassicae Bouche. The occurrence of the Cabbage Root Maggot in beans and beets is most interesting, but as these are the only instances known to us of this maggot attacking these crops in Canada, it would seem that this feeding habit of the maggot is unusual.

Nature of Injuries

The only stage in the life history of the insect which is injurious to plants is the larval or maggot stage. Injury by the Cabbage Root Maggot is largely confined to the roots of the plants it attacks, although occasionally the maggot will bore into the stem above the ground and also into the mid ribs or fleshy leaf stalks of such plants as cabbages and cauliflowers, and it has even been recorded as mining in the leaves of beets. In mid summer we have also observed at Ottawa, Ont., conspicuous injury by the larvae in the stems of the heads of cauliflowers. On July 22, 1912, many of the maggots were removed from a head and a photograph taken. From our observation it would seem that only the heads of those plants which had been attacked at the roots, as a result of which a withering of the leaves had taken place, were injured in such manner.

When the eggs of the insect hatch the young maggots immediately seek the roots, enter them, and soon reduce the tissues to such an injurious extent that the leaves of the plants wilt, become discolored, and eventually fall down. Such injury, of course, depends entirely upon the number of maggots working in the single root. Under favorable coditions of growth and when later in the season only a very few maggots are in the stem of such plants as cauliflower and cabbage no serious injury will result. We have found in the roots of a single plant as many as 127 maggots, and under such conditions, of course, the plant is either soon killed or its marketable value greatly reduced. This statement applies particularly to early grown crops of cauliflowers, cabbages, turnips and radishes.

We have observed young maggots after hatching from eggs penetrating to the root system. Their main object is to avoid light, and the quicker the penetration occurs the more likely are the young maggots to survive. Those maggots hatching from eggs deposited near the stem are attracted to the crevice formed between the stem and the soil. Many hatching from eggs deposited at a short distance from the stem of the plant on the surface of the soil, in all probability pass down through the soil until a root is reached. In laboratory experiments performed with freshly hatched maggots, carefully transferred to the surface of the soil, even when they were placed at half an inch from the stem of the plant, they burrowed downwards to the roots through some slight crevice in the soil. During such observations they were seen to stand upright with their heads inserted in a crevice, gradually working their way into the soil, until finally they became lost to view. In the laboratory, when the soil was compacted on the surface, the young maggots were unable to burrow.

In the Ottawa district of eastern Canada the conspicuous indication of the presence of the maggot in cauliflowers and cabbages, particularly the former, is very apparent early in July, at which time the weather is very often hot and sultry. Although the maggot in Canada is present throughout the entire growing season, it is largely in May and June that the important injury to the plants is effected. In the Ottawa district entire crops, particularly of early cauliflowers and radishes, have been destroyed before the middle of June.

As mentioned above, a few maggots present in the stem would not destroy such plants as cabbages or cauliflowers, but it is different, however, in the case of radishes or garden turnips, the presence of one or two maggots being sufficient to render them unfit for the table. In the Lower Fraser Valley of British Columbia the maggot is specially injurious to plants grown in the open seed bed. In 1913 as high as 98 per cent of plants in certain beds were killed before the end of May. Radishes were also injured in the same month to a like extent. During the last two years, however, we have grown at Agassiz, B. C., crops of radishes in open cold frames during April practically free from maggot attack. Egg laying is continuous throughout the growing season and from reference to the question of egg fertility there must be large numbers of the maggots present from early summer until late autumn. This is proven by the fact that in eastern Ontario, where we have grown crops of radishes during the entire season, larvae have been found freely in the roots of plants up till the middle of September and in late cabbages as late as November 9. In this latter month the larvae have also been found in considerable numbers at Agassiz, B. C., in the roots of both turnips and cabbages.

Susceptibility of Plants

As is well known to market gardeners, cauliflowers succumb to the attack of the maggot more readily than cabbages. This does not appear to be a result of any special choice on the part of the fly to oviposit on cauliflowers over cabbages, as our records indicate that the opposite might be the case. For instance, for a period of 17 days, between June 25 and July 11, 1915, at Agassiz, B. C., 1418 eggs were deposited on six cabbage plants while 1038 eggs were laid on six cauliflower plants. In our work with this insect we have learned to accept the vagaries of the adult in the matter of egg deposition, hence we do not claim any special preference on the part of the fly to oviposit on any special variety of plant during the height of the egg-laying period. Records have been published at various times by those who have studied this insect in relation to crops, which were obviously based on actual results, indicating that a possibility of relief from attack might be expected in this connection. Our work, however, has shown that an apparently conclusive result of one year might be entirely reversed in the following year, and further that results might conflict even within a single season's work. This has made such a study very difficult. We consider that the supposed susceptibility of cauliflowers over cabbages is probably due to the lesser vitality of the former plants.

Seed bed trials have been conducted at Agassiz, B. C., with many different varieties of both cabbages and cauliflowers, in order to prove whether or not there existed an immune or a non-suscepitble variety of plant. Some of the Red Cabbages in our experiments were less attacked than many other varieties but from a confusing amount of data we are forced to the opinion that in all probability nonsusceptible plants do not exist.

Other Causes of Injury

In addition to the damage effected by the Cabbage Root Maggot, there are two other types of injury which annually cause much destruction and which are often confused with root maggot injury. One of these is a damping-off fungus and the other is known as Club Root. In some years the damping-off fungus is extremely destructive in seed beds of cauliflowers and cabbages, thousands of young plants being destroyed. This disease, as its name would indicate, finds ideal conditions for development in dampish situations, and its presence in a seed bed is noticed by the falling over and dying of the young plants. The other disease, Club Root, occurs freely in eastern Canada under field conditions, an destroys cabbage, cauliflower, and and destroys cabbage, cauliflower, and

Reproduction

Oviposition.—The female fly, previous to oviposition, may be seen hovering around food plants, settling on the leaves and on the ground. When prepared to deposit eggs the fly will move over the surface of the ground with moderate activity, in search of a suitable place to oviposit. Eggs have been observed both at Agassiz, B. C., and Ottawa, Ont., deposited on the surface of the soil within a radius of two inches from the stem of the plant. The eggs are most abundant nearer the stem and far the greatest numbers are deposited on the stems or in the crevice surrounding the stem of the plant. We have taken during July at Agassiz, B. C., from a single cauliflower plant 101 eggs deposited within 24 hours. This indicates the activity of flies during the height of the mid season oviposition period, and shows further that several females deposit eggs on the same plant in a single day. It is interesting to consider the reason why the female fly deposits her eggs so commonly on the surface of the soil around the stem of the plant. The answer doubtless lies in the fact that the shape of the leaves and their relative placing on the stem of the plant are particularly adapted to collect all available moisture in the form of rain or dew and pass it down the stem to the surface of the soil. In this manner whatever surplus moisture is left by the leaves will reach the soil within half an inch of the stem and thus affect the eggs.

Later, in the autumn, eggs have been observed deposited on the stem of the plant above ground and also on the fleshy leaf stalks, but this location for oviposition from our observations is not considered as being a very common habit even at the time of the year when the roots of the plants are old and hard.

Our notes, taken at Agassiz, B. C., in 1915, record oviposition until October 22, and almost invariably the eggs taken about this date were observed attached to the plant just below the surface of the soil in close proximity to the stem. Cold, damp weather causes the flies to cease ovipositing on plants, hence the close of the oviposition period in the Lower Fraser Valley of British Columbia occurs conjointly with the approach of the autumn rains.

A chart has been made of the egg deposition of the flies during the season of 1915 at Agassiz, B. C. During the early part of the season—April 17 to May 20—exact records were kept on the actual daily deposition of eggs on twenty-five radish plants. The examination of these plants, as with the examination of the cauliflowers and cabbages which is mentioned later, consisted in carefully counting and removing all eggs once a day, usually about the noon hour, placing them in vials, and later counter-checking them in the laboratory. In this way we believe we have obtained an exact representation of the egg laying habits of the fly, showing not only the number of eggs laid, but the relation between egg deposition and meteorological conditions. The number of eggs removed from the radishes between April 17 and May 20, while based on the record of twenty-five plants, has been reduced on the chart to read on the average of one plant, for the sake of convenience.

At the time this record from radishes was being obtained the seedling cabbages, cauliflowers and brussels sprouts were growing under a cheese cloth screen, hence the small patch of radishes from which twenty-five had been selected on which to observe oviposition was practically the only attraction for the flies in the immediate neighborhood.

On May 13 and 14, 1915, the transplanting of cabbages and cauliflowers (2,500) took place. Twelve cabbage plants were selected on which to observe oviposition, daily notes being taken between 4 and 6 p. m. in this instance. Observations on the plants were begun at time of transplanting and continued until September 30, by which date the plants had become too large and unwieldy to make accurate observations, in fact some were showing decay. Eggs were first observed on adjacent cabbage plants on May 16, and on the days following, but no eggs were observed on the twelve plants under observation until May 21. From this date, therefore, until September 30 daily notes were kept on the egg deposition.

Between June 20 and July 11 six cauliflower plants were selected from different parts of the field, from which to collect data in regard to the egg deposition on cauliflowers as compar-

ed with cabbages. The results of our findings in this connection are mentioned later, and we were satisfied at the time that the cabbage plant was chosen for egg deposition in preference to the cauliflower plant.

During the week following July 11 an occasional examination of the cauliflower plants repeatedly revealed the possibility that our records just obtained were not being sustained, and consequently our former deductions might be incorrect. Hence the daily examination of the six cauliflower plants was again commenced on July 20 and continued from this date until October 26.

It does not seem possible, however, to obtain a true record of the egg-laying habit of the fly from one kind of plant. Our records indicate clearly that we would incline toward a wrong interpretation of the autumn habits of the fly if we confined, for instance, our records to cabbages alone. From what has been stated and from an examination of the table showing numbers of eggs laid on individual plants, egg deposition on cauliflowers in September and October would indicate marked activity on the part of the adult flies, while on cabbages the number of eggs deposited during that period was comparatively few.

The maximum and minimum temperatures, the sunshine and precipitation records, are also given in the chart, hence with the information relative to prevailing climatic conditions placed in comparison with the daily increase and decrease of the egg depostion records we are able to observe more clearly how such conditions affect the habits of the adult fly.

The female fly does not seem to follow any regular practice in laying her eggs. On many plants these will be found laid singly, in groups of two, three or four, or the eggs may be found in masses comprising as many as 15, 18, 20, and even 30.

The following represents the data obtained in the course of the egg deposition experiments just outlined:

Eggs Laid on Individual Plants

Crop, radish; number of plants examined, 25; actual number of eggs deposited, 3,437; dates, April 17 to May 20; average number of eggs per plant 137.4.

Crop—Cabbage, transplanted May 13th:

Plant No. 1—May 21 to 31, 0; June, 156; July, 98; August, 50; September, 32; total, 336.

Plant No. 2—May 21-31, 16; June, 307; July, 153; August, 254; September, 33; total, 763.

Plant No. 3—May 21 to 31, 8; June, 277; July, 263; August, 164; September, 26; total, 738.

Plant No. 4—May 21 to 31, 6; June, 14; July, 250; August, 66; September, 2; total, 338.

Plant No. 5—May 21 to 31, 5; June, 234; July, 217; August, 8; September, 20; total. 484.

Plant No. 6—May 21 to 31, 2; June, 299; July, 610; August, 72; September, 13; total, 996.

Plant No. 7—May 21 to 31, 5; June, 231; July 252; August, 73; September, 13; total, 574.

Plant No. 8—May 21 to 31, 36; June, 304; July, 120; August, 0; September, 0; total, 460.

Plant No. 9—May 21 to 31, 5; June, 158; July, 8; August, 1; September, 0; total, 172.

Plant No. 10—May 21 to 31, 1; June, 277; July, 118; August, 28; September, 14; total, 438.

Plant No. 11—May 21 to 31, 0; June, 456; July, 136; August, 6; September, 0; total, 598.

Plant No. 12—May 21 to 31, 2; June, 413; July, 252; August, 36; September, 2; total, 705.

Crop—Cauliflower, transplanted on May 14:

Plant No. 1—June 20 to July 11, 128; July 20 to 31, 262; August, 127; September, 168; October, 126; total, 811.

Plant No. 2—June 20 to July 11, 251; July 20 to 31, 249; August, 222; September, 142; October, 63; total, 927.

Plant No. 3—June 20 to July 11, 176; July 20 to 31, 3; August, 120; September, 98; October, 24; total, 421.

Plant No. 4—June 20 to July 11, 263; July 20 to 31, 163; August, 454; September, 241; October, 122; total, 1,243.

Plant No. 5—June 20 to July 11, 148; July 20 to 31, 100; August, 303; September, 445; October, 67; total, 1,063.

Plant No. 6—June 20 to July 11, 224; July 20 to 31, 254; August, 329; September, 217; October, 26; total, 1,050.

Collective Data

Total of 6,602 eggs were laid on twelve cabbage plants between May 21 and September 30 (133 days), an average total per plant of 550.1, or an average of 4 eggs per plant per day.

Total of 5,515 eggs were laid on six cauliflower plants between June 20 and October 22 (117 days), an average total per plant of 919.1, or an average of 7 eggs per day per plant.

Some most important and interesting information is to be derived from the above figures. We observe that during the season of 1915, 137.4 eggs were laid around a single radish in the early spring; 550.1 were laid around a single cabbage plant during the summer, and 919.1 eggs were laid around a single cauliflower plant between June and October.

To illustrate the degree of infestation in the plantation in which these records were obtained, it may be stated that from 215 untreated cabbages 26 died as a result of maggot attack (12.1 per cent), and of 210 untreated cauliflowers 24 died (11.4 per cent) during the season of 1915. Many other plants of course were infested by the maggot, but the plants survived the attack although the size of the heads was more or less affected.

During the course of the work involved in taking this egg deposition record it was observed, in the case of radishes, as also in the case of the cauliflowers and cabbages, that the larger plants seemed to attract the adult flies, in consequence of which more eggs were taken from stronger growing plants. It is impossible to say whether this is an invariable rule, but nevertheless we have facts to support this contention so far as our work goes. For instance, cabbage plant No. 4 was checked in its growth in the seed bed, probably by a light attack of a fungous disease; at any rate it required considerable care to enable it to survive after transplanting; as a result, during May and June it remained fully half the size of the other plants under observation. The egg deposition on this plant, it will be noticed, was 20 eggs for the two months.

Then again cabbage plant No. 9 was a strong growing plant in the first six weeks of its life, but early in July its leaves commenced to discolor. It was impossible that maggots were attacking the roots, as all eggs laid around the plant from the day of transplanting had been removed. On examination it was found that a mole had passed directly beneath the plant, thus interfering with the root system. A check, therefore, in its growth resulted, from which apparently it never recovered. It will be noticed that 9 eggs were deposited around this plant during July, August and September. It seems apparent, therefore, that there is a relation between the size of the plant and the number of eggs deposited. The choice of the larger plants was also very clearly evidenced in the egg counts on individual radish plants.

It was noted, further, in the study of the egg deposition that frequently long stemmed plants were preferred to the plants with short stems, on days of bright sunshine and in fine weather. In cloudy, windy or rainy weather it was frequently observed that the adult flies sought the shelter of the short-stemmed, broad-leaved plants which afforded greater protection from the elements for the purpose of egg deposition. A glance at the egg deposition figures will show that cauliflowers attracted flies more than did the cabbages. The former, of course, is well known to have a tall, erect habit of growth.

It will be observed, therefore, from these few statements that the question of the severity of an attack by the maggot is partially answered by a consideration of climate, size or health of the plant.

(To be continued in our next issue.)

DR. C. C. JAMES HAS PASSED AWAY

The agricultural interests of Canada have lost a faithful and distinguished worker in the person of Dr. C. C. James, Agricultural Commissioner, who died of heart failure on the evening of June 23d while on an electric car en route from St. Catharine's to Niagara-on-the-Lake.

Dr. James was born in Napanee, Ont., on June 14, 1863. He was graduated in natural science by the Victoria College, Cobourg, in 1883, and in 1886 he took his M. A. degree from the same institution. For the succeeding five years he was associated with the Agricultural College at Guelph as professor of chemistry, and through his activities there was instrumental in having the college affiliated with the University of Toronto, so graduates of the Guelph institution could qualify for a degree of Batchelor of Scientific Agriculture from the university. In June, 1891, he was called to the Provincial Government as Deputy Minister of Agriculture and Secretary of the Ontario Bureau of Industries under the late Hon. John Dryden, and it was in this capacity that he became so well ad favorably known to the people of Ontario and other provinces. Under the various ministers of agriculture for twenty-one years, C. C. James was the guiding star in the agriculture of Ontario, and to his wisdom and intimate acquaintance with all matters pertaining to farm life are due the credit for many reforms and much good legislation. The District Representative System, inaugurated in 1906, and now grown to considerable proportions, is outstanding among his later accomplishments while a servant of Ontario. In February of 1912 Dr. James resigned his office as Deputy Minister of Agriculture, and was appointed by Hon. Martin Burrell, Canada's Minister of Agriculture, to study conditions throughout the Dominion and advise his department as to the best policy the government might adopt relative to that particular industry. One tangible result of that investigation was the Agricultural Instruction Act and the appropriation of $10,000,000 for agriculture, to be expended throughout a period of 10 years. Later Dr. James became Commissioner for Agriculture, and this capacity he was very actively connected with the administration of the act. Perhaps no man in public life in this country has considered the war more seriously than did Dr. James; not only as it affected Canada and Canadians, but from the viewpoint of the Empire and civilization as a whole. He was enthusiastic regarding the patriotism and production campaign of 1915, and untiring in his efforts to inspire the people of his country to produce all in their power, that the nation might be strengthened and the soldiers fed. The production and thrift movement also had his able support, and the two Agricultural War Books are the result of his labors.

A brilliant literary student and lover of poetry and historical subjects, Dr. James maintained a high academic standing besides his activities in the councils of agriculture. He was a member of the Board of Regents of Victoria College, of which he was a distinguished graduate and a member of the Senate of Toronto University. The latter institution in 1912 conferred upon him the honorary degree of Doctor of Laws, and in 1911—the Coronation Year—he was made a Companion of St. Michael and St. George, C. M. G., by the King. He had also served as President of the Ontario Historical Society, and in 1905 was elected a Fellow of the Royal Society of Canada. He was a forceful speaker and writer, and many works have been published on historical and agricultural matters which came from his pen.

The late Dr. James is survived by his wife, to whom he was married in 1887, and one son, Lieutenant Wilfrid C. James, of the 142d Battalion. The immediate family and relatives are not alone in mourning the loss of this pioneer and friend of agriculture, who for three decades labored in the interests of the farmer. His departure will be regretted by all Canada, the country he served so well.

THE FALL FAIRS

A short time ago we addressed letters to the managers of the various Maritime Fall Fairs, inquiring about their respective dates. At the time of writing we have replies from several of them. On another page of this issue will be found the advertisement of the Halifax Exhibition, which will be held from the 13th to the 21st of September. The prize lists are out, and persons who have not yet received same can have them by writing the secretary, M. McF. Hall, Halifax. The prize list is a generous one, and we look for a full house at Halifax when the fair opens.

H. A. Porter, secretary of the St. John Exhibition, writes:

"Nothing doing this year. Our buildings are all equipped as barracks and it would mean an expenditure out of all proportion to rip out the present fixtures and restore them after an exhibition, even if we could obtain permissio to use the military grounds, which in itself is very doubtful."

W. S. Hooper, secretary of the Fredericton Exhibition, says:

"No exhibition in Fredericton this year. We were all ready to go ahead again this year, at the request of the St. John Exhibition Association, as their plant was (and is) occupied for military purposes, with the end in view of letting St. John take our regular year, 1917, but the government felt they were not in a position to give us the usual grant two years in succession; hence, much to the regret of the agriculturists in general all over the Maritime Provinces, the year 1916 will be a blank as far as big exhibitions are concerned.

"At a meeting of our Board of Directors held last week, it was decided unanimously to proceed with the usual biennial show on our regular dates in 1917, when we trust, all things being equal, to once again occupy some of the advertising space of your valuable journal."

D. R. Nicholson, the secretary of the Sydney Exhibition, informs us that their exhibition will be held on October 3d to 6th.

Strawberries should be graded same as any other fruit. Spread them carefully on a table, and sort them into three grades—fancy, No. 1, and culls.

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; inches—First insertion $2.25.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or
R. D. Robinson Publishing Co., Limited
Sussex, N. B.

Toronto Representative—J. Lester Davis, Miln Building 8 Johnson Street.

Montreal Representative—Dakers Cameron, St. Nicholas Building.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this offiee one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

A BARLESS CANADA

One of the first principles adopted by the publishers of **The Maritime Farmer** was that the columns of this paper should never be stained, nor its readers insulted, by giving space to intoxicating liquors advertising. This principle has been strictly adhered to during the twenty-one years that **The Farmer** has been a regular visitor to the best homes of the three Maritime Provinces and elsewhere.

Twenty-one years, did we say? Yes, twenty-one years. We have at last arrived at that age to which every manly young man looks forward with so much interest—the time when he can exercise his franchise.

In the twenty-one years that have gone by since the inception of **The Maritime Farmer** we have on many occasions been offered very tempting advertising propositions by the liquor interests, but to each and every one of them we have turned a deaf ear. There have been times when we would have materially profitted had we acquiesced and accepted liquor advertisements. Thank God we did not, and do not, like the price of blood. Neither did we, nor do we, care to help foster an industry that has brought, and is bringing, so much misery and degredation to the men, women and children of our land.

During its boyhood **The Maritime Farmer** has stood the test, and now in its manhood it has no fears for the future. We have with no uncertain sound stood up for the cause of temperance, and we have no apologies to make for doing so.

We are glad to note that **The Maritime Farmer** is not the only journal that takes this stand. In a recent issue of Good Housekeeping Magazine the following editorial, under the caption of "Two Men—and a Third," appeared:

"On April 1 Mr. Ogden Reid, proprietor of one of New York's oldest newspapers, The Tribune, caused to be inserted in his paper a notice of which the following is a part:

> " 'From today on The Tribune will publish no liquor advertisements. We have discontinued this sort of advertisely purely as a matter of business policy . . . Indulgence in alcohol is incompatible with efficiency in any field of effort. In industry, trade, and transportation, as well as in artistic and professional pursuits, the man who uses alcohol habitually imposes on himself a serious disability . . . We feel that liquor advertisements will not attract to us either the readers or the advertisers whose patronage we especially desire. We have therefore decided to drop liquor advertisements altogether.'

"In this commendable stand the proprietor of The Tribune was but following the lead of Mr. William Randolph Hearst, who on January 9 gave instructions that the use of his papers be denied to alcoholic liquors and habit-forming drugs. This meant that more than two million men could thereafter read their daily paper without having the invitation to "take a drink" stare them in the face. It was a decision of tremendous moral significance; generation after generation will increase its worth.

"These are the two men. On February 10, and many times thereafter, Mr. Adolph S. Ochs allowed to be inserted in his paper—The New York Times—this liquor advertisement:

> " 'Total abstinence is a form of fear—and fear is the cause of failure.
>
> " 'Cast out fear and be temperate or moderate in all things.
>
> " 'The temperate or moderate man calls for that wonderfully mild and mellow whiskey——'

"The name of the whiskey does not matter; what matters is that a newspaper which makes a claim to probity can be so debased by the money which the whiskey manufacturers are willing to spend freely in the few—and constantly becoming fewer—places where it will be accepted in exchange for carrying appeals that lead some readers to part with money, some with self-respect, some with honor, without the slightest value in return. Dr. Wiley says of this particular 'ad' that it is the most pernicious he has ever seen. At the man who is walking uprightly it points a finger and calls "Coward!" It unlooses a train of suggestions in the mind of the man who is not firmly fixed in his course, and has doubtless led thousands to "that wonderfully mild and mellow whiskey"—the kind that leads by a devious path to the same hell of moral shipwreck to which the usual counter whiskey leads directly.

"This is the third man. All of them, and their papers, are known throughout the United States. Perhaps the 'total abstinence' in the papers of the two will encourage other newspaper owners; we trust that the 'moderate' sophistry in the third will fall as seed upon stony ground."

In the not distant future we will undoubtedly see a barless Canada. Such an accomplishment would have been predicted an utter impossibility ten years ago, but today it comes with but little public effort. It gives expression to a pronounced awakening of public opinion, resulting from our present national economic condition.

Manitoba, Saskatchewan, and Prince Edward Island now have prohibition, and Ontario will be dry in September next. Alberta will come under prohibition during the summer. On July 1st the Nova Scotia Temperanct Act came in force in Halifax. Forty-six saloons, including the hotels, closed their bars at midnight June 30th. On March 15th the city granted them licenses for one year, but the legislature has passed the act declaring the licenses void. New Brunswick and British Columbia are taking action in the same direction, and the New Brunswick prohibitory law comes into force on May 1, 1917. This leaves only Quebec to lag behind. The majority of rural districts in Quebec have experienced the beneficial results of local option, and may agitate for further restrictive measures to the liquor traffic.

FIRE PREVENTION

Fire losses are so tremendous in volume as to be appalling, amounting yearly to hundreds of millions, mostly in the towns and cities. Yet they affect rural communities in more ways than one, primarily in cost of a fire insurance policy wherever the risk. Again, cost of insurance borne by the manufacturer, the merchant, the transportation company, add just that much to overhead expenses and in turn are passed on to the consumer. The New York Journal of Commerce shows losses by fire in the United States and Canada the first three months of this year at just a little short of $85,000,000; grand total for March alone over $38,000,000.

While frequency of fires in the country is less than in congested city districts, lack of fire-fighting facilities usually means a complete loss once a fire is under way. With the largely increased use of fuel oils for automobiles, tractors, or stationary engines, the hazard is keener now than a few years ago. The necessity for watchfulness and proper equipment for fighting fire in its incipient stage is therefore all the more necessary. Clean-up week is worth while, if no other reason, because it stimulates care in this direction, to remove all rubbish and see to it that it is not allowed to accumulate.

More than once it has been pointed out in these columns that the farm should be equipped with some sort of fire extinguisher so placed that it can be brought into immediate use at the first sign of fire—something which can be operated readily by the farmer's wife or children as well as by himself. Long ago it became a recognized fact that these small fire extinguishers have many things to commend them and are thoroughly trustworthy. Various patterns are on the market and obtainable at small cost. Some of these are most valuable for extinguishing gasoline fires; water in such cases is practically useless. Attention to details, of course, including the fact of adequate water supply, will afford protection in untold numbers of instances, putting out incipient fires and preventing what to the farmer is a veritable conflagration.

CHEAP WAY OF BREEDING

We believe the cheapest way for a man of limited funds to get the use of a pure-bred sire is to encourage a bunch of his neighbors—say a dozen—to co-operate with him. The man with limited funds can hardly afford to pay the price for a pure-bred sire for his own exclusive use. The more fortunate neighbors will not want to waste money in exclusive ownership, either; so I would suggest a practical way is to own a pure-bred sire in a neighborhood partnership; then all can use him until his usefulness is exhausted by reason of relationship to the cows of the community. Then he may dispose of him to some other equally wise neighborhood.

THE NEW BRUNSWICK PROHIBITION ACT

As stated on the previous page, The Maritime Farmer has no apologies to offer for championing the cause of prohibition. The fight is on to dry-clean New Brunswick. The opposing forces are fighting "tooth and nail." It is a fight of right against wrong. It is a fight in which the friends of temperance cannot afford to be lethargic. You in your small corner, and the other fellow in his, must do your utmost if your cause would triumph.

Following are the essential features of the New Brunswick Prohibition Act, which will come in force in your county as soon as the Scott Act is repealed:

On December 10th, 1915, the representatve of the Dominion Alliance waited upon the Government, asking for the passing of a Prohibition Law for the whole Province, and to come into effect after a referendum vote.

The Government agreed to the request of the Alliance to enact a Prohibitory Law and to take the Allance into its confidence in the preparation of the same.

A committee of seven members of the Alliance was appointed to confer with the counsel appointed by the government to draft the bill.

On a number of occasions the committee met to consider the different sections of the bill, and gave to it lengthened and careful consideration.

With the exception of a few sections, the bill met with the hearty approval of the committee, which is of the opinion that the act passed by the legislature is one of the best anti-liquor laws known, and if properly worked will accomplish the purpose in view.

The government assumed full responsibility for the bill as a government measure, and for the bringing of it into force without the necessity of a referendum.

The legislature passed the measure with only two dissenting votes.

In counties under the Scott Act it is necessary that repeal elections be held before full advantage can be taken of the new law.

Inasmuch as copies of the new Prohibition Act will not be available for some time, it has been considered advisable to issue this brief statement of the essential features of the act:

Prohibitions

1. All licensed barrooms and clubs will be abolished, and thus the treating system will be eliminated. Sections 25, 26.

2. This measure prohibits keeping any liquor in hotels, clubs, offices, places of business, boarding houses, etc. (Clause t, Section 2.)

3. This law prohibits any one from advertising liquor upon any vehicle of transportation, or at any public place or resort, or upon any sign or bill board in the Province. Section 38.

4. This act prohibits treating and drinking in public places. It is an offence to treat or offer liquor of any kind to any person in any street or car, or upon any railway passenger car or coach or platform while the train is in the service of passenger transportation in the Province. Section 6.

5. This act prohibits any one under the influence of liquor to drive, operate, or have charge of the power or guidance of any automobile, motorcycle, or any motor vehicle propelled by other than muscular power. Section 201.

Permissions

6. Provision is made for the sale of liquor for medicinal, mechanical, scientific, and sacramental purposes through licensed drug stores. Section 2 (n) (o).

7. Hospitals are permitted to keep liquor for the use of patients, and sick persons are allowed to have liquor in their room. Section 40-41.

8. Properly qualified persons such as druggists and doctors, etc., can obtain alcohol for strictly medicinal, mechanical, or scientific purposes. Section 2, Clause n.

9. A householder is allowed to keep liquor in his own home for his private use, provided it is not purchas d within the Province. Section 8-9.

Penalties

10. A fine of not less than fifty dollars and not more than two hundred dollars, and in default of immediate payment to be confined to jail for not less than three months nor more than six months, is the punishment for first violation of this act. For a second offence no fine is made, but the offender will be committed to prison for not less than six months nor more than twelve months, and in the discretion of the magistrate he may be put at hard labor; and for a third offence to be committed to jail for not less than nine months nor more than twelve months; and for every subsequent offence to be imprisoned at hard labor for one year.

An Effective System

11. When any constable, policeman, or local inspector sees any person in a state of intoxication or with liquor in his possession, that officer can cause said intoxicated person to go before a magistrate or a justice, or any town clerk, and have him tell where he got his liquor. He shall make an affidavit or affirmation as to where he got such liquor, and failure to do so to the satisfaction of the person taking the affirmation he can be arrested and imprisoned until he makes such affidavit or declaration. Sections 170-171.

Civil Remedy Section

12. A civil remedy is provided by the Act in the case of a person whose death has taken place while intoxicated. When any person who has drunk liquor which has been illegally furnished to him comes to his death by suicide or drowning, or perishing from cold or other accident, the person who furnished the liquor becomes liable to an action for personal wrong at the suit of the legal representative of the deceased, who may recover damages of not less than $100.00 and not more than $1,000.00, as may be fixed by the court. Section 175.

When and How it Becomes Operative

13. In every county of the Province where the Canada Temperance Act is now in force this act will come into operation immediately upon the repeal of the Canada Temperance Act. In those counties where the New Brunswick License Law is now in force this act becomes operative on May 1, 1917.

Some of the Things That Make the New Temperance Measure Superior to the Scott Act

In the matter of search under the Scott Act endless trouble was caused by the system followed. It was necessary under this law for the inspector, before he could make a search, to swear out a search warrant, which said warrant could only be executed in daytime. Now, any one who knows anything at all about the enforcement of this act knows that this system was a most prolific one for trouble, for by the time the warrant was obtained, and before it could be executed, somehow or other the information had gone abroad.

Now under the new prohibitory law this trouble will be avoided. Where the proper officials have just and reasonable grounds for suspecting that an illicit trade is being conducted, all that will be necessary will be for them to make the search. This simplifies matters.

If it is a private dwelling house that is suspected of violating the law, then a search warrant is necessary, but the search can be made at any time or times within ten days from the date thereof.

The house, or any part of it, can be entered by force if need be and searched for liquor. The officer can examine any document containing entries in connection with liquor. He may, if he deems it ecessary, break open any door, or lock, or fastening, or closet, or box, or other article he suspects to contain liquor. Not only so, but if liquor is found to be kept illegally then the officer having the warrant can arrest the person keeping the liquor.

The new prohibitory law is much more up to date than the Scott Act as far as penalties are concerned.

For a first offence under the Scott Act the fine is $50.00 or one month's imprisonment.

Under the new law the penalty is a fine of not less than $50.00 and not more than $200.00, and in default of immediate payment to be imprisoned for not less than three nor more than six months.

For second offence under the Scott Act the fine is $100 or imprisonment for two months, with or without hard labor.

Under the new law no fine is given, but the offender will be sent to jail for not less than six nor more than twelve months.

For a third offence under the Scott Act the offender is given a term of imprisonment not exceeding four months, with or without hard labor.

Under the new law, for a third offence the offender will be sent to jail for not less than nine months nor more tha twelve months.

Then, because matters have been simplified in procedure, it will be easier to get second and third offenders under the new law.

One of the important sections, and one that shall be far reaching in its effects, is the following:

"No person shall by himself, his clerk, servant, or agent send, ship, or cause to be sent, or shipped, or bring, or carry, or cause to be brought or carried from any place in the province any package containing liquor to any person in any part of the province other than a licensee duly appointed under this Act, or to a clergyman or other person legally entitled to receive such liquor."

"No common carrier, express company, or other carrier shall accept from any person in any part of the province any package containing liquor for carriage or delivery to any person in any part of this province other than to a licensee duly appointed under this act, or to a clergyman or other person legally entitled to receive such liquor."

This new act means that on the first day of May, 1917, every barroom and saloon in this province will close its doors and go out of business. It means that when this act comes into operation no society, association, or club, either by its members, officers, or servants, or any one resorting thereto, can sell, barter, or give liquor without violating the law.

DO NOT OMIT POTATO SPRAY

The potato spraying situation for the season of 1916, like the fertilizer question, has its own peculiar difficulties. The Maine station makes the following statement: It is not presented as a full solution of these difficulties, for the causes underlying them are beyond local control, and the fact cannot be avoided that the potato grower must pay more this year for protection from blight and "bugs" than ever before. The object of the statement is to point out certain facts which if more generally known may prevent a waste of money and a lack of efficiency in spraying operations under the present conditions.

The chief object for sprayig potatoes is to prevent blight and to control the Colorado beetle. For combating late blight and preventing the tuber rot which follows it, freshly and properly prepared bordeaux is in a class by itself. Regardless of the extravagant claims which manufacturers of certain proprietary compounds have made in the past, or are likely to make, no substitute which they have put out, nor any other material yet used, which can be prepared on the farm, has stood the test when compared with bordeaux in accurate field experiments.

This coming season potato growers will be tempted as never before to use these spray substitutes. The war in Europe has created enormous demands for the copper and sulphuric acid that are used in making copper sulphate, which furnishes our active, fungicidal agent of bordeaux. As a result copper sulphate will be more expensive than it has been since it came into prominence as a fungicide, but it is not expected that the price will be prohibitive.

Even with the prospective high price of copper sulphate, the Maine station, in the light of experience here and elsewhere, does not advise potato growers to take chances by using substitutes for bordeaux in spraying for late blight of potatoes. There are just two reason for taking this position, but they are important reasons. They are that these substitutes almost without exception, regardless of the claims made by manufacturers and salesmen, cost more and are relatively less efficient—sometimes nearly worthless. In 1907 this station made some experiments in Foxcroft on the farm of, and in co-operation with, A. W. Gilman, commissioner of agriculture, where certain paste and powder substitutes were compared with freshly and properly prepared bordeaux for spraying potatoes. The average loss from using these substitutes, as compared with home made bordeaux, computed on the basis of the price of potatoes when the crop was dug, varied from $33 to $75 per acre.

In certain instances, notably for spraying apple orchards for scab, lime sulphur has largely replaced bordeaux as a spray. This material would provide a very easy solution of the difficulty if it would work equally as well on potatoes. All information to date relative to the value of lime sulphur as a spray for potatoes indicates that the benefits to be derived from it are very doubtful and there is quite positive evidence that it may be actually harmful to potatoes.

Conditions in Europe have also affected the cost of insecticides, more especially paris green, which contains copper as well as arsenic. Fortunately, certain compounds of soda and arsenic provide a soluble poison which is relatively cheap and very efficient when used for potato bugs. These materials under trade names have been sold and widely and successfully used in Maine, particularly in Aroostook County, during the last few years. Unlike paris green, they cannot be used alone, but must always be applied with bordeaux.

Because one must grow potatoes this year without potash, unusual care must be taken with the crop to prevent failure. In 1916, as never before, it behooves potato growers to: Thoroughly prepare the seed bed. Use the best seed, carefully selected. Treat the seed with formaldehyde or corrosive sublimate for scab. Cultivate frequently and well, spray with bordeaux early and often. The wetter the weather the more frequent the sprayings should be. Use a poison with the bordeaux when the eggs of the Colorado beetle are found on the potato leaves. —Dr. C. D. Woods, Maine Station.

Editor's Note.—The standard bordeaux spray is four pounds each of copper sulphate and fresh lime to 50 gallons of water; add three to five pounds arsenate of lead to potato bugs.

Fortunate is the man who has no time to take advice because he is too busy selling it.

HORTICULTURE.

POISONED SPRAYS AS A BAIT FOR THE FLY OF THE APPLE MAGGOT

Ever since the publication of F. L. Harvey on the Apple Maggot in 1889, this insect has figured in Maine entomological literature as an apple pest of serious economic importance.

From the protected situation of the maggot within the fruit, it is evident enough that sprays will avail nothing against this insect in the larval stages. Based upon this fact, the control measures recommended have been for years confined to the various methods of the destruction of the infested fruit with the object of preventing the maturing of the fly and thus reducing the number of maggots for the succeeding year. These measures are still as important as ever and should not be lost sight of or neglected. Where it is practical to carry them out thoroughly, no other remedy would seem to be needed.

Within the last few years, however, there have arisen hopes that the apple fruit fly, or adult of the apple maggot, might be induced to lay up poisons sprayed upon the trees previous to her egg laying, and the infestation of apples by her numerous progeny thus be prevented by her death.

As long as ten years ago one York County orchardist insisted: "I keep my trees well sprayed with paris green and my apples are free from maggots, while my neighbors, who do not spray, harvest fruit unfit for the market." It is not uncommon to hear an Oxford County man protest: "In commercial orchards properly sprayed with arsenicals against other pests, the apple maggot does not enter as an element of importance." On the other hand, there are Maine orchards apparently well sprayed with arsenicals where the appearance of the apple maggot is an annual occurrence.

Such conflict of testimony is by no means confined to Maine, nor to the practical orchardists.

We find Mr. W. C. O'Kane concluding after several years experimenting: "Poison bait sprays, as so far devised, have entirely failed to insure protection of the fruit of the sprayed trees from attack by the maggot. In part of the experiments there was apparently some improvement of the fruit, especially in isolated trees. This may have resulted from the death of flies because of the spray, or it may have been due to various other factors. The important point is that no such protection was forthcoming as would be essential if the treatment were to be ranked as an effective means of control."

The conclusions of Mr. J. F. Illingworth, of the Cornell Agricultural Experiment Station, in 1912, were favorable to the use of sweetend arsenical sprays.

Mr. W. A. Ross, in the Report of the Entomological Society of Ontario for 1912, says: "Tested two spray mixtures, one composed of arsenate of lead, glycerine and molasses, and the other of paris green ,glycerine and molasses, but neither yielded satisfactory results in the control of the apple fruit fly in Ontario."

An article by C. A. Good in the Co-operative News, in 1915, reports concerning spraying for this pest in Nova Scotia: "Summing up, then, so far the sweetened poison spray has been effective in the control of the apple maggot, although, of course, another season's work must be done before passing final judgment."

In view of the lack of uniformity of initial results in this very complex problem, and the serious work of the apple maggot in Maine, it seemed advisable to have experiments conducted under local conditions in this state. The Maine Agricultural Experiment Station accordingly secured in this connection the services of Dr. Henry H. P. Severin, a man experienced in the use of poisoned bait sprays for various flies, and in touch, through literature and correspondence, with other experts interested in the same problem both in America and abroad.

The experiments were for the most part confined to soluble poisons because these are more rapid in their action than the insoluble aresnates, and it was believed that if these did not prove effective in killing the flies it was of little use to experiment with the slower poisons.

The following paragraphs are quoted from the report of Dr. Severin:

"Formula.—In 1915 the following formula of the poisoned bait was used in spraying the six orchards and the apple trees in the residential section:

"Potassium arsenate, ¾ oz., dissolved in boiling water; molasses, 1 pt.; water, 3 gal.

"The solution was prepared by stirring the molasses in three gallons of water until all of the molasses on the bottom of the pail was dissolved. The potassium arsenate was first dissolved in about a quart of boiling water and then added to the diluted molasses. The poisoned bait was thoroughly agitated by pumping the liquid back upon itself with a spray pump.

"In 1915, during a very rainy season, the results obtained with three applications of the poisoned bait spray containing a soluble poison dissolved in diluted molasses showed that the infestation varied from 0 to 20 per cent in orchards situated away from the margin of the experimental area, and from 32 to 57 per cent in orchards near untreated trees.

"An even distribution of the droplets over the foliage is more effective than spraying the trunk, large limbs, and foliage of the lower branches. The number of applications necessary to insure good results canot be stated with this work still in its experimental stage. In orchards where tent-caterpillars have practically stripped or partially defoliated the trees the poisoned bait with the use of a soluble poison cannot be advocated. In orchards where tent-caterpillars are controlled, defoliation caused by spray injury is far less than the damage caused by these pests in neglected orchards. Our experience shows that after fruit growers have been convinced of the results obtained by the use of the poisoned bait spray many prefer sound fruit even if burned foliage is the necessary price.

"The fruit fly remedy has been a complete failure in the control of the pest under town conditions. With four applications of the spray the infestation varied from 4 to 98 per cent."

It will thus be seen that under town conditions, or in non-isolated orchards where flies can readily go from one group of trees to another, it was found to be of no use to apply the poisoned spray with a view to controlling the apple fruit fly.

Results, however, with an isolated orchard indicated that there may be hope of getting the maggot free apples by the application of spray baits to kill the adult flies. These records are published now, although they rest upon an experimental foundation of but two seasons' work, in order to serve as a suggestion to owners of isolated orchards desiring to combat the apple maggot with sprays. No one should undertake to use the formula indicated without realizing that it is sure to injure his foliage. In this connection emphasis might be laid on the point, however, that since this spray is a lure to the flies because of the sweet contained, it s not necessary to cover the foliage in the thorough manner required when making applications for leaf feeding insect pests or fungous diseases, and that protection for the fruit may perhaps be gained by sacrificing the leaves on only a few branches.—Chas. D. Woods, Director Maine Agricultural Station.

THE strongest words of commendation for the Alpha Gas Engine come from the men who use this engine. In the long, economical and reliable service the Alpha gives they have positive proof of its value and they never hesitate to assure their friends of the wisdom of buying an Alpha.

Possibly you can buy an engine for less money than you can an Alpha, but you cannot buy an equal amount of good service in any other engine for so little money. In the Alpha you get more years of service, the lowest fuel cost, exceptional freedom from the need of repairs and the easiest engine to operate and care for.

The Alpha is a simple engine, with plenty of power, perfectly controlled by a governor that keeps it running steadily and smoothly under light, heavy or varying loads. This engine has no complicated, delicate parts to require constant attention—not even batteries. It starts and operates on a simple low speed magneto. You can use either kerosene or gasoline for fuel.

You need a gas engine on your farm. Buy an Alpha now. That is the quickest and best way to save the money that is to pay for the engine. Ask for a copy of the Alpha Engine catalogue.

Made in eleven sizes, 2 to 28 H. P. Each furnished in stationary, semi-portable, or portable style, and with hopper or tank cooled cylinder.

MOVING THE GROWING TREE

Aren't there some promising saplings wasting their good looks in your woodlot that you can find time to dig this summer and plant near the house? Have you an old shade tree that is getting ready to die, or a bald spot in the yard with no tree at all? Put in a little one, and you'll find it pays, not only in beauty and sentiment, but in comfort in future dog days, and in the salability of your place if you ever want to sell. The job can be fitted in before the rush of harvesting.

In moving a tree, first dig out a circle as near the size of the crown of the tree as possible, making sure to get all the roots. Leave the sod on; it holds the soil together. Cut all the broken roots off smooth.

In setting, have the hole deeper than the roots will reach, which insures them a soft place to start. Spread the roots naturally and sift in rich surface soil. The tree must be set no deeper than it stood naturally; this is so important that one person had better hold the tree up while another shovels.

Water the tree if it is planted in its growing season; otherwise not. Heap a mound of dry soil around the base and keep this stirred to prevent caking. Don't let sod form near the tree at first. The best time to transplant is just before growth starts, though the fall or late spring will do. Pick a cloudy day for the work. Prune the top according to the amount you cut off the roots.

Wilkinson Plows

THE oldest line of steel beam plows in the Dominion, made in the old Wilkinson Plow Co's factory, by old Wilkinson Plow Co. experts—every one of them men who know their business. It is **the standard line of plows** and includes 25 or more styles to choose from. U. S. S. Soft Center Steel Moldboards, highly tempered and **guaranteed** to clean in any soil. Steel beams, steel landsides and high carbon steel coulter. Clevises can be used either stiff or swing. Each plow is fitted especially with its own pair of handles—rock elm, long and heavy and thoroughly braced. The long body makes it a very steady running plow. Shares of all widths — specials for stony or clay land.

General purpose, light, medium, and heavy, side hill, sod, drill or one horse plows

The plow shown turns a beautiful furrow, with minimum draft and narrow furrow at finish. *Ask for new booklet.*

Repairs for all Wilkinson Plows

CONTROL OF APPLE BLOTCH

Along with other more or less known diseases of the apple is the blotch, which winters over in the form of a canker which fastens itself onto a twig or watershoot, preferably the latter, and ripens its spores the following season, spreading to both fruit and twig growth. The spores are spread by rains and heavy dew, as the worst infected fruits will be found directly underneath the cankered limbs or twigs, topmost fruit in many cases being entirely free from the infection. Rainy seasons are the worst for blotch and there is practically no blotch infected fruit in extremely dry seasons.

The blotch on the fruit first appears as a minute brown speck on the skin, enlarging rapidly as the season advances, and often covers one-fourth of the fruit's surface by gathering time. In many cases these brown spots crack open, making the fruit subject to the innumerable rot spores that abound everywhere. When once under the skin of the fruit, blotch cannot be cured or even remedied; therefore it is very advisable to catch the disease in ample time.

Repeated experiments have shown conclusively that lime-sulphur solution will not control blotch, and further that bordeaux mixture completely controls the disease. As arsenate of lead can also be used with the bordeaux mixture we have the complete mixture for the combat of blotch and numerous other fungous diseases, as well as the poison to control insects.

The blotch begins to make its first appearance during the first days of July; consequently it is well to make the first spraying, which may follow your earlier lime-sulphur-arsenate sprayings, about June 20 to 25. If the weather is rainy, follow with a similar spraying in a week; if dry, it may be delayed 10 to 12 days with safety. A third spraying should follow after about the same period of time has elapsed, and in case the season is rainy it may be well to make even a fourth spraying.

Bitter rot may be controlled by the same sprayings. Careful pruning will remove many of the cankers which can be burned, ridding the orchard of so much of the infection. I consider blotch a worse disease than San Jose scale.—Omer R. Abraham.

WASPS THAT ATTACK FRUIT

The wasps known as hornets and yellow jackets do considerable harm to ripening fruit by eating through the skin in order to suck out the fruit juices. Much of this harm is attributed to bees, but in almost all cases when bees are feeding on the exuding juices they are frequenting holes made by other insects.

These wasps nest in the ground or in old trees. If the nest can be discovered, which usually means watching the insects when they fly home, the entire colony can be quickly exterminated. A gallon jug, quarter full of water, and placed next to the nest is all that is needed. A wasp will emerge from the nest opening, perceive the jug, and fly angrily at it. The hollow sound of its buzzing, echoing from the jug, will make it enter, when it falls into the water.

Wasps are able to communicate with each other, and the imprisoned wasp possibly calls to its sisters. At any rate, the colony, one by one, in the course of the day, will find its way into the jug. This system is perhaps easier than the distribution of poison on food for the wasps. If the latter method should be tried a little paris green or white arsenic may be distributed on minced meat and scattered where the wasps will find it.—Dr. A. L. Melander.

Sign no purchase papers that do not bear the Guaranty Emblem

Now You Can Buy Your Favourite Automobile On Standardized Time Payments

AT the request of the leading manufacturers and dealers of the Dominion, the Guaranty Securities Corporation has established its Canadian office in the National Trust Building, Montreal.

The Guaranty Plan provides a private, dignified and standardized system of credit, fully safeguarding the banking proprieties, and offers unusually liberal accommodation to responsible and worthy farmers and others engaged in agricultural pursuits, who can afford to own and maintain cars, but desire credit in their purchases.

The Guaranty Plan is free from annoying red tape—a confidential, direct and simple business transaction, giving —*"Time for the Buyer—Cash for the Seller—Safety for All."*

Go to the nearest Dealer in the car in which you are interested. He should be equipped with full instructions and the simple form of purchase contract which you will sign. If, by any chance, he is not in a position to supply you with this information, write us, giving his name and address, and the make of car he handles. Also, ask him to write us without delay. We will see that your requirements are taken care of promptly.

The Guaranty Plan is applicable in the purchase of a number of the best known cars, produced by permanently established concerns who maintain Canadian service organizations adequate to meet the full demands of Canadian owners.

In the list of approved cars you will find one or more that will meet the requirements of your desire as well as your purse.

A description of the Guaranty Plan, and a list of the cars recognized, will be sent upon request, but first call upon the dealer you prefer to buy from.

POTATOES FOR CALVES

J. T. McKim, of Indiana, writing in to Hoard's Dairyman, says: You see I am Irish, and an Irishman usually thinks that potatoes are good for everybody and everythisg that lives. Remembering how my father on the home farm fed potatoes to the pigs and calves and sometimes to the cows, and how my mother and sisters fed them to the chickens, and remembering how fat and sleek all our stock was at all times, I concluded when I began raising calves by hand that I would adopt the same method that brought such good results.

To be sure that I would make no mistake, I tried out the potato diet on some good-for-nothing scrub calves, not caring very much what results I might have. The scrubs seemed to do every bit as well on the potato diet as the better calves did on the whole milk diet. The next season I treated all my calves on the potato diet except one—a bull calf from a high producer that I wanted to make just as good as possible. I took the bull through until weaning time on whole milk of his own mother's production, but I must confess the difference in the potato-fed calves and the whole-milk fed calf was scarcely noticeable in so far as growth and flesh were concerned.

Here is the way I did it: After letting the calves to their dams for two or three days, I took them off the cow, but gave them the whole milk from their mother until the milk was ready for market. Then I fed them one-third whole and two-thirds skim milk for about ten days, and by the fifth day off whole milk I began the potato diet, decreasing the whole milk and increasing the potato.

At potato-digging time I put the culls away carefully, and marketed the top-notchers. When preparing a feed I washed the potatoes as clean as if preparing for table use, boiled them until thoroughly cooked, crushed them until they were a finely pulverized pulp, mixed them with milk, and then passed the whole mess through a wire screen to make sure no lumps would get to the calf's stomach. This latter process also removed the skins. The proportion of feed was at first four ounces of potatoes to the gallon of milk. I watched the calves closely, and if all was going well I would increase the potatoes to six or eight ounces as the case might suggest to me. I kept on increasing every few days until I reached what I considered a full feed, which was seldom over one pound to the gallon. Sometimes when a calf was a great big lusty fellow and seemed to need more feed I would give a little higher per cent of potatoes. I was very careful not to overfeed. My rule was never feed until the calf was bloated and would take no more. Better let him off unsatisfied than to stuff him until his sides pouch out; a whole lot better let him beg for more than to have him turn away in disgust from the milk pail. My experience in calf breeding is that a large majority of our calf troubles come from overfeeding, especially scours.

Always warm the milk and potatoes; never feed it cold. Be very sure to never feed when sour. When it is sour feed it to the pigs; it will do them good. When the weather is cool I cook enough potatoes to last three or four days; when warm enough to sour quickly, cook every day. When we make cheese, which we do sometimes, we feed the whey the same way. We never feed less than three times in twenty-four hours, and if we have a bunch of calves we are dead in love with we have fed six and sometimes eight times in twenty-four hours. It takes work—of course it does. Some would say work and trouble. No, not trouble; work and pleasure is the better way to put it. Certainly it is not one-hundredth part as much work as your mother and my mother put on us. See the pleasure they got out of it until we got too big to listen to mother—then some of us were not worth the trouble, were ot worth half as much as the nice, pure-bred Guernsey calf.

Admonition: If you don't know about this kind of feed, try it out on a two-dollar scrub calf. The same kind of feed is very fine for pigs and chickens. Try it.

* * *

Have any of our farmer-readers tried this method?

CLEANING THE MILK THINGS

Milk utensils should first be rinsed with cold water to remove all particles of milk, then thoroughly scrubbed with a brush in warm water to which a little good washing powder has been added. They then should be steamed, or at least rinsed in boiling water. No wiping clothing should come in contact with them after scalding. When possible, all utensils should be placed in good sunlight and pure air.

The separator, of course, must also be cleaned thoroughly. No one should place any confidence in the claim that separators wash themselves by simply running water through them. Washing a separator is not a difficult task if done soon after separating. The water for washing should be warm, but not hot enough to cook the curd.

If it is not convenient to wash the machine immediately after separating, the bowl should at least be taken apart and immersed in water. This will loosen all the curd and make washing comparatively easy. If the parts are scalded with hot water or steam after washing and left in a sweet, clean place to dry, no wiping with a cloth is necessary.

The best milk pail is the one so constructed that the least possible amount of dirt falls into it. The small top pail may have some objections, but its advantages are so evident that it rapidly is being adopted by our best dairymen.

All milk utensils should be heavily tinned and as free from seams as possible. Crevices and seams should be flushed full and smooth with solder. If pails of this kind cannot be purchased, take your pails to a local tinner and have him fill up all crevices with solder. Wooden pails readily absorb milk particles, making it almost impossible to keep them sweet and clean, and for this reason they should have no place in the dairy.—J. H. Frandsen, Nebraska Agricultural College.

"NATIONAL" Separator Owners

NOTICE!

AS SUCCESSORS of the Raymond Manufacturing Company, Limited, of Guelph, Ont., it is absolutely necessary for us to revise the list of names and addresses of all owners of "National" Separators. This will enable us to give prompt service and attention in supplying parts for the "National" Separator—a machine that in the last twenty years has given remarkable satisfaction. We are anxious that the change of ownership should ensure full protection of the interest of every Owner of a "NATIONAL" SEPARATOR.

It is in your own interests, then, that we ask you to mail the coupon, properly filled out, TO-DAY. We will gladly send you the new book on "Superior" Separator facts, showing the improvements we have made in the new machine we now offer under the name of

"Superior" Separators

The ball-and-socket spindle, ensuring an absolutely self-balancing bowl, is but one of the new and exclusive features which place the "SUPERIOR" in the very front rank of cream separators. Even if you are not a "National" owner, mail the coupon to-day for the booklet.

Amatite Roofing

NEEDS NO PAINTING

Amatite stands alone in the ready roofing world. It is the one roofing you don't have to paint. Once laid, it will last for years without any attention from you. For sidings and steep roofs it is supreme. If you could only see how it is made—see the tough, fibrous felt, the dense, non-volatile saturating compound that keeps it water-tight, you would understand our claims. Try some.

A Roofing Triumph

The durability of Amatite is only one of its fine points. The same structural feature which makes it unnecessary to paint Amatite, gives it a distinctive and beautiful appearance. We refer to its sparkling, mineral surface. Improves the appearance of any building. The best buy in the ready roofing market.

NOVA SCOTIA CREAMERIES

The co-operative creameries in Nova Scotia are again showing a decided increase in business over former years. It is estimated that the make up to the present time is about 35 per cent ahead of this time last year.

Pastures generally over the province are good, with possibly some exceptions in Cape Breton, where the season so far has been very dry.

One new creamery has been opened this year at Margaree Forks, C. B. The make there for May was very satisfactory. Another new creamery will open at Lower South River, Antigonish County, shortly.

Creamery picnics were held over the province as follows: July 1st, Cumberland Co-operative Creamery Co., Ltd., at River Hebert; July 4th, LaHave Creamery Co., Ltd., at Bridgewater; July 6th, Milburn Creamery Co., Ltd., at Calignant Cove; July 7th, Scotsburn Creamery Co., Ltd., at Scotsburn; July 11th, Margaree Creamery, at Margaree Forks.

These picnics were addressed by Mr. George H. Barr, chief of the Dairy Division, and Mr. Harvey Mitchell, the Maritime representative of the Dairy Division, Ottawa, and also by Prof. Cumming and other members of the Nova Scotia Department of Agriculture.

A picnic was also held by the Intercolonial Creamery Co. at Lower South River on July 1st, addressed by Mr. D. W. Murray, president of the Nova Scotia Dairymen's Association, and by Prof. Trueman, from Truro.

TIMING SEPARATOR SPEED

Too low speed of the separator means loss of cream. Experiment station figures indicate that a large per cent of separator users turn their machine too slowly. The proper speed of a cream separator is indicated on the crank handle, and varies from 40 to 60 turns a minute. A uniform rate of turning yields a uniform grade of cream.

An operator can with practice so time the speed as to keep it practically uniform. Low speed means loss of cream. The probabilities are that the average operator of a cream separator could well afford to put on a speed indicator so as to be sure of running the machine at the right speed.

FULL FEED ON APPLES

Occasionally one of our cows has got into the orchard and eaten enough apples to make her seriously sick and almost completely stop the milk flow. To guard against this I now give them a few apples every day as soon as the apples are two-thirds grown, gradually increasing the quantity until each cow gets a peck twice a day.

We raise a great many apples and have these to spare. By this method there seems to be no danger from overeating, even if they get into the orchard and eat all they want. We practiced this plan for several years with no bad results. It doesn't hurt the cows, and it helps out a lot when feed and pastures get short in the fall. —W. F. Heath.

Machine Saves Time.—The average time required to milk a cow by hand, weigh and take care of the milk, etc., is seven minutes. The average time required to milk a cow with machine, weigh and take care of the milk, etc., is four minutes.

Just as soon allow a man to strike one of the family as one of the cows. Let your milkers know that if they get mad and hit a cow you are apt to get mad and strike them. Then they'll remember.

You need a new
DE LAVAL
SEPARATOR
NOW

1st If you are still using some gravity or setting process of creaming—

BECAUSE YOUR WASTE IS greatest and quality of product poorest in mid-summer when the milk supply is heaviest.

BECAUSE TIME IS OF GREATest value on the farm at this season and the time and labor saving of the good separator counts for most.

BECAUSE THE SKIM-MILK IS poorest without a separator in hot weather and often more harmful than helpful to calves.

BECAUSE THE WORK OF AN improved De Laval Cream Separator is as perfect and its product as superior with one kind of weather as with another.

2nd If you have a very old De Laval or an inferior separator of any kind—

BECAUSE THE LOSSES OF the poor separator from incomplete skimming and the tainted product of the hard-to-clean and insanitary separator are greatest at this season.

BECAUSE OF THE GREAT economy of time at this season in having a separator of ample capacity to do the work so much more quickly.

BECAUSE AN IMPROVED DE Laval is so much simpler and more easily handled and cared for than any other, and you cannot afford to waste time these busy days "fussing" with a machine that ought to have been thrown on the junk pile long ago.

BECAUSE THE DE LAVAL Separator of today is just as superior to other separators as the best of other separators to gravity setting, and every feature of De Laval superiority counts for most during the hot summer months.

These are all facts every De Laval local agent is glad of the opportunity to prove to any prospective buyer. If you don't know the nearest De Laval agency simply write the nearest main office as below.

DIARRHOEAL DISEASES OF CALVES

Austin Peters, M. R. C. V. S., Harvard, Mass., has this to say, in Guernsey Breeders' Journal, of one of the greatest troubles that stock breeders are called upon to contend with:

Some writers classify diarrhoea in calves under but two heads: that is, sporadic diarrhoea and infectious diarrhoea or dysentery, the germs of which may gain entrance to the animal anatomy through the fresh umbilicus or through other natural channels of infection.

The symptoms of sporadic diarrhoea are looseness of the bowels, with perhaps bloating, colicy pains and loss of appetite; the calf may be feverish, the mouth pasty, nose hot and dry; in some cases the disease may be ushered in with a chill. Fhe faeces at first may be thick and pasty, of normal color and smell, later becoming more watery and light colored, frequently expelled in jets, and finally becoming greasy yellow or dull green, frothy, sour smelling, or of a very offensive odor, and may contain flakes of undigested curd, or may be streaked with blood. The discharges become very irritating, scalding the skin below the anus and under the tail, causing the hair to fall off.

Sporadic diarrhoea may appear when the calf is a week or two old, or later when a month or six weeks of age.

Causes

There are numerous causes for this form of disease. It may be brought on by attempting to wean too early, giving dry food of a coarse, fibrous or irritating character before the digestive organs are sufficiently developed to receive such material, or from mouldy forage.

Improper milk substitutes may be another cause, especially if too rich in starch, or given in too large quantities at first.

Sudden chills may cause diarrhoea in young calves; a sudden cold snap in winter may cause calves to scour.

Overfeeding at too long intervals is another cause; it is better to feed the calf three times a day on a moderate quantity of food than to allow it to gorge itself morning and night, as is sometimes done.

Dirty vessels or milk that has been kept too long, or that is too cold at the time it is feed, may all be causes, as well as improper milk, such as milk from a cow with mammitis, or from a cow giving milk too rich in fat, or fat of an indigestible character. Sometimes food of an improper character, or medicines given to the mother, may affect her milk and render it indigestible, or even undue excitement or fatigue may influence the lacteal secretion.

These various causes may lead to the development of bacteria in the digestive canal of the calf that are not of themselves injurious in small numbers, or that have no influence on older cattle, which result in indigestion, bloating, and diarrhoea.

Treatment of sporadic diarrhoea if adopted early is usually satisfactory. In the first place, try to avoid the disease by feeding regularly at not too great intervals, taking care not to overfeed, to furnish proper food under cleanly conditions. These precautions are usually sufficient to prevent the appearance of the malady.

If a calf should develop sporadic diarrhoea, curative treatment has every chance of succeeding if undertaken in time.

Simple treatment if adopted early is sufficient; reduce the quantity of food, scald the milk, and add lime water to it, also a little bicarbonate of soda. A teaspoonful of powdered cinnamon and a teaspoonful of powdered ginger in the food is excellent, in addition to the lime water and bicarbonate of soda. If the calf has been used to having calf meal in its food, a small quantity of this will sufficiently disguise the taste of the cinnamon and ginger so that they will be readily taken if the little animal has not gone completely off its feed. If diarrhoea is due to milk too rich in fat, skim milk or milk from another cow may be substituted.

In disturbances of the digestive organs it is often advisable to give a mild purgative at the outset of the disease in order to quickly remove any irritating or indigestible material that may be making trouble. For this purpose, two or three ounces of castor oil will prove effective, or a small dose of either Glauber's or epsom salts.

In more severe attacks, where there is loss of appetite, it may be necessary to bottle medicine into the calf; in such cases, more powerful drugs may have to be employed, such as laudanum, ten to twelve drops in a little rice water two or three times a day, of subnitrate of bismuth, in doses of twenty to thirty grains two or three times daily. In some cases intestinal antiseptic such as salol or calicylate of soda will prove useful. In cases where the calf is very weak it may be necessary to keep up its strength by means of stimulants; for this purpose brandy is one of the best, given in small doses of from one-fourth to one-half ounce in a little warm water every three or four hours.

If there is much tympany in a sudden attack of acute indigestion, two or three teaspoonfuls of aromatic spirits of ammonia in three or four ounces of water will relieve the bloat, and is an excellent stimulant. This should be given in cool water; if given in warm water the ammonia starts to evaporate and causes the calf to gag, in which case the medicine might go the wrong way, enter the windpipe, and produce mechanical pneumonia. In fact, in giving bulky medicines of any kind to animals, they should be administered very slowly and carefully in order to avoid this accident.

Off for an Afternoon's Sport

Barrett Made in Canada

Money Savers for Farmers

DON'T eat more dinner than you can hold simply because the cook has prepared more than you can eat. If you do, you'll probably have "inside information" that things are not quite right. By the same token, don't buy something that you don't need merely because it's cheap. If Robinson Crusoe had paid one cent for a postage stamp he would have been a spendthrift.

But, when you find things that have an every-day need, selling at moderate prices, then is your time to *economize by buying*. Such products will save you money. We make such commodities. This page describes seven of them. Sold by good dealers everywhere.

Everjet Elastic Paint

We have a product called Everjet Elastic Paint that will save you many a dollar every year. It is a wonderful roof paint. Applied to ready roofings, it adds years to their life, makes them leak-proof and improves their appearance. Everjet is invaluable for farm implements. Protects them from rust and keeps them new. It never peels, scales or cracks. The best carbon paint made. Good wherever you have exposed surfaces. Try a can.

Everlastic Roofing

Insurance against wind, weather and water can be had very cheaply by laying Everlastic Roofing wherever you have a slanting roof. The best "Rubber Roofing" on the market at the price. It is easy to lay, costs little and gives satisfaction for years. Just the thing for barns, outbuildings and poultry houses. Comes in rolls of 1, 2 or 3 ply weight, each roll 36 inches wide. You could pay twice as much and not get as good.

Carbonol, Disinfectant and Deodorant

The most necessary thing you could have around the house is a bottle of Carbonol. It is the best disinfectant, healer and cleanser ever made. Removes grease, germs and odors. Therefore, put some in the water with which you clean house. Heals cuts and wounds; prevents blood poisoning. Wonderful in the sick room because it prevents contagion. It will keep your stable and hen house clean, and drive flies away from garbage pails and cattle pens. The best thing you could have for a hundred different uses. Get a bottle today.

Creonoid, Lice Destroyer and Cow Spray

One of the little things so often overlooked is the relation between contented live stock and profits. Best results cannot be secured if your live stock is infested or worried by flies. Spray your horses, cows, pig-pens and hen houses lightly with Creonoid. It positively and permanently destroys vermin and lice. Keeps flies away. Makes healthy porkers, happy cows, good tempered horses. More flesh from your live stock. More eggs from your hens. More milk from your cows. Follow directions carefully.

Amatite Roofing.

Amatite Roofing is distinctive for two reasons—its bright attractive, sparkling appearance and its great durability. It has wide fame, too, as the roofing that needs no paint. Its mineral surface is waterproof and fire resisting. Amatite is made in rolls, each roll containing enough to cover 100 square feet with a 3 inch lap.

Barrett's Grade One Liquid Creosote Oil

The best fence post made will rot if not protected with a good preservative. You can make an ordinarily good fence post last 20 years by using Barrett's Grade One Creosote Oil. It is the best wood preservative on the market. Penetrates deeper than any other Creosote product. Hence it accomplishes more. We can show you tests to prove this. Save the expense of timber renewals. It's a big item. Wherever you have wood exposed to moisture or earth, preserve it with Barrett's Grade One Creosote Oil.

Elastigum Waterproof Cement

Many a farmer or house owner has saved the day, by having Elastigum handy. This tough, elastic, adhesive cement is a wonder for those quick repairs that are daily coming up. And it makes those repairs permanent. If you have a leak to fix, a joint to seal, use Elastigum. Unexcelled for joining or relining gutters of wood or metal, and for flashings around chimneys. Elastigum is a real "handy man" and you ought to have it on hand. Good for a hundred uses.

CUTTING OFF BOAR'S TUSKS

When the tusks get so long that it is dangerous to handle the boar they should be cut off. Slip a running loop over the boar's nose and let it catch behind the tusks of the upper jaw. With this hold it is possible to snub the hog to a post and hold him. The tusks can be cut off by gripping them tightly with a pair of pincers that are strongly built and tapping the back of the pincers with a hammer. It is surprising how easily the tusks will drop off. They may also be sawed off close to the jaw.

PILES CURED at HOME by NEW Absorption Method

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers. Box P. 309 Windsor, Ont.

STANDARDS ARE FIXED IN THE BUSINESS WORLD

You must be governed by them and set yourself in tune with them. Of what avail is it for you to go to the business man and say, "I am willing to learn, if you will give me a chance," if the business man has standardized the requirements of his employees, in the interests of his business? The business man has no personal feeling in the matter. He might even prefer you for some reason. But to guarantee the success of his business he must kindly and firmly turn down your application.

KEEPING THE PIGS FREE FROM WORMS

We get a good many requests for advice on ridding swine of worms. On the general subject of prevention Prof. John M. Evvard, of Ames, recommends the following:

1. The pigs should be "kept coming." The better the pigs are handled and fed the more likely they are to avoid and throw off infection. Give the young pig a good start. Old hogs do not apparently suffer much from worms generally, but even the old hogs should be well fed and carefully managed so as to keep them in good thrifty condition.

2. Good feeding of the young pigs may be accompanied by arranging creeps, placing in them such feeds as corn, tankage, wheat middlings—each in separate feeders. If these pigs are out on pasture so much the better, preferably alfalfa or clover. A little milk is a great help.

3. Free access to condiments such as air-slacked lime, charcoal, slacked coal, powdered sulphur, copperas, sodium sulphate, and Glauber's Salts, sal soda, and salt may be given—these being allowed "free-choice" style—each placed in a separate feeder. They will help some, but are not a sure prevention by any means.

4. Clean pastures and exercise grounds are important. Pastures of the annual sort, such as rape, are fine, although good clean alfalfa and clover pastures—pastures that the hogs have not run on before—are excellent. Plowing the lots helps wonderfully in getting rid of the infection. Taking the pigs away from the old infected lots and putting them on new pasture and in new lots is to be recommended. Keep the hogs away from the white grubs or the snails along the river bank so that they will not get the embyros of the thorn-headed worm. In other words, keep away from infected places. Be careful of the hog wallow. See that the water supply comes from a deep well rather than from the contaminated leachings of the barnyard where the hogs are kept.

5. Do not throw the feed out in the mud or in the infected lots. Have a concrete platform and feed there. Keep this platform clean, so that the pigs will pick up a minimum of infection. Keep troughs and the natural feeding places free from cobs, refuse, etc.

6. Drainage is necessary. Keep the lots as dry as possible. The lung worm infection is likely to be very severe in wet years; this is likewise true of other kinds of worms, such as th round worm and the kidney worm.

7. The life history of the worm should be studied. That is, of the thorn-headed, of the round, of the lung, and of the kidney, and schemes provided that will evade the worm as well as the worm eggs and the embryos at all stages in the life history of said worm.

8. Use santonin and calomel to rid the hogs of worms. The dose is about five grains of each to a 100-pound pig. For a 200-pound pig increase to seven and one-half; for a 300-pound pig to about 10 grains of each. That is called the "emergency treatment," and may be practiced on wormy pigs to advantage.

Immature or bob veal, when properly prepared, is fit for human food, especially when its deficiencies in fat and possibly in small amounts of undetermined constituents are counterbalanced in the ordinary mixed diet. This sums up the government's research work with the flesh of calves slaughtered at three weeks of age or less.

Tom—You're not turning as fast as Dad does, Mary.
Mary—No Tom, but we'll get all the cream any way with this lovely new machine. Dad says

"It Skims Clean at Any Speed"

That's what this marvelous new invention actually does.

A fixed-feed separator may skim clean if in perfect order and turned at just the ***right speed.*** But every member of the family turns the crank at a ***different rate;*** no one can maintain an even speed ***all the time***—it isn't human nature. Every old type separator has an ***unchanging inflow*** of milk. That's why it loses cream when not turned at exactly the right speed.

THE NEW
SHARPLES
SUCTION-FEED

Separator gets all the cream because it automatically regulates the inflow exactly in proportion to the separating force—always just right for perfect skimming.

The Suction-feed Separator delivers smooth cream of ***even thickness*** that churns out more butter of choicest quality. If you sell cream you can ***guarantee uniform density.***

You can increase the capacity of the Suction-feed by simply turning faster, and get through quicker if in a hurry. The new Sharples is the only Separator that can be hastened. You can easily pour milk from a forty-quart can into the low supply can. It's the largest found on any separator—and it's only knee-high.

The women folks prefer the Sharples because the simple tubular bowl is so easily cleaned. Has only three pieces—no disks to wash or to get mixed up. The tubular shape gives double skimming force.

The new Sharples is ruggedly built for hard service. It is neat, compact, runs easily and oils itself.

This wonderful machine will earn you a new dairy profit—without added expense. Our new free book, ***"Velvet" for Dairymen,*** fully describes the Suction-feed. Your copy is ready. Send for it today. Address Dept. 79

Had Weak Back and Kidneys.

COULD HARDLY MOVE IN BED.

When the back becomes weak and starts to ache and pain it is a sure sign that the kidneys are not performing their functions properly.

On the first sign of backache Doan's Kidney Pills should be taken and serious kidney troubles prevented.

Mr. Francis McInnes, Woodbine, N.S., writes: "I deem it my duty to let you know the wonderful results I have received from the use of Doan's Kidney Pills. For a long time I had been suffering from weak back and kidneys. I used to suffer the most at night, and some times could hardly move in bed with the pain. I could do no hard labor on account of my back. A friend advised me to give Doan's Kidney Pills a trial, and I am glad I did for the pain in my kidneys is gone; my back is strong, and I can perform any hard labor and get my good night's sleep. I only used three boxes of the pills."

Doan's Kidney Pills are 50 cents per box, or 3 boxes for $1.25; at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering direct specify "Doan's."

THE HORSE

REGARDING THE HORSE'S FEET

We should see that our horses' feet and legs are kept clean enough to prevent the possibility of any disease, such as thrush, grease heel, etc., which is often caused by allowing the horse to stand on an accumulation of fermenting manure, or wallow in a muddy yard that contains more or less manure. The feet of the growing colt should especially be watched, and if they do not wear evenly the elongated portions should be pinched off. Allowing the feet to grow out of shape causes uneven pressure on the joints and parts above, and has a tendency to develop ringbone, spavins, and sidebones.

Shoeing the Horse

As the horse grows to maturity and is put to work, it often becomes necessary to shoe him. There is, however, a very large proportion of our farm horses to which shoes are by no means of habitual necessity. The nature of the work, the pace at which they are required to perform it, and the character of the ground over which they ordinarily move, all unite to render artificial protection of the feet, save in exceptional cases, altogether unnecessary.

Unnecessary Shoeing

When this is true, and when it is conceded that shoeing is, even under the most favorable circumstances, an evil, a frequent source of disease, and therefore a direct source of loss, it is a matter of deep regret that such a large majority of our farm horses should be needlessly subjected to a mutilation which shortens the efficiency and too often renders their life, thus shortened, one long continued agony, for it must be borne in mind that our ordinary village blacksmith is not always the most competent of workmen.

Marring or Protecting

Without wishing to do any injustice to our knights of the anvil, it is nevertheless a lamentable truth that these wielders of the rasp and knife are so wedded to a number of traditional practices so heinous, so irrational, so prejudicial to the interests of the horse that one might wonder whether their mission were not to mar instead of protect the foot. Ignorant alike of the anatomy, physiology, and relations of the different parts, they mutilate, they cut and carve as whim, prejudice or time-honored custom indicates.

Errors in Horseshoeing

Foremost among them is the insane habit of trimming the frog and thinning out the sole till it visibly yields to the pressure of the operator's thumbs. The frog is nature's cushion; by its elasticity it wards off concussion from the less elastic portions of the foot. Only the ragged portions of the frog should be trimmed out. The frog should be left in such shape that it will fulfil the mission which nature intended for it. The farrier, having destroyed the frog, next turns his attention to the sole, which, by all traditions of his craft, must be pared down until only a thin film of soft, partially formed hoof is left to protect the living structure within against bruises and injury. Nor does the mischief stop here. The sole itself, or what is left of it, consists of soft, moist, half-formed horn, which dries and shrinks on exposure to the air, and thereby entails a further and a still more serious injury to the foot.

Pare Sparingly

Only the loose portions of the sole should be removed. The horse grows new soles to his feet just the same as he grows new hair, and when portions of this sole become loosened and ragged they should be removed, but the new firm sole should not be pared down. After the shoe is nailed on, the ordinary farrier has enough pride in his work to want to make his job look neat, so he rasps down the foot, and, to give it a few finishing touches, he rasps off the outer hard, smooth layer of natural varnish which is intended to retain the moisture in the foot. There are other specific objects in shoeing than to protect the foot, but it is not my purpose to discuss them, as they belong more properly to the veterinarian.

Supervise the Work

We believe farmers should give the matter of the shoeing of their horses more thought, and dictate to their blacksmith how they want their work done. Great good would also come in the protection of our horses if such legislation could be enacted as would require the ordinary blacksmith to know and understand something of the structure, anatomy, physiology, and functions of the different parts of our horses' feet and legs.

In the meantime, let us look well to the quality of feet and legs we are breeding in our horses, and the care we give them that we may not have ourselves to blame for any shortcomings in our horses and the profit we gain in the rearing of them.

HOW TO SAVE TIME IN HARNESSING HORSES

Harnessing horses is a very simple thing, one might think. Yet there is usually a right and a wrong way and a slow and fast way to do most work. Naturally having so much hired help about us, we have often been disgusted to see how carelessly some things can be done, and a mixed up set of harness is very aggravating. We use mostly the common trace chain harness, and at the rear of the stable, about 6 feet from the cement floor, we have hard wood pins, about 16 inches in length, inserted in a 4x5 piece nailed to the post. We have our horses trained when they come to the stable to stop at the door before entering to have their bridles removed, and then let them go to their respective stalls. We step inside the door, hank the bridle on the pin, step up to the horse, unfasten the crupper, next the girth, then hames, then place the halter on the horse, so when we remove the harness he cannot back out of the stall. Then we take hold of the hames, slip the harness back on the horse, and grab them in our arms, step to the harness pin, and place them with the hames facing the wall, the back-band following it, and then the hip straps. Return to the horse, remove the collar, and hang on pin over the harness.

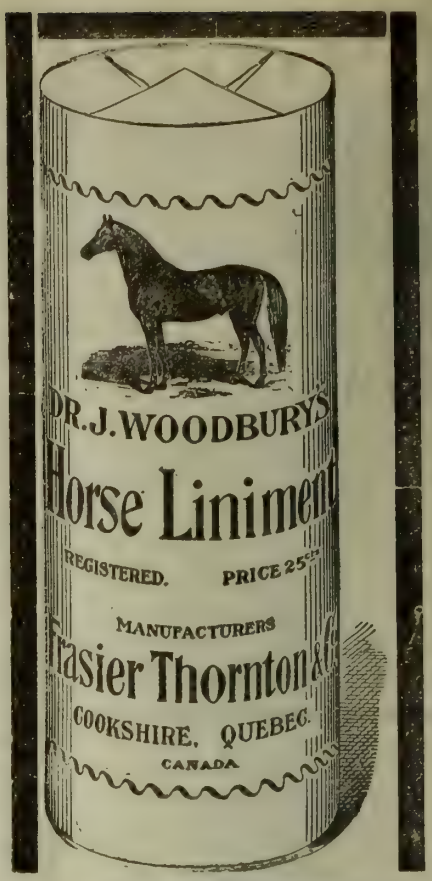
Then when we want to again harness the horse the operation is just reversed. The collar, coming first, goes on first; and then, parting the harness with the arms, seize them, face about, and gently place on the horse's back. The collar is already there in place, so we fasten the hames, then the girth, then the crupper, reach for the bridle, unfasten halter, put on bridle, and you are ready for business. This has become a fixed system with me, and you would be surprised to know how much time is saved where you have to harness a number of horses each morning.

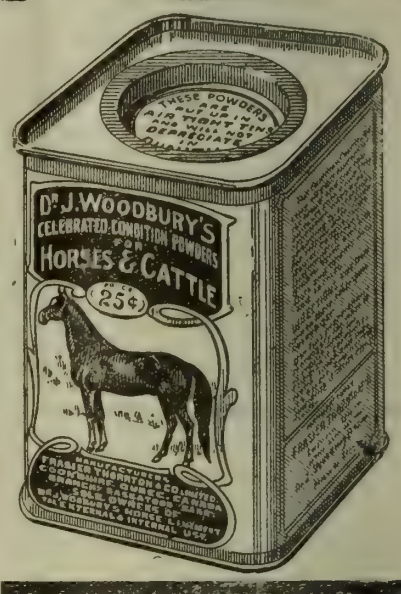
Now, I have seen some people let the horse go direct from the watering to the stall, then go in and unbridle the horse, return and hang it up, then go back to the hames, loose them, remove the collar, return and hang it up, then go back and unfasten the harness, hang them up over the collar, and then return to halter the horse. The result is a great loss of time; besides, your horse may have stepped out of the stall and run to the field. Also, when you want to harness again, your collar is underneath and you have to throw the harness on first and run the chance of the horse slipping them off.—A. V. Priddy.

PREVENT SORE SHOULDERS

The best cure for sore shoulders is prevention. By proper fitting of the collar they can be avoided. Sometimes the shoulders of a fresh horse will scald. I have cured them by bathing with cold water at noon and night, and sprinkling with sulphur after each time. Bathing the shoulders in a solution made by boiling oak bark in soft water will toughten the shoulder and prevent it from scalding.

I raise the collars from the shoulders each time I stop. This allows the shoulder to cool. The best thing I have found for sore shoulders is a mixture composed of two tablespoons sulphur, two tablespoons melted lard, and one teaspoon carbolic acid. Mix and apply the same as any gall cure.—L. Martin.





Doctor Said Sciatica--- Rheumatism---Lumbago

But He Could Not Help Me, and Endorsed the Use of Dr Chase's Kidney-Liver Pills.

Mr. Wm. Parker, 105 Cayuga Street, Brantford, Ont., tells in the following letter of his remarkable experience with Dr. Chase's Kidney-Liver Pills: "My doctor treated me for some time for Sciatica, Rheumatism, Lumbago, but to no purpose, for I had to lay off work. The visiting officer of Sick Benefit called to see me and advised the use of Dr. Chase's Kidney-Liver Pills, stating that he had been cured of the same trouble for their use. I asked the druggist about them and he recommended them highly. Not being satisfied with this, I went back to my doctor, and when he said they were good I began their use. The promptness with which they enlivened the action of the kidneys and bowels was wonderful, and it was not long before I was rid of all my trouble.

"I was so bad that I could only walk by hanging on to a chair or the wall. My wife had to lace my shoes. Only those who have had this ailment can realize the way I suffered. I am writing this letter to let people who have my trouble know of these pills. You are at liberty to use this letter, and if anyone interested will call or write to me I will give every detail."

Write to Mr. Parker, enclosing stamp for reply, and he will verify this statement. He will do this out of the gratitude he feels for his cure and because he realizes how difficult it is to obtain the cure of these dreadfully painful ailments.

There are so many treatments recommended for rheumatism that you naturally doubt them all. Here is an opportunity for you to verify the cure and put this great medicine to the test. It will only cost you a quarter to try Dr. Chase's Kidney-Liver Pills. They get at the very foundation of rheumatism, and by removing the poisons from the system take away the cause of pains and aches.

Dr. Chase's Kidney-Liver Pills, one pill a dose, 25 cents a box, all dealers, or Edmanson, Bates & Co., Limited, Toronto.

KEEP THE BOWELS REGULAR AND AVOID CONSTIPATION.

When the bowels are not kept regular they become clogged up with waste and poisonous matter, causing constipation, biliousness, sick headaches, piles, and all kinds of liver troubles.

Milburn's Laxa-Liver Pills will regulate the bowels so that you may have a free and easy motion every day. One pill every night for thirty days will cure the worst cases of constipation.

Mr. John J. Smith, Elginburg, Ont., writes: "I had been troubled for a great while with constipation, and tried many different remedies which did me no good. I happened to try Milburn's Laxa-Liver Pills, and I have found them most beneficial."

Milburn's Laxa-Liver Pills are 25 cents per vial, or five vials for $1.00; for sale at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

A New Shoe Idea for summer outdoor work

Write for Catalogue

For Farmers, Woodmen, Millmen, Trackmen, Laborers—all who work outdoors.

Palmer's "Moose Head" Brand Summer Packs

Made of our famous Oil-Tanned Skowhegan waterproof leather; they have waterproof sole-leather outsoles and solid insoles. The soles, too, are attached by an improved clincher fastener process. They are staunch, light-weight working shoes for spring, summer and fall. Your dealer will likely have them; if not, write us, giving his name and address.

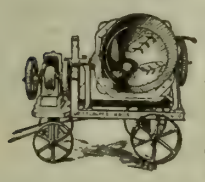
Fredericton, N. B.

Famous Little No. O Power Mixer



Turns out a batch of thoroughly mixed concrete in less than one minute. Discharges from either side, which other mixers do not do. Also mixes your lime and cement mortar to perfection. Light, durable, highly guaranteed, and has a big reputation. Adapted for a hundred different kinds of jobs. A great money saver. Write for our special offer.

WETTLAUFER BROS., Limited
178 E. Spadina Ave., Toronto, Ont.
188 Barrington Street, Halifax, N. S.

POULTRY

BRINGING PULLETS TO MATURITY

To reduce the work of caring for the pullets, we use an inexpensive drinking fountain attached to a large barreled tank which contains enough water for the whole flock for several days and saves the constant attention given to numerous small foundtains. The brooder houses are supplied with slatted doors through which the chicks can pass readily, but which exclude the hens. In each house is placed a generous hopper of grain, another for dry mash, and a smaller one is divided for charcoal and grit.

The hoppers are filled with a grain mixture and mash, and are never allowed to become empty, except when there is a tendency to waste the food. Sometimes the fowls scatter the grain over the floor in hunting for favorite kernels; in that case we leave the hoppers unfilled until they have cleaned up the grain. Once each day they are given a crumbly mash made by wetting the dry mash with sour milk. The sour milk dish is kept full. The method of using a large fountain tank and hoppers reduces the work markedly.

When the brooder houses are opened early in the morning every chick rushes out, and the flock is soon scattered far and wide in search of the proverbally early worm. It is late in the forenoon before they return to their hoppers. After having eaten their evening fill at the hoppers they forage as long as they can see. The fact that seemingly limitless food is always before them does not affect their activity. The pullets eat quite an astonishing amount of food, but show the result by the time they are put into laying quarters in the fall.

The cockerels are separated from the flock as soon as distinguishable, and are confined to quarters to be sold as soon as possible. It is the pullets only which are given free range and the hopper feeding. Our pullets are strong and vigorous, and are laying well by the time they are six months old. Since results are so good, we take kindly to this easy way of breeding them to maturity. When compared to feeding and watering them three times each day, the pullets seem almost to have raised themselves.—A. M. A., in New England Homestead.

SIZE AND SHAPE OF EGGS

The size of the hen has little or no influence on the size of an egg. A four-pound hen may lay the same size egg as an eight-pound hen. The eggs of the different breeds in the national contest in Missouri varied in weight from 2.03 ounces to 2.29 ounces, while the hens themselves averaged in weight from 3.12 pounds to 6.36 pounds. Strange as it may seem, the hens whose eggs averaged 2.03 ounces weighed 5.75 pounds, while the ones whose eggs averaged 2.29 ounces averaged only 3.4 pounds each.

After studying the poultry business from every angle, one recognizes the fact that the size and shape of an egg are the two things all breeders can work for, for they are the only things in common with all breeds and varieties.

An ideal egg should be an oblong oval slightly tapering from one end to the other, and should weigh 2 1-6 ounces, or 26 ounces to the dozen. Egg markets require them to weigh at least 24 ounces. Eggs of this size and shape are the correct size to fill the standard egg case filler, and if incubated will give better results than where various sizes and shapes are incubated together.

The old idea that round eggs hatch pullets and the long eggs hatch cockerels is incorrect, for a hen lays uniformly shaped eggs regularly, which hatch approximately an equal number of cockerels and pullets. Nothing can be told from the size and shape of an egg—whether it is fertile or infertile, or whether it would hatch a cockerel or a pullet; but the shape of an egg is a characteristic which is transmitted to the offspring. Therefore, use as breeders only the hens which produce eggs of correct size and shape. —C. T. Patterson.

TREATMENT OF SCALY LEGS

This common affliction, which is familiar to all poultry keepers, is caused by a minute mite which lives and breeds under the scales of the feet and legs. It is easily recognized in the enlarged, roughened appearance it gives the foot and shank. Each fowl must be treated individually to cure the disease.

In a new book on poultry diseases Dr. Raymond Pearl says one of the very best cures for scaly legs is oil of caraway. This is best applied in an ointment made of one part of oil of caraway to five parts of white vaseline. It is very penetrating, but is not nearly as irritating as some of the commoner treatments more usually advised. The ointment should be rubbed into the leg and foot every few days until all signs of the disease disappear.

AN INDEPENDENCE DAY EVENT THAT TURNED MOURNING INTO REJOICING

By Anna C. Chamberlain

If there was one trait above all others for which Aunt Martha Willets was renowned throughout the neighborhood, it was for her forehandedness. Under her vigorous household regime there was no putting off till tomorrow—indoors, at least—what might be done today.

To easy-going Uncle Ephriam, who preferred the reverse maxim, "Never do today what you might just as well put off till tomorrow," this stern rule sometimes seemed oppressive.

"Ta' ain't a bridge across the Stream o' Time I don't have to cross miles 'fore I come to it, Marthy," he expostulated. "It don't show much trust and confidence in a good Lord to be always preparing ourselves ag'in' a day of trouble. Get my plow and cultivator under cover for fear it might rain? Time enough to get 'em in when it does rain. I'd be ashamed not to trust in Providence a little bit."

So Uncle Ephriam would go his happy-go-lucky way, while his painstaking spouse, her weather eye ever to windward, did her fall cleaning in the dog days, and took other precautions far in advance, for fear she might be hindered when the proper time came.

Knowing this busy forehandedness of her next-door neighbor, Miss Polly Ford, running across lots early on a Fourth of July morning, was not surprised on entering Aunt Martha's sunny kitchen to find the breakfast things all cleared away and the room deserted. Sounds of vigorous movement above stairs indicated the whereabouts of the usual occupants. Doubtless Aunt Martha was making some preliminary movements toward fall cleaning.

With the freedom of a near neighbor and a lifelong acquaintance, Miss Polly stepped into the hall and called. In prompt answer Aunt Martha's large silver-rimmed glasses peered down over the banister.

"Set ye down in the kitchen," called a hospitable voice from behind their shining ovals. "I'll be right down."

"I was a-fixin' to run into town," continued the same voice a moment later, as Aunt Martha arrived breathless by way of the back stairs. "Tim Follet, him that used to own this farm, is aiming to move from his place in the city to the far west. He wrote for that trunk of his grandther's papers we've been a-keepin' for him so long."

"Tim Follet going to move again!" commented Miss Polly, with surprised emphasis, for it was only about twenty years since Tim had moved from their midst into the city. In the minds of settled country folk such restlessness savored of light-minded frivolity.

"So he wrote," returned Aunt Martha. "And I was just a-getting that trunk out of the closet ready to go. If they start Thursday, as they say they're aiming to do, it had ought to get off today to reach them in time."

"Monday, Tuesday, Wednesday," calculated Miss Polly audibly. "That's right, Martha. If them freight companies handle it right, it'll get there. Folks do say they're awful slow. But them express companies is too high to use."

"I've been a-thinking of them things," responded Aunt Martha, "and I've come to the conclusion that I had better go to the city and take the trunk with me for baggage. It won't cost but my ticket, you see, and I could take a look around at the stores and say good-by to Tim's folks all at one expense. 'Pears to me it would be a neighborly thing to do."

"You'll have to get off on the two o'clock train to make the trip and come back this evening," warned Miss Polly, taking her feet off the footstool where she had comfortably settled them. "In that case I'd better not hinder, without I could help some. I can get the setting of eggs I came after some other day."

"If you could," consented Aunt Martha gratefully. "No, I don't need any help, unless if you see Jack Martin you could ask him to stop and carry so late Ephriam thought he couldn't me and the trunk over to the depot right after dinner. I settled on going change his plan about going to the sale. He's buyer for the grange, you know. So he promised to tell Seth Wood, that rents out eighty down below, to drive over for me. But I don't feel no certainty that he'd remember. Men are so terrible uncertain."

"That's so," assented Miss Polly fervently. She spoke from the depths of a knowledge gained second hand from the repeated testimony of many married friends, Miss Polly and her sister having dwelt in an Adamless Eden for more than forty uneventful years. "Like as not if Ephriam did remember, Seth would forget, or come too late for the train."

"So I was fearing," returned Aunt Martha, following her departing visitor to the door, "and for that very reason, when I haw Caspar Ray passing on his way to his lower farm, I went down to the gate and hailed him. As luck would have it, he may have an errand to town right after dinner; but in case he doesn't, he's going to speak to 'Lias Graves and see what he can do; so if none of those others come I might ride over with one of these. It's just as well to have an anchor to windward, you know."

"But you aren't right sure of any one of 'em, are you?" doubted Miss Polly, drawing the strings of her brown chambray sunbonnet close under her chin as she went down the back steps."

"That's the worst of it." Aunt Martha accompanied her informal guest toward the back gate to gain opportunity to further unburden her mind. "That's why I told John Burton about it when he came to borrow our hay fork a little while ago, and he says he's most sure that his father is going to the blacksmith's right after dinner, and he'll ask him to stop in. Still, when I got to thinking about it after he left, it did not give me what you'd call a positive chance, so I hailed Tommy Barker, who was passing on the highway, and told him I'd give him fifty cents if he'd either come himself or find some one else to come and take me over. I guess that's about the best chance I've found yet," concluded Aunt Martha as they reached the gate into the pasture. "Tommy don't come across fifty cents every day."

"That he don't," agreed Miss Polly without reservation; "and he'll be apt to hustle around right lively to find you some one. Shouldn't be surprised if he got you several, if he didn't forget. But, just to be on the safe side, I'll speak to Jack Martin, if you like, and I can find him."

Wth this promise Miss Polly took an affectionate leave of her friend. "In case you get off," she explained; and then speeded away on a longer walk home, around by Jack Martin's, on her errand of friendship and good will.

As ill luck would have it, Jack was not at home.

"There's no telling just where he is," speculated the jaded-looking wife of the good-natured ne'er-do-well. "What with the work he ought to be doing, and the tools he has to borrow to do it with, I never can tell. He may be down to Eby's borrowin' their harrow, or over to Jackson's for the loan of their planter; but he'd admire to take Mis' Willets over to town if he's back in time. In case he shouldn't be, I might speak to Zeke Daniels when he passes on his way home to dinner."

"So do," returned Miss Polly heartily, for Zeke was well known as a generous, kindly man who was ready to help a neighbor at any time. "In case he isn't sure, you might send your little boy down to Williams' to see if Thomas could be spared to do it, and he might see the Jimsons just to make things more certain. Be sure they all understand she must get that 2 o'clock train."

"I won't forget," promised Mrs. Martin. "Betwixt the four them, they'd ought to get it done."

"Surely," agreed the maiden lady; but she was little disturbed at not seeing one of the principals in the part of conveying her friend. Merely leaving word seemed to allow the matter to remain in a state of uncomfortable indecision.

She was vaguely uneasy about her method of executing the important commission confided to her. For that reason she was pleased and relieved when, just before turning into her own gateway, she saw Ebenezer Jordan driving toward her on a brisk trot.

"You're just the person I wanted to see," she called, as he drew near. "Aunt Martha Willets has to go to town today to see Follet's folks off for the west. She wants to take a trunk they left stored in the old house. Uncle Ephriam had to go to the sale today, so she's looking for some one to carry her and the trunk to the train."

"Looks if Ephriam had ought to find time to wait on his own wife," wheezed Ebenezer, holding in his restive team reluctantly. He was afflicted with asthma, and hated to talk when his spells were on.

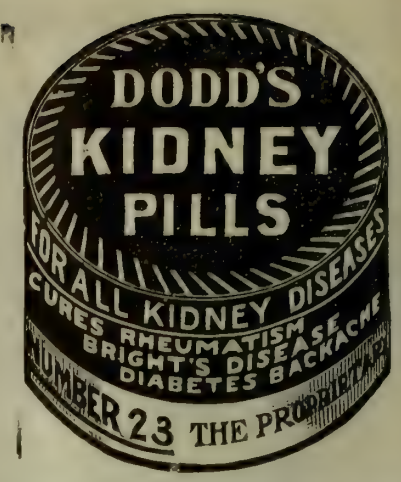
"Does look so," agreed Polly, "but he's gone, and she's wanting somebody to get her over to that two o'clock train. It just struck me that there wasn't a person in this district had such a fine dependable team as you have," concluded Miss Polly, remembering Ebenezer's pride in his horses.

"Course I could," admitted Ebenezer, swallowing the bait, "if I wasn't wheezing; and maybe I won't be if I go right home and take my medicine. I'll hurry along and see," and Ebenezer's buggy whirled on, leaving Miss Polly quite as uncertain as ever.

"Of course they's several that may come," she told her younger and more practical sister Hannah, when she had reached home and laid the perplexing situation before her. "But every last one of them is a man, and you know just how much you can depend on them. Besides, not one of them, so far as I can hear, has bound himself by a full promise. As like as not Martha will be disappointed in spite of the whole bunch of them."

"Unless you was to hitch our Pellipeann to the phaeton and take her yourself," suggested Hannah from the buttery. "Seems as if it would be only Christian like to do it, too. I'd hate to be left to depend on the uncertain mercies of any man."

"I'll do that very thing," declared Miss Polly, losing her look of anxiety on the instant. "I'll feed Pellipeann right away, so's I can get off the first thing after dinner."



"And I'll start dinner real early," returned Hannah. "We can eat about eleven, so as to give you plenty of time to dress and get off by one o'clock."

This arrangement seemed satisfactory to Miss Polly, who proceeded to feed the horse at once, though it was but ten o'clock, and then to begin the various preparations which always seemed a necessary accompaniment to a trip to town.

All this kept both sisters so intent that they took no account of the events which might be taking place in the surrounding neighborhood. It was not till Miss Polly had dressed herself in her second-best suit and hitched their ancient steed to the little phaeton that she felt a reviving interest in matters outside her immediate vicinity.

When she finally clambered into the rickety vehicle, with a mind and vision free to take note of the happenings of the neighborhood, she observed a most extraordinary state of affairs.

She was just reaching to take the lines which Hannah held toward her, when, instead, she gripped her sister's

WOMAN AVOIDS OPERATION

Medicine Which Made Surgeon's Work Unnecessary.

Astoria, N. Y. — "For two years I was feeling ill and took all kinds of tonics. I was getting worse every day. I had chills, my head would ache, I was always tired. I could not walk straight because of the pain in my back and I had pains in my stomach. I went to a doctor and he said I must go under an operation, but I did not go. I read in the paper about Lydia E. Pinkham's Vegetable Compound and told my husband about it. I said 'I know nothing will help me but I will try this.' I found myself improving from the very first bottle, and in two weeks time I was able to sit down and eat a hearty breakfast with my husband, which I had not done for two years. I am now in the best of health and did not have the operation." — Mrs. JOHN A. KOENIG, 502 Flushing Avenue, Astoria, N. Y.

Every one dreads the surgeon's knife and the operating table. Sometimes nothing else will do; but many times doctors say they are necessary when they are not. Letter after letter comes to the Pinkham Laboratory, telling how operations were advised and were not performed; or, if performed, did no good, but Lydia E. Pinkham's Vegetable Compound was used and good health followed.

If you want advice write to Lydia E. Pinkham Medicine Co. (confidential), Lynn, Mass.

For Preserving, Use

LILY WHITE CORN SYRUP

One-third "Lily White" to two-thirds Sugar, by weight.

"Lily White" Corn Syrup prevents fermentation and mold—brings out the natural flavour of fruits and berries—and makes much more delicious Preserves, Jams and Jellies than you can make with all sugar.

In 2, 5, 10 and 20 pound tins —at all dealers.

IF YOU HAVE LIVE STOCK FOR SALE ADVERTISE IN THE MARITIME FARMER.

arm with the strength of amazement and dismay.

"Look! Look yonder, Hannah," she gasped, "and tell me what you make of it."

Hannah looked in the direction indicated, her eyes widening with surprise and fright.

The Ford sisters lived next the corner of section thirty-one on the side next the town. Their house was built on the highest knoll in the vicinity, and commanded a perfect view of the Willets home, which was situated around the next corner on the lower road.

As they looked across upon their neighbor's house from the vantage ground which they occupied, they could see coming to it from all directions teams and teams and teams. There were surreys, phaetons, carryalls, road wagons, and carts.

"What do you suppose has happened?" Miss Polly spoke through white lips, which could barely articulate the words.

Hannah, with blanched cheeks, could scarcely form the reply.

"Accident! seizure!" she mouthed inaudibly, and dinner dishes and household cares forgotten, she rolled her portly form into the phaeton beside her sister.

"She looked all right when I saw her this morning," moaned Miss Polly, pulling hard on the wrong line.

"You never can tell." Hannah took the reins into her own more cap ble hads and turned toward the gate in a wide circle. "In the midst of life we are in death," she continued, when Pellipeann was fairly started toward the gate; "only I hope it ain't that bad."

For the second time that morning Miss Polly seized her sister's arm with a grip of painful intensity.

"Look!" she cried. "Look!"

Ahead of them they saw Ephriam Willets coming down the road, driving at a breakneck pace. Every now and then he leaned forward to urge his already racing team to greater efforts, while his eyes were fixed on the convocation of teams which were gathering toward his home.

As the Ford vehicle turned into the highway his team slackened somewhat to accommodate the amble of Pellipeann.

"Girls," he cried hoarsely "what's happened there?" pointing his whip in the direction of his own home with a hand which shook as with palsy.

"We don't know," returned Hannah, shaking her head to make the denial intelligible above the rattle of the speeding vehicles.

"And I wouldn't stop to take her to town—went to a sale instead." Ephriam's stiff white lips curved to a grin of ghastly sarcasm. Then he lashed his horses to a furious speed, leaving Pellipeann and her burden far behind.

"Land, but he looks terrible!" confided Miss Polly to her sister, not knowing that she spoke in a whisper which the jar of the buggy rendered quite inaudible.

Hannah nodded assent to the words she could not understand, and urged the ancient steed to more strenuous efforts.

By this meas they came in time to the tail end of the seemingly endless stream of vehicles which were winding on toward the Willets residence.

"How'd it happen?" asked the occupant of the first one they reached.

It was Zeke Daniels. He was driving his plow team hitched toa dusty road wagon. Just in front of him Ebenezer's trim Morgans trotted. From Ebenezer's tense attitude and purple ears, it could be seen that he was still wheezing. Beyond him the non-committal backs of the vehicles yielded up no tales of their occupants.

Miss Polly shook her head. It seemed to her that speech was impossible. Hannah answered instead.

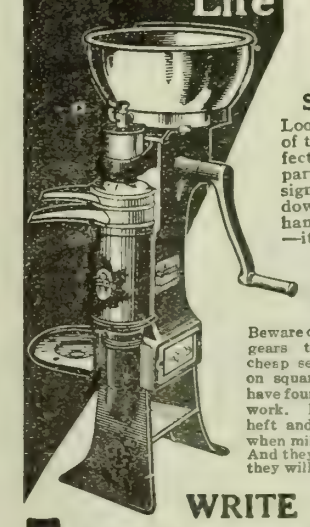
"We don't know any more than you do," she said in a hushed voice. "My sister was over there bofer nine o'clock this morning, and Aunt Martha seemed the same as usual. She must have been taken very suddenly."

"Fixing to go to town, too, wasn't she?" continued Zeke. "Mis' Martin she told me she was. Said if I'd happen along this way to take her over, it'd be a favor. Looka there, will you?" he finished suddenly, pointing with his whip at something which had just sprung into sight far to the west. "A hearse, ain't it? Now, that's a little too sudden."

"It's one of those there motor cars," corrected Hannah, looking long and carefully. "A covered one. Likely as not it's a doctor they've sent for.

The Finest Separator in the World is Made in Canada "MAGNET"

Square Gears
One-Piece Skimmer
Double Support For Bowl
Solid Construction
Perfect Skimming
Long Life



Make More Money from Cows

Get More Cream—Cut the Cost of Running Your Dairy.

A cheap separator steals your dairy profits. A Magnet delivers all the butterfat the milk contains. It will skim as close in fifty years as it does to-day. Its solid construction, its sturdy materials, its special design make it a long-life separator that can never wear out. It must be well built to stand the terrific speed at which the bowl turns. Oiling and adjustment are rarely needed because it runs so easily and is so conveniently designed for quick cleaning.

Long Service: Perfect Service

The first Magnet Separator ever built is in our factory. It has been run the equal of fifty years twice-a-day service. Yet it skims as close and clean to-day as if it were new. Runs as smoothly as a watch because it is mechanically true. Every Magnet built has been constructed on the same lines with new features added that give years to the life of the machine.

MAGNET CREAM SEPARATORS

STURDY BUILD
Look at the strong build of the Magnet. Solid perfect castings, sound steel parts and bronze gears, designed with the weight low down. You need not handle the Magnet gently—it's built for hard wear, and years of it.

LONG-LIFE SQUARE GEARS
Beware of the quick-wearing worm-gears that are built to make cheap separators. Magnet works on square gears which mechanics have found to be best for high speed work. Remember they have the heft and weight to carry the load when milk is poured into the tank. And they are balanced true so that they will never wear out.

EASY TO RUN
There are scores of children operating Magnets to-day—it's the smoothest running separator in the world. Write Mr. Vipond of Donegal, Ont. whose seven year old daughter operates a Magnet. No stopping for oiling and adjustment, or taking the clogging matter from the skimmer.

EASY TO CLEAN
Best of all for the woman on the farm, the Magnet can be cleaned in five minutes. Henry Weimar's boy (Belmore, Ont.) was taking apart and fixing the Magnet at 6 years of age. Skimmer one-piece and open, can be cleaned up with hot water and a cloth. No awkward bends in spouts—cleaned quickly with our brush.

SKIMS THE LAST DROP OF CREAM
A clean, close skimmer, too, that takes off the very last drop of cream. Hot or cold milk, level or rough pressure the Magnet will skim close even up to 55 per cent. cream. Magnet wrench is only tool needed for any adjustment.

WRITE FOR OUR FREE BOOKS and A DEMONSTRATION

Here's the coupon. Fill in now and by return mail you will receive a beautiful big catalog and dairying literature. Illustrates every part of the Magnet. Read what farmers in your own province say. And we'll gladly come and operate a Magnet in your own dairy if you ask—not one cent of cost or the least obligation on your side. So write now— it will be to your benefit.

'Tain't likely she's—she's—gone yet."

"Well, I aim to get there ahead of that there thing if I spoil the hull procession," exclaimed Zeke, speeding up with sudden vigor.

Every one else seemed all at once seized with the same ambition, and shortly they began to arrive and turn in or tie before the Willets home.

Everything was still about the house. They had expected that. The shades were down, and the door decorously closed. That was only natural. But they had not expected to find Uncle Ephriam standing in dazed fashion on the doorstep, looking in bewilderment from the crowd of sympathizers to the closed door.

Miss Polly, with the familiarity of near neighbor, alighted and pressed forward through the gathering.

Low-voiced comments floated to her ear.

"Dod they telephone to your folks?"

"Well, no. Fact is, I didn't know a thing about this till I got here. I come to carry Mis' Willets over to the station. She asked me herself this morning."

"Queer! I had that in mind, too. Seth Wood asked me to come. Ephriam had asked him, and it 'peared he wasn't sure of being able. That's why he asked me; but I see Seth's made out to come, and his wife, too."

"Oh, anybody would come in a case like this."

Miss Polly pushed on, but the murmurs followed:

"How'd it happen?"

"I really didn't hear. Fact is, I didn't know a thing till just now. You might have knocked me down wirh a feather. I came a-specting to carry her over to the station. Ephriam spoke to me about it on the way over to the sale, and me and my wife came right over."

"Mis' Martin asked me to come over for that same reason. It seems that she wasn't sure Jack could go. I see they've made out to come for this."

Miss Polly pressed on up to the door.

"Who's caring for her, Ephriam?" she asked in a tense whisper.

The old man turned startled eyes upon her.

"I—I—don't know," he faltered. "I —I can't get in."

Miss Polly thrust deft fingers under the accustomed doormat and produced the key, which Ephriam, moving like one in a dream, thrust into the lock and turned. Then together they entered.

A deathly hush lay over the darkened interior, broken only by the complaining drone of a distant lonely fly.

"Where's she gone?" demanded Ephriam of the leaders of the crowd which pushed in after him. "Where'd they take her?"

"I don't know." Hank Burton looked pityingly at the bewildered face of his neighbor. "I came aimin' to carry her to the village. Did you hear anything, Jake?" He referred to his nearest neighbor, and one by one the question was passed to those without.

"The ambulance!" was wafted back, and again there was a surge of the company, this time toward the outside, where they saw a large motor car glide into the yard.

"The ambulance, Ephriam," soothed Miss Polly, unconscious of the tears which traced their way down her own cheeks. "Now we'll know where she's been taken."

But the glittering exterior of the great car, radiant in its newness of enamel and nickel plate, yielded up no corps of dignified doctor and uniformed nurse.

Instead, the familiar and rather sheepish face of Tim Follet was thrust from its depths.

"Why, 'ello, folks!" he saluted in some embarrassment. "Come to give me a send-off? To tell the truth, I give up going west. Put the money into a car instead. Funny you all found out I was a-coming."

FOR DELICIOUS STRAWBERRY PRESERVES

tell your grocer to send you

Lantic Sugar

"The All-Purpose Sugar"

packed in original bags or cartons

The accurate weight of LANTIC SUGAR in original packages is a great help in preserving as it enables the work to be done without weighing the sugar. For strawberry preserves in light syrup use 4 quarts of berries to a 2-lb. carton of LANTIC SUGAR. For richer preserves increase the proportion of sugar according to taste.

PRESERVING LABELS FREE—Send us a red ball trade mark cut from a bag or carton and we will send you a book of 54 ready gummed printed labels containing 6 for each of the following fruits: strawberries, raspberries, blackberries, currants, grapes, cherries, plums, peaches and pears. Address

"We didn't," returned Caspar Ray; and something in his sepulchral voice changed the sheepish grin on Tim's face to an expression of concern and alarm.

"You don't mean to tell me that Aunt Martha's been took?" he exclaimed in an awed whisper. "Land, but it must have been sudden! I wrote her a letter just yesterday. How'd she go?"

"Can't nobody seem to tell." Zed Harmon edged his way through the crowd to add his meager mite of information to the little the others had to convey. "Some think she was took in the ambulance, but they ain't sure, for she was all alone when it happened."

"You don't mean to say—" began the newcomer, looking amazedly from one lugubrious countenance to the one next it. "What I want to know is—"

The knowledge which he sought was destined to be withheld, at least for a time. At that moment the general attention was diverted by the sound of clattering tins, which rang out discordantly above the solemn murmur of hushed, awe-stricken voices.

"Such a time to be drivin' up in his old peddling wagon!" commented Mrs. Jackson severely, as a gaily painted peddler's cart, flashing its bright wares from top and sides, rattled into the yard.

It did not stop decorously on the outskirts of the serious assembly into which it had unwittingly intruded, but wound its glittering way unabashed up the curved driveway to the very portals of the silent house.

"Land, but I'm glad to get back!" remarked a well-known voice from beneath its gaudy canopy. And there, surrounded with a radiant aureole of gleaming pails and pans and mixing bowls, her mouring friends looked and beheld the lost—the late-lamented Aunt Martha!

"Where you been, Martha, leaving me like this?" hoarsely demanded her husband, holding up trembling hands to help her from her resplendent equipage.

"Been to the station, like I said I would," returned the truant, without emotion. "Land, Ephriam, but you do look fussed up! Comes of going to sales and not getting your meals regu lar."

At this light, not to say flippant, remark from one whose seizure or sudden death the whole assemblage had been interrupted in the act of mourning, Ephriam's face showed signs of sudden and violent agitation. Its color changed from white to a red which increased to an almost apoplectic hue. Unnerved by this abrupt change in his mental attitude, the flood of tender regrets with which he had just been overwhelmed, curled all at once, and burst forth in a torrent of unreasoning anger.

"A pretty way to act!" he stormed wrathfully. "A-sending word to every man in the hull community to come and carry you to town, and then to go gallivanting in a red peddling wagon! Here you been and left the entire neighborhood to ball itself up into a funeral for you. And even the corpse was missin!" concluded Ephriam, in a tone of one who detailed the very climax of accumulative wrongs.

Aunt Martha gazed for a moment at the congregation of vehicles which congested the highway outside their own gate; at the convocation of inquiring faces which looked at her from the farthest reaches of her own front lawn.

If a twinkle appeared in the gray eyes back of the silver-bowed spectacles, Miss Polly was not near enough to see it, but she plainly discerned a quivering of the broad shoulders beneath the best black sateen waist.

When Aunt Martha at last spoke, it was in tones of stern placidity.

"You're no Turk, Ephraim Willets," she answered firmly, "to want to keep your women folks housed up all the time you're away from home; and I'm no Turk, either, to stand it if you did. As for my going off in a peddling wagon," the wood woman's voice rang a stronger note of independece, befitting the day, "I seemingly had to go to town, and I went with the first man in a two days' search who know where he was going and when he was going to start. It wasn't his fault that the pressing demands of the tin trade caused us to miss the train. If, as you say, all this pretty company gathered for the sole purpose of carrying me to town"—again there was an agitation of the sateen shoulders—"I am sure it was right handsome and neighborly of every one of them. As long as Tim Follet has come for an outing in his new dufunny, it's just as well they did. Now, if all the men folks will find places to sit down," Aunt Martha included the whole gathering in one comprehensive gesture, "and the women will follow me, I reckon we can find tea and victuals to turn this mourning assembly you spoke of into a real Fourth of July picnic."

With this effective conclusion, Aunt Martha's person made a majestic entrance into the shadows of her home.

Many a can after attaining a high position in life forgets all about the laws of gravity until it is everlastingly too late.

The headache that a man doesn't have the morning after is the one he enjoys most.

CARE OF YOUR TABLE LINENS

Good linen in the first place means much. But care of the same linen means more.

Strong bleaches must never be used on fine table linen. Of course table linen is often badly spotted and needs to be cleansed in some way. But boiling water removes coffee spots, cold water removes cocoa spots, and sunshine removes many stains. When stronger acids must be used they should be applied and removed by intelligent hands.

They should be allowed to remain on the spots just long enough to eradicate them, and then rinsed out thoroughly in clear water. For if they remain on too long they remove not only the stain but the pieces of linen.

Some old-fashioned housewives occasionally have their table linen dipped in buttermilk to whiten it. The linen is allowed to remain in the buttermilk a day or two if necessary, and is then thoroughly rinsed in cool, clear water, later in warmer water.

For fruit stains, pour boiling water through them while the stains are damp, if possible. If they dry on, rub them with lard and put through the usual washing process.

Always dry table linen out of doors in the sunshine. If possible have a little bleaching green of grass, protected from the inroads of coats and dogs.

Perhaps every woman at one time or another finds that some wet pieces in her soiled laundry bag have caused mildew among the clothes.

To remove this, rub the spots with soap and cover them with chalk. Then put them in the grass in the sun. Keep it slightly damp for an hour or two, and then let it dry thoroughly.

PROVINCIAL EXHIBITION
HALIFAX
SEPT. 13 TO 21ST

As **Greater Production** is the cry today in Canada, the Exhibition Commission have decided to hold their Annual Fair notwithstanding the war is still going on.

A very large increase has been made in the Prize List for Live Stock, and a number of classes have been added.

Owing to our fixed opening date (the second Wednesday of Sept.) falling on the latest possible day of the month, should give a splendid exhibit of Agricultural and Horticultural products.

Prize Lists are now out, and persons not receiving same can have them mailed by writing the Secretary:

M. McF. HALL
Halifax

"Dad, what is a roost?" asked Charlie.

"A roost, my son, is a pole upon which chickens sit at night," replied his father.

"And what's a perch, dad?"

"A perch is what chickens perch on."

"Then I suppose, dad, a chicken could roost on a perch?" came the further inquiry.

"Of course," was the smiling reply.

"And they could perch on a roost?"

"Why, y-yes," answered dad.

"But if chickens perched on a roost, that would make the roost a perch, wouldn't it? But, if just after some chickens had perched on a roost and made it a perch, some more chickens came along and roosted on the perch and made it a roost, then the roost would be a perch and the perch would be a roost, and some of the chickens would be perchers and the others would be roosters, and——— Well, there?"

It's the easiest thing in the world to be brave when there is no danger.

Opportunity likes to knock at the door of the man who has a little cash saved up for a rainy day.

Rock and Brick Face
"METALLIC" Siding

Get Real Tire Economy!
Motoring is two things—a pleasure and a business. One might say it was used sixty per cent. for entertainment and forty per cent. for commercial purposes. Yet no matter whether you use your car to get orders or ozone, your greatest economy will be the reduced cost of mishaps.
No accident ever befel an automobile but what the tires were forced to play a part in it. And no accident ever was averted but what the tires had a say in that, too.
If you will drive fast,
If you will make those sudden stops,
If the city will water asphalt,
If rain will make muddy roads;
Why then—the possibility of skidding will always be with you, unless you figure on those elements of danger when you buy your tires. When you think of how to avert danger in motoring you immediately think of . . . . . .

CONTROL POTATO DISEASES BY PRACTICAL SCIENCE

(Continued from page 629)

and kept in separate covered barrels throughout the spraying season.

Potato spraying attachments are now made for most good sprayers and from four to six rows can be sprayed at one time. The latest devices have the nozzles arranged so that the vines may be sprayed from beneath as well as above, which is important, as all parts of the plant above the ground should be protected.

In order to prevent the very evident loss by disease, it will be necessary for the farmer to follow the lines here laid down for the elimination of diseases, when it will be reasonable to expect that the diseases be eventually exterminated or reduced to a minimum. Any objections a farmer may have to carrying out the preventative suggested in this article will disappear when he finds from experience that their observance results in a greatly increased yield and higher profits to himself.

THE COLLEGE WHICH SAVED OUR LIVE STOCK

Of all the colleges which have been founded and have flourished in Ontario none has met with greater difficulties in becoming established nor have vindicated more fully their usefulness and importance than those two catering most directly to the needs of the farmer—the Ontario Agricultural College and the Ontario Veterinary College. Of the former much has been said in way of explanation and appreciation in the farm journals. But of the good services of the latter not so much has been written and probably by many are not so well understood. In any number of an agricultural journal devoted to educatioal facilities for the farmer and to education that vitally affects his business the work of this important institution should have a place. Its value to the agricultural interests of Ontario, and indeed to those of the entire Dominion, cannot well be overemphasized.

Far back in the history of the province, as development is measured, but not so distant as years go, the veterinary surgeon was pretty much an unknown quantiyt. In the memory of many still living his place was occupied by the "horse doctor," a man of rough skill, perhaps, but no science. In those days every horseshoer was a "horse doctor," of parts, while few indeed ever attempted to make a living by the practice alone. In some measure every farmer was also a veterinarian, administering such medicines and applying such remedies as were at hand, each having his own cures, secret or otherwise, and each entirely convinced that his own were the best.

A New Era for Ontario

It was natural, of course, that these conditions should exist in a new country sparsely settled and with little live stock. But toward the middle of the past century it became clearly evident that a new day was dawning for Upper Canada (as Ontario was then called), and with it must be established a new order. As far back as 1833 an extensive importation of stock had been brought in by a farmer, Rowland Wingfield, living near Guelph, Ontario. Others followed, until large numbers were in the province. Then the owners found themselves confronting a grave problem. When any of their stock became stricken with a serious or a contagious disease they were at a loss to prevent its recurrence or spread themselves, and had no one to whom to turn for skilled assistance or advice.

Thus was the college founded through great need, although, if the truth be told, not a need always felt by some of those most vitally affected; even at a later date the need for a college of agriculture was not realized too generously by the agriculturists, who stood to gain the most from its services. The idea of scientific agricultural knowledge was new in those days; that was the root of the trouble perhaps.

The Man of Destiny

Now, while matters were thus reaching a head, a young Scot, by the name of Andrew Smith, was forming a vision of the greater Canada that was to be developed from the land of his adoption. He had faith in it and faith in himself—that combination of qualities that makes of the young man a force which will not be denied. With keen foresight he saw the possibilities for the qualified veterinarian in Canada, and returned to his native land to take the course of studies prescribed by the pioneer British veterinary school in Edinburgh.

Meanwhile men of rank and influence were bestirring themselves in Upper Canada to rectify the deplorable condition of affairs already described. The Board of Agriculture, which had been organized to promote agricultural shows, succeeded in having agriculture made a subject of study in University College, Toronto, George Buckland being made professor. It was then deicded that nothing of more importance to agriculture could be done than to secure a capable veterinarian who could train students in matters pertaining to the science. Accordingly Professor Buckland crossed the Atlantic in 1861 to consult Professor Dick, Principal of the Edinburgh Veterinary College, regarding a suitable man.

And this was the chance Andrew Smith, the man of faith, had been building upon. He had recognized the knock of opportunity and had prepared himself. So when he was recommended by Professor Dick he accepted the position and returned to Toronto to establish the first veterinary college to be founded in Canada, and one of the first upon the North American continent.

Since that time the wonderful development of Ontario's live stock interests has been intimately connected with the growth of the O. V. C. The year it was established this province had a total of 113,647 horses and 504,963 cattle. In the 1914 report of the Ontario Department of Agriculture—the latest issued—Ontario is credited with possessing 774,544 head of horses and 2,604,628 head of cattle, while live stock holdings of all kinds are valued at the great sum of $250,870,078. Thus has the province flourished—and its progress has been made possible by the thousands of graduates of the Veterinary College, who have been very alert to protect our animals from contagion and to stamp out disease which gained entrance.

GET ALL THE BUTTER FAT

To operate at *full efficiency* and deliver *all* the cream, your separator must be lubricated with an oil exactly suited to its construction. Many oils form "gum," thereby clogging the delicate mechanism of the separator, and thus causing irregular spinning of the bowl, reduction of speed and consequent loss of cream.

Standard Hand Separator Oil

is made especially for cream separators by oil experts of years' experience who have studied the detail construction of the separator—this in order to produce an oil exactly adapted to the purpose. Your separator will do better work, last longer and need fewer repairs if lubricated with Standard Hand Separator Oil. ***No matter what you pay, you cannot buy a better oil for the purpose.*** Dealers everywhere.

THE IMPERIAL OIL COMPANY
Limited
BRANCHES IN ALL CITIES

Not only that, but the college has, through its students, created a reversal of public opinion regarding the "horse doctor." Rule of thumb and the practices of the quack have given way to scientific accuracy. All the sciences relating to the prevention and cure of disease and to surgery have their place in veterinary theory and practive even as they have in human medicine and surgery. The old-time trade, or worse, has become a learned profession in which educated and respected men do a vitally necessary part of the world's work and which is duly appreciated. Today the standing of the graduate of the Ontario Veterinary College is second to no graduate of any veterinary college in North America. Indeed, in many states he is given preference.

Slow Development at First

But this development was not a thing of a day, naturally enough. It took time. In 1862 the first course of lectures was given by Professor Smith, while the second course in 1863 was for the first time advertised as being under the auspices of the Upper Canada Veterinary College. The first three students were graduated in 1866. And so the work proceeded slowly. The college was privately owned and had hard work to bring public opinion to its support. Gradually it won ground, until in 1889 a new building was provided because of the increased number of students.

But it is not the purpose of this sketch to burden the reader with the details of the growth of the college. Suffice it to say that in 1908 the institution was taken over by the Ontario Government and in 1914 the present building was constructed. It is situated on University Avenue, near Queen's Park and is completely equipped in every particular. It is particularly well lighted, heated, and ventilated, and imposing in appearance—is a credit to the government.

The college has been affiliated since 1897 with the University of Toronto, and by that institution the higher degrees of Bachelor of Veterinary Science and Doctor of Veterinary Science are conferred. The degree of Veterinary Surgeon is conferred upon three-year graduates by the college. Dr. E. A. A. Grange, of the class of 1873, long engaged in teaching and research work, and a man of continental reputation, has been principal since 1908. Sanitary inspection and the development of science generally has made necessary the placing of additional subjects upon the curriculum in recent years, which in turn made imperative a three-year course of study for the V. S. degree. The standard now is very high, and the graduates are among the most efficient of the profession.

Ontario Farmers Appreciate Course

How Ontario farmers have appreciated its worth—for the majority of students come from farm homes—is forcibly shown by the greatly increased attendance. In years gone by some 60 per cent of the students came from foreign lands, the other 40 being recruited from all parts of Canada. Of the 190 students who wrote examinations this spring, 80 came from Ontario, 59 from other Canadian provinces, and 51 from foreign lands. And these figures do not tell the whole story. For the great war has spoken to the O. V. C. as it has to every college in Canada. It has sent its quota to the firing line in the battle for liberty and human democracy. Already the honor roll totals nearly a hundred —and the end is not yet. In war as in peace the college is doing its bit. We may rest assured that, at home or abroad, the "grads" will not fail. They are true Canadians.

TUNING UP THE MOWER

Just because the old mower pulls hard, has excessive sidedraft, breaks knives continually, or has a badly worn beveled pinion on the crank shaft is no reason why the whole machine should be consigned to the scrap heap and $45 laid out to replace it. No farm machine suffers more from misadjustment than the mower, and the situation is the more to be wondered at because the old mower can be so easily put into excellent cutting condition. With slight expense for a few new parts, and with a little care in adjusting the old parts, the working qualities of the old mower can be made nearly as good as new, and the cost of a new frame, new wheels, and new shafts thus avoided.

The causes for heavy draft are poor lubrication, dull sickles, sidedraft, and non-alignment. The remedies for the first two causes are obvious. Sidedraft is caused by misadjustment of the cutter bar parts, which results in some of the grass being crushed and pulled off as the mower advances instead of all of the stems being quickly and easily cut off as the knife reciprocates. If the cutter bar cannot cut the stems off quickly and easily the grass will pull back upon the bar as it moves forward, causing undue re-

PEDLAR'S
"GEORGE"
SHINGLES
THE roof of your barn is the first part to feel the effects of wear and weather. Make your roof wear-proof and you add many years of better service to your whole barn. Pedlar's "George" Shingles not only offer the safest protection against weather, wind, fire and lightning, but the way they lock together, tight on all four sides, makes them practically indestructible. Impossible for wind, rain and dampness to get beneath shingles and start to rot and decay your roof. For a permanent barn roof, Pedlarize now. Write for "The Right Roof" Booklet M F

The Lock that Holds

sistance well to one side of the true line of pull, and what is commonly known as sidedraft results.

The cutter bar of the mower is nothing more or less than a series of shears. We are well aware of how a pair of scissors will bind cloth between the blades and work very hard if the scissors are loose. By tightening the screw which holds the blades together the scissors can be made to cut the cloth cleanly instead of wedging it in between the shearing edges. The same principle is found in the cutter bar of the mower. The knife sections are one set of shearing edges; the ledger plates in the guards are the other set of shearing edges; and the clips correspond to the screw in the scissors, their function being to hold the two sets of cutting blades close enough together so that there will be perfect shearing action instead of a tendency to draw the grass in between the knives and cause objectionable binding and crushing.

Adjusting Cutter Parts

The first requisite for a good cutting condition is that the guards be perfectly in line with one another. If a guard is bent down its ledger plate will be carried away from the corresponding knife section. If a guard is bent up it will force the knives off the ledger plates of the adjacent guards. From the outer end of the cutter bar sight along the under side of the guards and drive back into alignment any guards which are bent up or down. They are malleable.

After the guards have been aligned, carefully examine the knife to see that its sections are held down in close proximity to the ledger plates. Excessive wear on the under side of the lips of the clips will allow the grass to force hte shearing edges apart. On old mowers one can usually slip a silver quarter between any knife section and its ledger plate. Trying to cut hay with such adjustment is like trying to cut cloth with a very loose pair of scissors. If considerable play is found between the knife and the ledger plates, bend down the clips by hitting them gently with a hammer, great care being taken not to bend down any clip enough to cause binding of the knife. It is well to test the knife by moving it by hand after each stroke of the hammer to make sure that binding has not been caused. If the clips are badly worn new ones should be supplied.

The wearing plates found under the clips on most mowers are adjustable, and they should be moved forward sufficiently to prevent excessive lateral play. Badly worn wearing plates will allow the points of the knife sections to raise from the ledger plates even though the clips are properly adjusted to hold down the rear of the knives. Such a condition can be remedied only by supplying new wearing plates, and further clip adjustment should not be attempted. On some mowers a little wearing bar in each guard takes the place of the wearing plate. On such mowers these wearing bars can be reversed when badly worn, and finally replaced at slight expense.

Causes of Sidedraft

In order to cut short, thick, green stuff, operators of old mowers often think that it is necessary to bend down the lips or wings on the guards. Such practice is to be condemned, for besides leading to clogging troubles it is an attempt to effect a remedy without affecting the cause for the trouble. If the cutter bar parts are properly adjusted, as described above to produce perfect cutting action, no difficulty will be experienced in short grass, and there will be no need for bending down the wings of the guards.

Another cause for sidedraft in mowers is noncentering of the knife. When the knife completes its "out" stroke of its "in" stroke it should stop with the center of the knife sections in the center of the guards. If the knife comes to rest with its point between guards the grass between the extreme point of knife and guard will remain uncut until the knife makes a second trip. This will result in uneven stubble and some dragging back on the cutter bar.

Noncentering is often caused by failure to make a new pitman exactly the right length when the repairing is done in the home shop. It may also be caused by excessive strains. Some mowers carry special centering adjustments which force the cutter bar out or in without changing the position of the knife. If no special centering adjustment can be found, centering can usually be accomplished by shortening or lengthening the drag bar, which runs from the balance wheel casting to the yoke to which the cutter bar is hinged.

The advantages of replacing badly nicked ledger plates and knife sections, and of using sharp knives, are obvious. The frequency with which it is necessary to sharpen mower knives can be lessened by keeping the cutter bar parts in their proper relation to each other.—C. O. Reed, Instructor in Field Machinery, University of Illinois.

THE STUMBLING HABIT

The habit of stumbling is natural to some horses, and others acquire this through careless and ignorant treatment by their owners. This is a bad habit from whatever source it comes If it is natural with the horse since colthood, he is a hopeless case. His manner of traveling, when driven may be improved greatly by careful driving. It is best to hold the stumbler with a tight rein and check him up moderately high. In no case abuse the horse for this.

The manner in which a horse is shod has much to do with the stumbling habit. A horse that is shod heavily in front and light behind for a number of times is almost sure to acquire this habit. It may also be the result of weak joints or imperfectly formed legs.

A horse that is badly knee sprung is almost always addicted to stumbling. If this defect is noticeable in the youngster, do not buy him with the intention of his developing into a sound horse. Serious accidents are likely to occur from the stumbling habit. If the animal shows any tendency toward stumbling, see to it that he is properly shod, and use all other means and care of driving, etc., to bring him out of it.—P. A. Anderson.

BREAKING UP BROODY HENS

Before closing up at night I make the rounds of the houses and take in charge all hens found on the nests. The broodies are placed in a small house that is bare of all furnishing except several perches and a dropping board. A strong, active male is also kept in the house.

The broodies are supplied the regular ration and are given all the milk they will consume. In three days they are given their freedom, and rarely does one go back to the nest. Usually in a week after being removed from the nest they are laying again.

The broody hen is not hard to break up if she is taken in charge the first night she remains on the nest. If permitted to remain on the nest several nights the broody fever increases and the task of getting her to change her mind becomes a difficult one. Besides, when not taken in hand immediately, a broody hen loses flesh rapidly, which must be regained before she can lay again.

Starving a broody hen with the idea of breaking her up is the worst possible thing that could be done. When, after being subjected to the starving method, the fever finally leaves her, she is in such run-down condition that weeks of good feeding and good treatment will be required to get her in shape to lay again.—T. Z. Richey.

READ THESE BOOKLETS AND YOU'LL BE PLEASED

The Canadian Publications of the Canadian Government Railways This Season Will Delight You

(Halifax Herald)

The summer publications of the Canadian Government Railways have just appeared, and they are a delight to the eye and a pleasure to the intelligence—beautifully printed and illustrated, and full of interesting and informing reading matter—a real credit to the advertising department of the People's Railway. The books make a collection of seven, including the red folder of "Summer Excursion Fares" of the government Railways system from the newest Musquodoboit branch to far-off Winnipeg, for the government system now stretches from the Sydneys and Musquodoboint in the east to the very centre of the continent at the prairie capital. "Summer Excursion Fares" also has a list of hotels and rates.

Each of the booklets has its own different story. Three are devoted to the Bras d'Or Lakes; Prince Edward Island, the euphonious "Abegweit"—cradled on the waves," according to the happy and picturesque symbolism of the noble red man; La Baie de Chaleur, the name given the beautiful inlet of the sea by Jacques Cartier in 1534, when that gallant French navigator sailed into the magnificent haven. The loveliness of those territories and waters, made accessible by the Canadian Government Railways system, can never be forgotten by those who have seen it, and that is almost every one now, but those who have not had this privilege may obtain a fascinating idea of nature's matchless beauty as there displayed by the reading of these charming brochures and the others of the series. They are worth perusal by those who may not immediately intend seeing the country described, but for those who have seen it and who may propose doing so they are invaluable.

There are also the twin booklets "Notes-by-the-Way"—one describing in "Lines Quebec and West" the country from Quebec's ancient capital with its past romance and its present attractiveness to Winnipeg. Some of the chief points of interest are noted and illustrated, for it would take a big volume to tell anything of them all. The happy art of condensation has been well displayed in the preparation of this booklet, as also of its mate—"Lines Montreal and East." Each of the "Notes-by-the-Way" booklets comprises about thirty pages, and the reader who puts in a couple of hours in the study of them will find himself a better-informed, more intelligent reader, and he will have had a very pleasant time turning over the pages and noting the points of the story. Those booklets are well worth reading, and if taken along when on a journey over the Canadian Government Railways will add to the delights of a summer trip. The man or the woman who reads them, if he or she has any idea of making a railway excursion somewhere, is almost sure to decide in favor of seeing the panoramas that will unfold on the lines of the people's railway, whether in Cape Breton, through Nova Scotia, up to northern New Brunswick, or along the St. Lawrence to Quebec and Montreal. And the journey need not stop there, for, going by the Canadian Government Railways, after leaving the I. C. R. at Quebec the traveller may go through newer Canada and past the great lakes to Winnipeg, by the "Western-National," and returning by the "National-Atlantic," express trains with the most modern equipment and affording a service equal to any.

One booklet more remains—"Out-of-Door," sixty pages of information for the tourist, the hunter, the fisherman who may purpose a trip in Quebec or the Maritime Provinces. It gives the basis of all information needed as to fish, games, hotels, guides.

There could be nothing more complete or attractive, or more useful, than this series of booklets for the use of travellers on what is the great system of Canadian Government Railways, and all who had anything to do with their preparation and publication are to be congratulated on the success achieved. "The Summer Publications" cannot but have good results.

Brown's Flats, N. B.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

FOR SALE.—Two registered Durham Bulls.—STUART DODGE, Melvern Sq., N. S.

WOULD YOU MARRY IF SUITED?—Best matrimonial paper published. Mailed FREE.—THE CORRESPONDENT, Toledo, Ohio.

FOR SALE.—Four young heavy horses.—ROBERT J. STEWART, Cole's Island, Queens Co., N. B.

FOR SALE.—Eight six-month-old best registered Ayrshire and Holstein Bulls, $50.00 each.—E. M. WHEATON, Putnam, Conn.

HAMPSHIRE SHEEP.—A nice lot of pure bred Hampshire Sheep for sale at reasonable price. Apply to GEORGE R. WARD, West Bathurst, R. R. No. 1, N. B.

WANTED TO PURCHASE—Two Registered Yorkshire Sows of the very best breeding. Communicate, stating price and age, with F. W. SUMNER, Moncton, N. B.

EGGS FOR HATCHING.—Pure bred Rose Comb Rhode Island Reds. Good winter layers. $1.00 per 15.—MRS. B. H. SMITH, Young's Cove Road, N. B.

WANTED.—Maid for general housework in family of three. Apply, giving references, to MRS. HAROLD WILSON, 33 Seely St., St. John, N. B.

PORTRAIT AGENTS WANTED.—Send for catalogue. Solar and bromide prints, portraits flat and convex, frames and water pictures.—MERCHANTS PORTRAIT CO., Toronto.

WANTED IMMEDIATELY.—Reliable agents, good pay weekly, outfit free, exclusive stock and territory, our agencies are valuable For particulars write MANAGER PELHAM NURSERY Co., Toronto.

BOYS AND GIRLS MAKE $1.00 selling 25 packages Empire Court Plaster. Three colors. Antiseptic. Sells quick at 10c each. Order now. Send no money until sold.—VINCENT DAVIS, Box C, Beebe, Que.

LADIES WANTED to do plain and light sewing at home, whole or spare time; good pay; work sent any distance; charges paid. Send stamp for particulars.—NATIONAL MANUFACTURING CO., Montreal.

FOR SALE.—A pure bred improved Berkshire Boar, 2 years old, 1st prize at Fredericton, 1915; a number of Pigs ready for delivery, also a Shorthorn Bull calf, two months old, milking strain, prices reasonable.—SHAW BROS., Highland Stock Farm, Hartland, R. F. D. No. 3.

BANTAMS.—Our full stock of Bantams and Pigeons for sale, including all our prize winners at Halifax, Amherst and Charlottetown. All first class stock. Write for prices on your choice varieties.—SPRING PARK POULTRY YARDS, Charlottetown, P. E. I.

FOR SALE.—A large three-story house, nearly new, fitted up in fine shape, suitable for two families or hotel, also barn and two and one quarter acres of cleared land, situated near Enfield Station, on I. C. R., will be sold to settle estate Apply to DONALD FRASER, Nine Mile River, Hants Co., N. S.

BUFF ORPINGTONS

I have changed my place of residence from Amherst to Oxford Jct. N. S. and am better prepared than ever, to supply those wishing Buff Orpingtons stock or eggs, the ideal table fowl and winter layers. Our winnings at the Maritime Winter Fair against strong Competion were as follows 1st cock 1st hen 1st cockerel 1st 3rd pullet, 2nd utility Cockerels 1st & 2nd utility pullets and 1st pen.
Our breeding pens are mated as follows
PEN NO. 1 Headed by "General Joffer" 1st cockerel at Halifax, F'ton, and Amherst mated with the 1st pen at the same shows, with 5 others of equal merit. Eggs $3.00 per 15
PEN NO. 2 Headed by "Kitchener" 1st Cock at Halifax, F'ton, and Amherst mated to the 1st 2nd Pullets with six others just as good. Eggs $2 00 per 15.
PEN NO 3 Headed by "Prince" never shown, but an exceptionly fine utility bird good eve, color right through with lots of size mated with the 1st & 2nd pairs of utility pullets at Amherst 1915 with others that will produce stock that will fill your egg basket next winter Eggs $1.50 per 15
All infertle eggs replaced free of charge

R. R. BLACK, "Elmhurst Farm,"
Oxford Junct., N.S.

You can judge no woman's sense of humor by the way she giggles at her husband's jokes.

College will reopen on

MONDAY, OCTOBER 2nd, 1916

Calendar on Application.

E. A. A. GRANGE, V. S., M. S., Principal

R. O.M. and R. O. P. Holsteins

Would you like to get a good foundation? Holsteins of this calibre are seldom offered at any price, but we are overstocked and will offer::—

2 Daughters of "Ruby Nig" whose 7 day record is 567 lbs. milk, 25.60 lbs. butter; yearly record, 16,555 lbs. milk, 750 lbs. butter; the second highest record in Canada at 3 years of age.

2 Daughters of "Black Rose Beauty" whose record is 522 lbs. milk, 24.60 lbs butter in 7 days.

2 Daughters of Miss Rooker Posch, whose record is 402 lbs. milk, 16.114 lbs. butter in 7 days; 12,268 lbs. milk, 600 lbs. butter in one year, when 3 years old.

2 Daughters of Beauty Rooker, whose record at 2 years of age is 322 lbs. milk, 15½ lbs. butter in 7 days; 11,248 lbs. milk, 517 lbs. butter in one year.

And several others of equal breeding, sired by or bred to "Ida Rooker 2nds Vale," a sperior animal in every way and a proven producer of rich milkers. Also some extra nice bulls of the above breeding, all at reasonable prices.

LEA & CLARK, Victoria, P. E.

ELMHURST SHORTHORN STOCK FARM

Present Offerings—Six exceptionally good red and roan bulls, 10 to 18 months of age, from superior milking dams. Write me for prices and particulars before placing your orders elsewhere

C. C. H. EATON, - - - - CANARD, N. S

TWO BIRDS WITH ONE STONE

There isn't much fun in just picking up stones and hauling them out somewhere and dumping them off in a pile. The other day I drew the loads of stones over to cut or draw where quite a head of water comes down in spring and dumped them to form a sort of dam across the draw.

Sediment, trash, and dirt will accumulate there and in time fill up the hollow level, adding to the area of my field. It will be good alluvial soil, too. This is more satisfaction than I ever found before in picking rocks. I was removing rocks which rendered a field practically worthless and taking them where they will do good.

By taking earth from high places and filling in the low ones we accomplish two things at once in the way of making a field level.—W. F. Wilcox.

JERSEY BULLS FOR SALE

Three young bulls from R. O. P. dams with splendid records. We are so confident that these bulls will give satisfaction that we guarantee to refund the money and pay charges both ways if the purchaser is not satisfied. Order one. You run no risk whatever.

WM. CLARK & SONS
North Wiltshire, P. E. I.

FOR SALE

Farmer—Here is your opportunity.

6 head of pure-bred Hereford cattle, 4 head of grade Hereford cattle, all in pink of condition, for sale. I am going out of stock raising. Will make terms of payment easy to a responsible person.

B. W. RALSTON,
Amherst, N. S.

Jersey Bull for Sale !

A fine Jersey Bull, well grown, of excellent breeding, will be sold very reasonable. 15 months old.

SARAH E. MOSES SMITH,
Woodward's Cove, N. B.

300—Acre Farm, $1300

400 Bearing Apple Trees

Overlooking valley, only ½ mile to school, 40 rods to good neighbors, mail delivered, cream sold at door; 3 miles to village mills, high school, sweet corn cannery. Now keeping 20 cows (should keep 50.) Good judges say wood and timber should bring $5000 at market 3 miles away, 2 large barns, silo; house burned last year; new bungalow, now partly finished. Woman owner, to get immediate sale, makes low price, $1300, half down. For details see page 5, "Strout's Money-Making Farms," copy mailed free. E. A. SPRINGVALE HERD

Of choicely bred Ayrshires, Dairy Test Winners, herd numbers 30 head. Before buying, come and inspect our herd and get prices.

FRED S. BLACK & SONS,
AMHERST, N. S.

FOR SALE.

Bluebell View Holsteins are from the best stock to be had, being very closely related to two of the Toronto Champions. We shall have some Calves for Sale very soon, so write us for prices and don't forget we guarantee everything to be as represented.

WALTER PAYNE,
Bluebell ViewFarm, Lake Edward, N. B.

Maple Green Farm Holsteins

To avoid inbreeding, we now offer for sale our senior herd bull "Maple Grove Mercena Mercedes," coming 5 years old; weight about 2500 lbs., active, sure and exceptionally kind. His first daughter to be officially tested made 15.46 lbs. butter in 7 days at 1 year and 11 mos.; another at 2 years and 2 mos. was making nearly 3 lbs butter per day when she met with an accident and we had to drop testing her. His dam gave 12664 lbs. milk and 568 lbs. butter at 2 yrs. old in the R.O.P., and her sister Posch Mercedes Springbank 2nd, is the Canadian Champion 4 yr. old in the R.O.P. with 22000 lbs. milk and over 800 lbs. butter in the year. We are also offering Bull and Heifer Calves sired by him and "King Lyons Colantha" and out of high-class Record of Merit and Record of Performance Dams.

For further particulars write

R. L. HICKS
Dalhousie Jct., - N. B.

Springbrook Ayrshires!

Present offering several choice Cows and Heifers, all ages, and Bulls ranging from 6 to 17 months, sired by our imported prize winner, Grange Kelly, and out of some of the best cows we ever owned. We have also two choice Bulls, about 15 months old, sired by Springbrook White King. We can also sell some nice grade Ayrshire Cows, fresh or about to freshen.

Write us your needs in the Ayrshire line—we have started many young breeders on the right track and have replenished the herds of some of the older breeders. We can supply your wants.

See our herd at the Halifax Exhibition or better still come to see our herd in home quarters. Interested parties always welcome.

McINTYRE BROS.,
SUSSEX, N. B.

WINTERING BEES OUT OF DOORS

Woodstock, N. B., May 20.
Editor Maritime Farmer:

Dear Sir—It no doubt will interest your readers, especially those in New Brunswick, to know that we have successfully wintered bees **out of doors** in this Province during the past winter. This should be good news to those who would like to keep bees but have no suitable place to house them during winter. While we would not advise those who have been invariably successful with cellar wintering to change to outdoor wintering, yet we are sure that many would have better results if they did so.

While our results are for but one season, we feel that they are sufficiently conclusive to warrant the attempt on a much larger scale. Out of twenty colonies packed in quadruple cases, eighteen came through the winter in fine shape. Two cases were packed at Woodstock, one in the city of St. John, and two in Kings County, thus giving us results from both the inland and coastal portions of the province.

The bees were put into the packing cases much too late for best results. In fact, with no previous preparation, the colonies were packed about the time (November 15) they would otherwise have been put into the cellar. With one exception, no choice of colonies could be made, there being but the number nevessary to fill the case available.

The packing cases used were made from a model supplied us by the kindness of Mr. Morley Pettet, Provincial Apiarist for Ontario. In the two cases at Woodstock the materials used for packing was planer shavings. This material was also used in St. John. In the two cases packed in Kings County we used oat chaff mixed with short straw. In some of the honeyboards (used as covers) on the hives were holes of 2 or 2½ inches diameter for feeding and to allow for upward ventilation. Over these holes we placed folded sacks under the packing. On half of the hives the honeyboards were tight. Owing to the fact that we knew little of the condition of the colonies when packed we were, of course, unable to note any differences due to either the material used for packing or the difference in provision for ventilation.

We are of the opinion that the two colonies that did not survive would have perished under the most favorable conditions. Neither colony contained much over a pint of bees to begin with. One showed dysentary very early.

We were unable to observe very closely any of the bees except those packed at the Agricultural School in Woodstock. In this particular case the bees were packed November 10. They had no flight from this date until the 26th of March. We were somewhat alarmed several times during the winter at the numbers of bees that ventured out on bright days, alighted on the snow, and remained there. We also lost a goodly number on their first flight in a pond of water that surrounded the case. We filled the pond with excelsior and thus saved the lives of many bees.

On April 16th we observed the first pollen coming in. At this time red or swamp maple and poplar were in bloom. Our last examination of these bees was on May 15. On that date we found two of these colonies with eight frames filled with brood, drones in the hive, and queen cell cups started. We gave these colonies a second brood chamber.

One of the greatest advantages of outdoor wintering with us in this province will be the protection afforded the bees during the early spring. During this spring, for instance, we have had for the past three weeks almost continuous cold northeast winds. Many colonies of bees that were put on their summer stands fairly strong have been reduced to the verge of starvation—in fact, many have starved outright—because of the large consumption of stores necessary to keep up the temperature of the hive. Much brood has perished from exposure because the cold nights have driven the bees into smaller clusters. These results are bound to follow when bees are wintered in warm cellars and then placed out early and given no protection.

Yours very truly,
H. B. DUROST, B. S. A.,
Instructor in Beekeeping,
Dept. of Agriculture.

KILL HOG LICE

It has been estimated that a 150-pound hog has 92,000 drops of blood. Suppose he is supporting 1,000 lice and each takes one drop of blood per day, what per cent of his blood will be lost daily, and who will pay the bill?

The question is important right now, for lice are worse now than in summer. The hogs pile up closely and spend much time in their beds. The lice take advantage of the situation and breed rapidly.

To remove the lice is neither difficult nor expensive. Dipping as spraying with coal-tar compounds is dangerous in winter, but three other treatments are available. These are:

1. Equal parts of kerosene and machine oil mixed together and applied with an oil can, brush, or swab.

2. Crude oil (thinned with kerosene if too thick), applied with a brush or as a spray.

3. Powdered staphisagria dusted on the pigs, or steeped as a tea and applied with a brush or as a spray.

For a small bunch the first treatment is the most convenient, but when one has many hogs the crude oil is cheaper. Be sure to apply behind the ears and in both flanks. The lice prefer folds of the skin.

Clean the beds and pens thoroughly also. If these are thoroughly sprayed with the oil there should be no further trouble from the lice. If the hogs sleep in straw sheds one can keep them free from lice by treating them every two weeks. Try it.—R. C. Ashby, University Farm, St. Paul.

SAVE THE CLIPPINGS

We subscribe for and read a dozen or more agricultural journals. In these papers we find much useful information well worth preserving for future reference, and for a long time it has been a problem how best to do it. It is impossible to file all the publications, and then the task of finding some particular advice would be rather difficult.

Finally we have hit upon a scheme that works satisfactorily and anything desired can be found in a few minutes. First, we purchased 100 large manila clasp envelopes 6 by 9 inches in size. A box was then made of half-inch boards just wide enough to hold the envelopes standing on end. On the flap was written various subjects, beginning with alfalfa and extending down through the list and embracing all branches of farming.

The envelopes are arranged alphabetically and clippings from the various papers are filed away. In this way all the information desired is saved and kept within reasonable limits. If facts are desired regarding alfalfa or pumpkins, they can be found in two minutes. The box may be made of good material and put up above the desk or in the living room, where it is always handy.—C. H. Chesley.

THE DAIRY MOVEMENT IN P. E. ISLAND

George Barr, of the Dairy Division, Ottawa, in company with Harvey Mitchell, Maritime representative of the Dairy Division, Ottawa; Rev. P. C. Gauthier, and Andrew MacRae, a prominent Ayrshire breeder, have just completed a tour throughout Prince Edward Island, and already the good effect can be noted. A series of dairy picnics were arranged by Mr. Mitchell and the local Department of Agriculture to discuss vital questions with our dairy farmers. Every man is an expert, and spared no one who was not properly caring for milk, or any factory whose cheese or butter was not being made to the greatest advantage. Mr. Barr dealt principally with the care of the milk on the farm, and after visiting a factory in the morning was well prepared to talk to those who were producing the milk. In many cases Mr. Barr spent considerable time with the makers, throwing out hints, particularly about the fast working curds, the proper working and salting of butter. Andrew MacRae discussed the feeding and breeding of dairy cattle. Rev. P. C. Gauthier represents the Catholic clergy in agricultural matters, and appealed forcibly to every audience to forget race, color, and creed in order that progress might be made. He encouraged them to place a premium on quality of butter, cheese, pork, and beef. He emphasized the great possibilities of the island if intelligent effort took form in co-operative measures, dealing with every agricultural activity. Our boys and girls, he said, are our greatest assets, and too often left the island immediately they were of age. The problem of education was our greatest obstacle, and would never be satisfactorily solved until the small country school gave place to more essential effort where children would be taught in a more modern way. Consolidation, he believed, would be the solution of the problem.

Since the passing of the dairy legislation last winter there has been a decided impetus to excel. The work is now practically under the Agricultural Instruction Aid Act, from which fund the inspector is paid. He is directed by the Director of Agricultural Instruction in co-operation with the P. E. I. Dairymen's Association. The factories open, as a rule, about June 1st. Previous to this date the inspector, Mr. Morrow, visited as many factories as possible and suggested ways and means of improving surroundings. It is safe to say that every factory cleaned up and did some repairing, while in many large sums were spent on floors, vats, etc., while one butter factory purchased a pasteurizer. Cream grading is practiced in several sections. As a result in some places the quality of the output has advanced very much, and only recently test shipments have been made from which the buyer expects satisfactory replies. It is only a matter of time and some effort to bring our dairy products to a high standard.

Centralization seems to be the keynote in butter production in order that a large make is possible, which permits the purchase of high-priced machinery.

The dairy outlook is excellent this season. The weather has been exceptionally favorable, and the crops probably never gave greater promise, thus ensuring sufficient pasturage and large crops of hay. The root crop has got away with an early start, thus giving succulence for next winter.

One of our greatest needs is a dairy school situated in the Maritime Provinces, where our makers could get instruction by gathering together and doing the work, thus discussing problems as they arise. The schools in Ontario are out of reach for our individual makers. This is the only way by which uniformity of make can be ensured, providing the quality of the milk is reasonably uniform. If the Maritime dairymen are going to compete, some such action is necessary at an early date.

POTATO GROWERS, ATTENTION!

The potato crop may be greatly damaged, or perhaps a complete failure, during the present season unless farmers immediately adopt measures to prevent Late Blight or rust, which is usually favored by wet, cloudy weather.

The shortage in the potato crop last year throughout America was due laregly to Late Blight. This disease was more general than usual on account of the wet season. The possible potato crop in New Brunswick for 1915 was reduced approximately 25 per cent, or 3,000,000 bushels, owing to these conditions, and unless potato growers practice thorough spraying a still greater loss is likely to occur during 1916 if the present heavy rainfall continues. Undoubtedly the rains of June will also encourage the disease even though fine weather should prevail from now on.

Late Blight is an infectious disease caused by a fungus which attacks and destroys the foliage and also causes a very destructive rot of the tubers. The spread and development of this organism may be held in check by spraying with Bordeaux Mixture five or six times during the growing season.

Last season demonstration spraying experiments were conducted on farms in different sections of the province, which showed that the yield could be more than doubled by spraying to prevent foliage diseases.

Now is the time to adopt preventive measures if the best results are to be obtained; indeed, if the potato crop is to be benefited to any great extent, growers should start spraying immediately, or when the plants are from six to eight inches high. Good results can be obtained by spraying later, but "the early bird gets the worm." Spraying should be continued at intervals of ten days or two weeks, until five or six applications have been made.

Several strengths of the solution have been recommended, but either of the following have given good results: 4 bls. of copper sulphate, 4 lbs. of lime (freshly slaked), 40 gallons water; or the same formula, using six pounds of copper sulphate, has been recommended by some experimenters.

Separate stock solutions of the lime and copper sulphate will keep indefinitely and may be made up at the beginning of the season; but the Bordeaux resulting from the mixture of the lime and copper sulphate will not keep and should be made up only as needed.

Stock solutions:

(A) Dissolve considerable copper sulphate (sufficient for the season) at the rate of one pound in a gallon of water.

(B) Slake the lime and add water to make a milk of lime. equal to one pound in a gallon of water.

To make the required mixture, dilute four gallons of the copper sulphate solution up to twenty gallons, and four gallons of the milk of lime (after stirring up) to twenty gallons, and mix these two diluted solutions in the spray tank. Apply at the rate of one to two barrels per acre, depending on the finenes sof the spray and the size of the tops.

More detailed information may be obtained by writing to G. C. Cunninghame, Dominion Plant Pathological Laboratory, Fredericton, or by writing to the Department of Agriculture, Ottawa, for Circular No. 10, "Late Blight and Rot of Potatoes."

Twice a Day For Half the Year

SOMEONE has to attend to the furnace; most people look on it as an irritating, dusty job. It need not be. It is not, if you have a Sunshine Furnace. **Shaking down the Sunshine Furnace does not raise a dust.** The fine ashes are drawn up the chimney; there is never that fine sprinkling of dust that lights on everything in the basement, and even floats up through the house. No. That is one thing the owner of a Sunshine Furnace never has to contend with. The Sunshine is as clean as a piece of furniture.

There are extra sturdy grates that turn with a long handle to crush with ease the hardest clinkers. A slight rocking that hardly requires stooping cleans down the ashes. The ashes fall as the grates are shaken, for the sides of the fire-pot are straight. This saves bother—and heat; because if ashes bank up around the fire-pot they stop the radiation of heat. The ashes come out in a big ash-pan. There is no shovelling or spilling ashes about.

And the door is large, as it should be for convenience in firing up. Or if need be, a large chunk of wood will go through this door. The dampers can be operated from the rooms above. This saves you the nuisance of running up and down stairs to shut off the drafts and open up the check damper.

McClary's Sunshine Furnace

Would you like to have definite information about the cost of installing a Sunshine Furnace in your home? Send the coupon for our booklet "Sunshine." At the same time if you wish to know what it will cost to heat your own home, our Heating Engineer will tell you. He will show you how to plan the distribution of heat so as to get the utmost warmth from the coal you burn. No, there is no charge. Simply address him at

Kindly send me without expense on my part:—

1. Your booklet on the Sunshine Furnace.

2. Also forms for filling out, so that your heating engineers can tell me how to order and install a system that will properly heat my home.

MARKET FOR HAY IN CUBA

Mr. J. C. Manzer, Special Representative of the New Brunswick Government in Havana, has forwarded to the Department the following account of the hay trade in Cuba. The importation of hay into Cuba is increasing year by year. The following is a list of the importations during the years 1912-1915:

	Tons
In 1912 Cuba imported	15,870
In 1913	14,864
In 1914	18,536
In 1915	23,331

Of these amounts:

	Tons
1912—	
United States supplied	7,741
Canada supplied	7,769
1913—	
United States supplied	10,792
Canada supplied	3,617
1914—	
United States supplied	13,336
Canada supplied	3,956
1915—	
United States supplied	21,448
Canada supplied	1,717

Before the war Canada supplied 50 per cent of the hay to Cuba, while the United States furnished about the same quantity. Last year, as a result of war conditions, the Dominion only supplied Cuba with 7 per cent of her requirements, while the United States furnished 90 per cent.

Quality of Hay Required

A considerable quantity of these hay importations are coming here by way of Baltimore, New Orleans, and other southern ports. The flaflvflour is not as good as well cured hay grown in the north. For this reason when Canadian dealers are again in a position to supply this market they can secure a large share of Cuba's hay trade. Cuba buys a limited quantity of high grade hay, but the bulk of the importations are what our dealers would call good No. 2 Timothy. Clover hay is not in demand here. Clover mixed hay is sold in considerable quantities, but should not contain more than 20 per cent of clover, which must be good and bright.

The Size of Bale Most Favored

The size of the bale best suited to the Cuban trade is 17-inch by 22-inch by 3 feet long, and weighing about 170 pounds to the bale. These will run about twelve bales to the ton. This size of bale is favored by the transportation companies, as 100 tons of hay running twelve bales to the ton will take up much less space than lighter bales running thirteen or fourteen to the ton. These bales should be tied with three No. 12 wires, with tags inserted under the wire showing weight of bundle as well as shipping mark. A shipping mark easily identified on each bale is essential to prevent lots getting mixed.

Transportation and Price

On account of the heavy demand for steamer space for less bulky classes of freight it has been very difficult to secure shipping facilities for hay during the last few months. As a result, the price of hay in Cuba has been steadily advanced. Good No. 2 Timothy hay is quoted today at $34 and choice Timothy at $40 per ton.

Cows require salt in summer as well as in winter.

English Apple Market During 1915-16

Hints for the 1916-17 Packers

By J. Forsyth Smith, Fruit Trade Commissioner Leeds, England

General Market Conditions

At the beginning of the apple season of 1915-16 the trade was generally very optimistic as to the prospects of prices for good fruit landed in favorable condition, as the main apple consumption depends upon the prosperity of the working classes, and all classes of labor were fully employed at wages considerably higher than normal, and able and willing to buy apples freely. It was also realized that the short crop, restricted shipping space, and high freights would lead to a limitation of supplies, which would help to maintain prices. In general, it may be said that these expectations have been realized, and throughout the season reliably packed barrel apples, sound, and of high-grade standard, have brought excellent prices, though inferior or slack-packed fruit has frequently fallen to an unprofitable level. The demand was, however, scarcely as strong and steady as had been anticipated, the Christmas demand being especially disappointing. The holiday demand slackened off very much earlier than usual this year, on account of the congestion in railway freight traffic, country buyers not caring to take the risk of their purchases failing to arrive in time for Christmas selling, and of having on hand large quantities of a perishable commodity during the comparatively slack weeks of the opening year. The December supply also was not very well timed, nearly half of it arriving after the middle of the month, and much of it being still further delayed by slowness in discharging, due to dock congestion, shortage of dock and cartage labor, etc., so that it could not be offered for the Christmas trade.

The prices for boxed apples have scarcely been up to expectations. At an early date it became apparent that, while the prosperous working classes were ready to buy the normal quantities of apples, they were quite content to buy the cheaper barrel apple, and did not care to pay the extra price asked for apples in boxes. The effect of war conditions, increased cost of living, increased income tax, etc., upon the wealthier class was such as to induce a strong preference for the cheaper fruit. The restriction within the smallest limits of banquets, dinners, and similar public functions also had a noticeably adverse effect on the demand for boxed apples. The apple crop in California, very largely made up for the shortage in the northwestern states, and many British dealers, after speculating rather daringly in California Newtowns, were obliged to reduce their stocks at very low figures. As a result, therefore, the box apple market during the months of heavy shipment was far from satisfactory.

Ontario Barrel Apples

There were some justifiable complaints by the trade during the heavy shipping months of November and December, especially as to the inferior quality of many of the Ontario apples received. This was apparently due to the tendency, so natural in a short crop year, to make use of many apples not considered marketable in a year of average or large output, and to pack somewhat too closely to the minimum of the Inspection and Sales Act requirements. In many cases too little attention was paid to maintaining No. 1 size and color requirements. Some No. 1 Golden Russets were also observed with a plentiful sprinkling of spot marks. A more serious mistake was the shipping of scabby No. 3, many of which, especially Golden Russets and Greenings, reached the market in such a wasty condition as to return no more than 5s. to 10s. Such lowering of standards is greatly to be regretted, as, with high ocean freights and increased handling charges, many shipments must have represented a direct loss to the shipper, besides having a most unfortunate effect on Canadian prestige on the market. In spite of this criticism of certain inferior packs throughout the season, there have been a number of reliable shippers whose output has been all that is to be desired, and who have commanded top prices wherever their apples have been offered. Ontario apples were sent very largely to Glasgow, where they are highly appreciated, though fair quantities were sold at Liverpool and a few in London and in Manchester.

Nova Scotia Barrel Apples

London was the principal market for Nova Scotia apples, though Liverpool also disposed of a fair quantity, and Glasgow a few. The London market was the least satisfactory of the primary receiving centres of the United Kingdom, the situation here being much more affected by the English apple crop than any other point. Usually the effect of the English apple crop upon market prices is pretty well over by the middle of November, but this year railway traffic difficulties were such that many growers acted upon the advice of the Board of Agriculture and stored their apples during the early part of the season, offering them for sale in considerable quantities during the weeks before Christmas.

The criticism of Ontario apples applies also to a number of packs of Nova Scotia apples. This is especially so in the matter of scabby No. 3 apples. It was also true, in the case of the Nova Scotia apples, that, although handicapped by the season, reliable packers were able to send forward a grade and quality of fruit that were very much appreciated, and that usually commanded the best prices. Nova Scotia shippers, in many cases did not pay sufficient attention to placing the various varieties on the market when they are at their prime. This was especially the case with some shipments of Kings in December and of Starks and Baldwins later on, which reached the market with a large percentage of slack and wasty parcels, due to the fact that the apples were long past their proper season. Causes of delay over which the shipper had no control may have had something to do with the holdover, which would perhaps be justified by the hope of higher prices on the later market. It is clear that the chances are nearly always in favor of sound apples bringing higher prices on a low market than wasty ones on a high market. The risks of deterioration are too great to be taken except for the best of reasons.

Canadian Boxed Apples

British Columbia box apples have only reached the market in small quantities this season, something over 8,000 boxes having been distributed between London, Glasgow, and Manchester. In general they reached the market in excellent condition, except in the case of Cox's Orange Pippins for the London market, many of which were soft and wasty and had to be sold at greatly reduced prices on this account.

The varieties were mainly Yellow Newtowns, Spitzenbergs, Jonathans, and Rome Beauties. The English Cox's Orange Pippin is very popular on the market, and as the supply is small in comparison with the demand British Columbia Cox's Orange Pippins of reasonably good color that can be laid down in good condition are assured of excellent prices. The past season, however, apparently showed that there is likely to be some difficulty in placing the larger sizes of this variety on the market in good condition. Shippers are therefore advised to ship the smaller sizes only. The English Cox is a small, well-colored apple, and small, well-colored apples of this variety from British Columbia are greatly superior in market value to those that are larger, softer, and below standard as to color. The Yellow Newtown is one of the most important of the imported varieties, but, with this exception, red varieties are preferred, Jonathans, Spitzenberg, and Winesaps all being in good demand. The Grimes Golden sells only with difficulty. Red varieties are especially called for early in the season, while the English crop is supplying the uncolored varieties plentifully.

Buyers complained of the size of many of the British Columbia apples on the market last season. The demand is for sizes from 125 to 163, and during the winter months very good prices have been given for apples over the 200 count. How size preference affects auction prices is clearly indicated in the following illustration, representing the prices offered in Glasgow for Extra Fancy Washington Winesaps on January 14, 1916:—96, 9s. 6d.; 113, 10s.; 125 to 138, 10s. 6d.; 150 to 163, 10s. 9d.; 175, 10s. 6d.

In the past the British Columbia export of apples to this market has been too small to make any definite impression on the trade. A continuous and dependable supply regularly moving through certain definite channels is required before a demand for British Columbia apples can be built up among British buyers. Washington and Oregon apples are looked after by a sales representative residing in London, and have been offered so steadily and continuously that they are well and favorably known on the market. British Columbia should not delay too long in adopting an aggressive export policy designed to prepare these markets to receive the larger quantities that must needs be sent here when its orchard output approaches its maximum.

About 20,000 boxes of Ontario apples, and nearly 4,000 Nova Scotia box apples, were on the market last year. Some excellent packs were inspected in Glasgow, but many others seen were very far from the standard of perfection in grading and packing that has given the western box apple a distinctive place on the market. The sizing especially was frequently very poorly done, resulting in slack packs, and there was often a lack of uniformity as regards color requirements. There is undoubtedly a certain field for the expansion of the box packing of eastern apples, but it would be a mistake to pack in boxes any but the best apples of the best varieties. A considerable improvement in the standard of grading and packing is also necessary.

Channels of Distribution

The different methods of securing distribution for his apples on the British market, which are open to the Canadian shipper, are:

1. Consignment to the wholesale apple auctions at the primary receiving centres, Liverpool, London, Manches-

ter, and Glasgow, for sale on shippers' account. 2. Consignment to wholesalers at the same primary receiving points, who sell by private sale on shippers' account. 3. Consignment to wholesalers at secondary receiving centres such as Leeds, Newcastle, Aberdeen, etc., for sale on shippers' account. 4. Sale direct to wholesalers at primary or secondary centres, at a price f.o.b. Canada, on the basis of cash against documents. 5. Distribution through a resident sales representative of the shippers.

1. The Auction Sales.—Much the greatest quantity of apples passes through the apple auctions, and they furnish a very valuable channel of distribution. Their advantages are: Quick distribution (15,000 to 45,000 barrels per week in normal times); the fact that prices are settled by the competition of a considerable proportion of the largest buyers in the country; the special opportunities this offers for securing premium figures for packs known to be reliable and of high standard; the openness of the competition and the facilities thus afforded for verifying returns made to the shipper; the comprehensiveness of the buying capacity concentrated in an auction salesroom, representing as it does both high and low class demand, and thus furnishing an outlet at some price for the inferior grades and marks as well as for the best, for slack and unsound fruit as well as that which is in the best of condition, for uncommercial as well as commercial varieties. The main disadvantage is that the brokers' interests are rather in the direction of handling the largest possible number of barrels than in securing the best possible price for any particular lot. There is only the comparatively slight inducement of competition among the brokers for business to induce them to hold for more favorable prices. On the whole, however, a reliable packer with a reputation for grade and quality will be well satisfied with his apple auction dealings. The prices received are quite likely to be as good as would be paid anywhere else in the market. It may be said also that in many cases the importers, acting in conjunction with the brokers, have their own agents in Canada, who are prepared to make satisfactory advances on goods consigned, or frequently to purchase outright.

2. Consignment to Wholesalers at Primary Points.—The value of this method to the shipper depends very largely upon his finding a good reliable firm to deal with. Such a firm, long established and with good connections, will usually be able to secure the full value of the fruit, though possible prices at a primary receiving point are very largely determined by the auction prices.

3. Consignment to Wholesalers at Secondary Points.—Some consigning is done direct to wholesalers at secondary points, and some shippers have had very satisfactory results in this way. Usually, however, it is rather difficult to gauge the quantity that such secondary points can use satisfactorily, the interests of the wholesaler constantly tempting him to ask for more apples than he can dispose of to the best advantage. It is believed that, for sales on shippers' account, the auctions will generally give the best results

4. Direct Shipping.—An investigation is now in progress as to the possibilities of direct shipping on a f.o.b. basis to the wholesalers at the secondary distributing centres. Under the abnormal conditions created by the war, with high freights, limited steamer accommodation, delays in loading and unloading, dock congestion, and labor shortage difficulties, the wholesaler in many cases considers the risk too great for satisfactory direct buying business. He considers that it pays him better to buy according to his needs at one of the great auctions, apples whose condition and quality he can personally inspect. A short tour, however, of some of the principal Scottish secondary centres has made it clear that even in war time many wholesalers are willing to do business direct, on the basis of cash against documents. It is proposed, therefore, before next apple season opens to get into touch with the wholesale trade of most of the important cities of the United Kingdom, and to prepare a full report giving a list of wholesalers who are willing to deal direct, together with an estimate of their several requirements. This method of business, in which the wholesaler takes all the risks, will appeal especially to those shippers who prefer a fair but sure price agreed upon early in the season to top price possibilities as the season advances. It is only possible on a basis of mutual confidence, i.e., between an honest, reliable shipper and a fair and reasonable buyer.

5. Resident Sales Representative of the Shippers.—Business by this method is the most satisfactory of all, as the shipper's representative on the market is in a position to arrange for the distribution of the apples to the various markets, to dispose of them at auction when that course seems desirable, to withdraw them when the bidding is not satisfactory, to place them in cold storage when conditions warrant, to arrange private sales direct to the wholesaler, to discuss classification with auction brokers, to note the condition of the apples on arrival and make necessary adjustments, and in general to make sure that in no instance are the interests of the shipper sacrificed to the insistence of the ever-present buyer. The United Fruit Companies of Nova Scotia, the North Pacific Fruit Distributors of Spokane, Wash., and the Northwestern Fruit Exchange of Seattle, Wash., all have their own representatives on the market, and the results obtained have fully warranted this policy, which, however, is only possible where considerable tonnage is concerned.

APPLE AUCTION SALES ROOM, GLASGOW, SCOTLAND

Methods of the Apple Auctions

A somewhat detailed description of the methods of handling apples on the wholesale apple auctions will doubtless be of interest to the Canadian shipper:—

The apples are received on the quay as they are discharged by a quay foreman in the employ of the broker, who sees that they are classified in lots according to mark and grade, and also according to conditions as tight, slack, slightly wet, or wet. On the report of this employee, checked, as occasion seems to warrant, by personal inspection by the broker, the apples are entered on printed catalogues, clearly indicating the origin of the fruit (Nova Scotia, Ontario, Virginia, Maine, etc.), the steamer on which it has arrived, the name of the packer or shipper, the number of barrels or boxes in each lot, and the judgment of the broker's representative as to their condition. The apples are arranged in order on the quay, and at some time before the sale the larger buyers make a practice of sending down representatives, who examine the various lots and make detailed note of the pack, color, grade, and quality of each, which they report to their employers. Buyers who cannot afford to have such a detailed inspection made by their own employees avail themselves of a similar report that is made and distributed to them by one of the master carters of the city. As a result of this system, when a buyer bids at the sale he has in mind in making his offers, not only the information furnished by the brokers on the catalogues, but also the judgment of his own employees as to the relative value of the various lots. A premium is thus placed upon good pack and grade, and while poor lots may be neglected, good ones have the benefit of an eager competition that brings top prices.

Some 200 to 250 buyers assemble in the Commercial Sales Room, where the seating is arranged in successive tiers as in a theatre. These buyers comprise wholesalers from Liverpool and from all considerable towns and cities in the north and middle of England. The auction is closed except to those who are specially admitted by license, and wholesalers who are not members must do their buying through a member, who charges a commission of 3d. to 6d. a barrel for his services. In the centre of the room there is a trap door communicating with a basement beneath, and as each lot is offered for sale a sample barrel or box, opened, is sent up from below for inspection. As the buyers do not leave their seats, this

Cabbage Root Maggot and Its Control in Canada

(Phorbiabrassicae Bouehe)

By Arthur Gibson, Chief Assistant Entomologist, and R. C. Treherne, Field Officer.

(Continued from last issue)

Preoviposition Period

The preoviposition period, or, in other words, the period from the time the fly emerges from the puparium until its lays its eggs upon the plants, is an important consideration in view of the fact that it has been recently demonstrated that the adult fly of a closely allied species may be destroyed by poisoning during such period. Under insectary conditions in British Columbia flies (3 males, 6 females) which emerged from puparia on July 19 were placed in a glass breeding jar which covered a small potted cabbage plant. On July 28 all the flies were dead, but on examination on the morning of July 29, 75 eggs were taken from the stem of the plant and 8 freshly hatched maggots. The presence of the maggot indicated that eggs must have been laid at least four days previous to July 28. The preoviposition period, therefore, under such conditions was about six days. It is interesting to record here that 73.5 per cent of these eggs laid in confinement by flies emerging in the laboratory were fertile. The newly hatched maggots were immediately placed on a young cabbage plant, and on August 16 a few maggots had attained the length of 3 mm. (one-eighth of an inch) and one puparium was found on August 24. In other experiments we were also successful in inducing flies to mate in confinement and deposit eggs. Further observations, however, must be made on the preoviposition period of the fly in order to definitely determine its value as regards the control of this insect.

Hibernation

From a study of the life history of the insect we assume that the stage in which it hibernates in Canada is usually the puparium stage. This agrees with the published statements of other investigators. Fletcher claims that the insect also hibternated as larvae in old stems and roots which have been left in the grounds. In our observations at Ottawa, Ont., in the spring of 1904, we found in a turnip field, the crop of which had not been harvested, a single larva, which we considered to be that of Phorbia brassicae, near an old root in company with many puparia of that species. Unfortunately, however, the larva was injured in collecting, and after a few days it died. In 1911, on November 9, we found at Ottawa full-grown larvae near old cabbage plants. This would bear out the supposition that the insect may hibernate in the larval form in eastern Canada. In the Ottawa district heavy frosts occur all through September, October, and November. By the middle of this latter month the first temporary fall of snow has taken place, and winter in reality begins in late November or early December, when the ground freezes up.

At Agassiz, B. C., larvae have been found in the first week of November (1915) in sizes varying from 2 to 4 mm. long. In December (1913 and 1914) full-grown larvae were also found at this latter locality in the roots of old cabbage plants. Climatic conditions at Agassiz, B. C., differ from those of eastern Canada, the rainy season commencing in autumn, and the real penetrating cold weather usually not beginning until about the end of December. Other students have claimed, in addition, that the insect hibernates in the adult stage, but all investigators agree that the stage in which the insect regularly hibernates is the puparium stage.

The following shows the number of puparia collected from the field at Agassiz, B. C., in 1915, on the dates mentioned:

August 27—Number of puparia collected, 70; flies emerged, 57; missing or parasitized, 2; sound puparia left to pass the winter, 11.

September 1—Number of puparia collected, 75; flies emerged, 43; missing or parasitized, 6; sound puparia left to pass the winter, 26.

September 25—Number of puparia collected, 65; flies emerged, 2; sound puparia left to pass the winter, 63.

September 30—Number of puparia collected, 72; flies emerged, 0; sound puparia left to pass the winter, 72.

Totals—Number of puparia collected, 282; flies emerged, 102; missing or parasitized, 8; sound puparia left to pass the winter, 172.

From this it will be seen that 61 per cent of the above puparia will pass the winter in the puparium stage, while only 36 per cent gave forth the adult flies. As previously mentioned in this bulletin, no flies emerged from any of our outdoor breeding cages after September 27. In this connection we may state that at Agassiz, B. C., on September 28, 29, and 30, 1915, a field examination was made of 78 cabbage plants around which were found 124 empty pupal cases from which the flies had emerged, and 96 sound and apparently healthy puparia.

The adult flies which emerge during September may be found hovering around late cabbages and cauliflowers, old cabbages, stalks, etc., in the field, and may be observed actively at work laying eggs. Egg deposition by flies which developed in the autumn, as already stated, may continue until October. Unfortunately, all of the flies reared from the September puparia, and which were under observation in our outside laboratory, died within three weeks, although provision had been made in the hope that some might hibernate. While acknowledging the possibilities that under suitable conditions adult flies may winter as such, our experiments have failed to prove the fact.

THE IMPORTED ONION MAGGOT

The Imported Onion Fly, Hylemyia antiqua Mg. (Phorbia ceparum Mg.), has for many years been a regularly occurring pest in Canada. It is injurious in every province from Nova Scotia to British Columbia.

Life History—The Egg

Description.—Similar in shape a appearance to the egg of the Cabbag Root Maggot Fly. Length 1.2 m.m., white in color, with distinct ridges. The groove on one side is by no means so deep and conspicuous in this species as in Phorbia brassicae and only extends from about one-fourth to one-half the length of the egg.

Duration of Stage.—The length of the egg stage ofthis insect varies as in the case of the Cabbage Root Maggot Fly. The general statement has been made that the eggs hatch within a week. The actual period, however, will vary according to climatic conditions. Severin-Severin (11) recently recorded that under field conditions in Wisconsin the icubation period of eggs deposited by the first geeration of flies, in early June, varied from three to four days.

Larval Emergence.—We have not actually noticed any larvae of the Imported Onion Maggot emerging from eggs, but this act is undoubtedly similar to other species of this group of flies, the young maggots of which emerge from the blunt or head end of the egg.

The Larva

Description.—When full upon, about 10 mm. in length, white in color, cylindrical in shape, blunt at one end and tapering to the head, in general very similar to the Cabbage Root Maggot. The blunt end is rather rounded, not so abrupt as in the latter larva, and the fleshy tubercyles at this end near the spiracles are arranged differently. In the Cabbage Root Maggot the two central tubercles are bifurcate, or two pointed, and in the Imported Onion Maggot they are single pointed. Near these there are also in the latter species a pair of small additional tubercles. The two black, hook-like jaws and the fan-like spiracles near the same are similar to such organs in the Cabbage Root Maggot.

Duration of Stage.—The length of the larval stage ranges from two to three weeks in summer. Severin-Severin have stated that in seeded onions from the previous year the development of the maggots was often prolonged, in some instances requiring from four to five weeks.

Pupation.—When the maggot is fully fed and has reached maturity it changes to a puparium. This may take place in the soil close to the plant or later in the season between the outer fleshy layers of the onion near the place where the larvae have been feeding. Puparia have ben found in the soil at Ottawa, Ont., at the end of August, 3 inches below the surface of the soil. In December we have found the puparia from one-half an inch to three inches beneath the ground. On December 6, 1915, a number of living larvae and puparia were found just beneath some old onion plants which have been pulled and placed on earth in an outdoor insectary, from a portion of which the screen windows had been removed. This is the only occasion on which we have found living larvae so late in the year, and as winter had already set in, the ground being frozen hard outside, there is every reason to conclude that these larvae would have wintered successfully and changed to puparia the following spring. In Canada we have no records of the insect hibernating in the adult form.

The Puparium

Description.—Similar in general appearance to the puparium of the Cabbage Root Maggot. In length it varies from about 5 mm. to 7 mm. (rather more than one-quarter of an inch), and in color from light to dark reddish brown. As is the case with other similar puparia, the larval characters are retained.

Duration of Stage.—At Agassiz, B. C., in 1915, the puparium stage varied in mid-summer from 14 to 26 days. In eastern Canada in the same season of the year the average length of the stage is about two weeks. The winter is passed usually in the puparium form, from which the flies do not emerge until the following spring.

The Adult

Description of the Male.—The Imported Onion Maggot Fly is slightly larger than the Cabbage Maggot Fly. The body of the male is of a light greenish-gray color, the legs being darker. The body and legs bear numerous black bristles of varying lengths. On the back of the thorax are four indistinct dark colored bands, and there is also a distinct blackish band down the centre of the abdomen. The upper portion of the femur of each hind leg lacks the conspicuous cluster of bristles so characteristic of the Cabbage Root Maggot Fly.

Description of the Female.—The general color of the female fly is similar to that of the male. The eyes in this sex are widely separate, not close together, as in the male, and the abdomen is more pointed. The bands on the thorax are very faint, and in some specimens there is no band down the centre of the back of the abdomen.

Proportion of Sexes.—In our breeding experiments at Ottawa, Ont., in July, 1913, the sexes reared were about evenly divided, the number of female flies being slightly in excess of the number of male flies.

Development

The development of the Imported Onion Maggot throughout the year is most probably very similar to that of the Cabbage Root Maggot. The flies which develop from overwintering puparia emerge in the spring, the exact period varying according to climatic conditions. At Ottawa, Ont., in the third week of May, 1915, we observed the flies in numbers in an onion field. No eggs were deposited on or near the plants until June 4, when several clusters were observed. Such eggs deposited in spring develop into the first brood of maggots. In years of abundance the maggots may be found until late in the autumn, so there are probably about three breeds of larvae in a season.

Habits—Food Plants

The Imported Onion Maggot, under natural conditions, so far as we know, only attacks the onion plant. The various varieties are liable to infestation at any size during the growing season, but in most years it is the young plants in June which are largely destroyed.

Nature of Injuries

It is only in the larval, or maggot, stage of course that injury to onions is effected. When the young larvae hatch from the eggs they at once begin to work their way down within the sheaths until they reach the young forming bulb in which they feed and ultimately reduce the same, particularly the lower portions, to a rotten mass. Later in the season, when the bulb is well formed, the injury is usually confined to the lower half of the bulb, which is often entirely eaten out. We know of only one instance, at Ottawa, where the maggot was found in a stem of onion above the surface of the ground. As already mentioned, the important injury in eastern Canada in most years is specially noticed in June. When young onion plants at this time are seen to droop, the leaves appearing wilted and discolored, it will generally be found that the maggot is responsible for such injury. Toward the end of July, and later, when the bulbs are well formed, many larvae will be found feeding together in a single bulb. In one bulb examined at Ottawa, Ont., on July 18, 1913, there occurred 29 maggots. In another received from western Ontario on September 28, 1915, 67 larvae, in all stages, and 12 puparia were present.

Reproduction—Oviposition

The Imported Onion Maggot Fly deposits its eggs on the young leaves of the plants, or later on the outside of the stem near the soil. Eggs may even be laid on the soil. The first eggs of the season of 1915 were observed at Ottawa, Ont., on June 4. On one plant 8 eggs were seen, on another 6, on another 20, and from still another 52 were taken. On other days following many other eggs were observed. Some of the eggs were one and one-quarter inches away from the

WHO WAS THIS PRODIGAL FATHER ?

A certain man had two sons, and the younger of them said to his father: "Father, give me the portion of thy time, and thy attention, and thy guidance which falleth to me." And he divided unto them his living in that he paid the boy's bills, and sent him to a select preparatory school, and to dancing schools, and to college, and tried to believe that he was doing his full duty by the boy.

And not many days after, the father gathered all his interests and aspirations and ambitions and took his journey into a far country, into a land of stocks and bonds and securities and other things that do not interest a boy, and there he wasted his precious opportunities of being a chum to his own son. And when he had spent the very best of his life and had gained money, but had failed to find satisfaction, there arose a mighty famine in his heart, and he began to be in want of sympathy and real companionship. And he went and joined himself to one of the clubs of that country, and they elected him chairman of the House Committee, and president of the club, and sent him to the legislature. And he fain would have satisfied himself with the husks that other men did eat, but no man gave unto him any real friendship. But when he came to himself he said: "How many men of my acquaintance have boys whom they understand, and who understand them, who talk about their boys and associate with their boys and seem perfectly happy in the comradeship of their sons, and I perish here with heart hunger! I will arise and go to my son and say unto him: 'Son, I have sinned against Heaven and in thy sight, and am no more worthy to be called thy father. Make me as one of thy acquaintance.'" And he arose and came to his son. But while he was yet afar off his son saw him and was moved with astonishment, and instead of running and falling on his neck, he drew back and was ill at ease. And the father said unto him: "Son, I have sinned against Heaven and in thy sight. I have not done my duty by you, and I am not worthy to be called thy father. Forgive me now and let me be thy chum." But the son said: "Not so. I wish it were possible, but it is too late. There was a time when I wanted to know things, when I wanted companionship and advice and council, but you were too busy. I got the information, and I got the companionship, but I got the wrong kind, and now, alas! I am wrecked in soul and body, and there is nothing you can do for me. It is too late, too late, too late!"

The moral is plain. Fathers, be your sons' closest companions. You can if you will.

COMMUNITY SPIRIT

We are coming to see more and more that great natural talents or splendid opportunities are not of so much benefit to mankind unless they are accompanied by the desire to serve.

Perhaps we notice this mostly in our people who fill public offices. In the western country our school teachers are only doing about half their duty when they teach the school. We need educated leaders of thought in every community. Where can we find them if not in our teachers and ministers?

Our teachers need to visit the homes in their district. They will get as much pleasure as they give. Instead of arranging to spend every week end in the nearest town or village, let them arrange to spend their Saturday afternoons visiting the homes of the different pupils in succession. Word could be sent a week ahead to the mother, so if she did not wish to entertain the teacher that Saturday she could arrange for another time. Too many teachers go into a district and only meet with the people who especially invite them to their homes. In this way the others lose the benefit of the teacher's presence. And the teacher often misses knowing the choicest spirits in the community.

The teacher brings into the district a store of freshly acquired knowledge. We all should avail ourselves of this. To do so we must invite the teacher to our homes. If he or she is a critical person, who turns up his nose at a children-filled home, littered with the disorder which all children make, sensitive mothers hate to venture the invitation.

It is a strange thing the way people turn up their noses at a lot of little children. Especially if they are not well dressed. A mother feels quite apologetic taking a number of little children to almost any public gathering. They are mostly regarded as little nuisances, to be kept as much in the background as possible. Any one who lives with them understands how difficult it is to keep children in the background. So the mother has a guilty feeling of being rather unwelcome with her little flock. Yet a mother is doing her duty by her community when she furnishes several good children, feeds them, clothes them, and trains them. She is providing the material for the training. And the teachers, ministers, and bank officials who have the leisure should provide the helpful training.

We do not mix up together enough in our little communities. Each one seems to live to himself. Some of us have so much to do in our own homes. Others, who have leisure, like teachers and bank workers, seem to prefer to spend it in playing tennis or golf, to using their talents for the community.

Both of us are partly to blame. The busy mother should make time to invite the lonely teacher or bank boy, perhaps away from home for the first time, to her comfortable home. The invited guest must meet this real attempt at hospitality halfway, by graciously accepting, and then by taking the spirit of kindness in which it is offered into account, and not by criticizing the home or its contents.

We need to meet on common ground. Often we can do this in the church and Sunday school. We should meet at the school house during the week, too. Baseball and football could be played on the adjacent grounds during the summer. The mothers of the players, sisters, or wives can go along to watch the play. When the wives go the babies have to go, too. And this is quite all right. The babies are the men and women of the future and have a right "to a place in the sun," as Kaiser Wilhelm says.

The women have their work for the soldiers. Usually they meet once or twice a month. It would be well to have a meeting in the evening once in a while, when the work is not too strenuous, so the men can come too.

When the women folk take the cream to town they should visit the town women while the cream is being tested. It does both women good to meet, and promotes a good feeling between town and country. The town woman should give a hearty welcome no matter what she is doing. Work will wait, but if the country friend once feels that she has come at an inopportune time she is not likely to repeat the visit or to try to visit another woman.

Interests in common are a great source of community spirit. When there is a social in the country the town folks should make it their business to go and help, at least with their presence and purchases. The country people are always good to come in and help with functions in town.

POTATO ALCOHOL INSTEAD OF GASOLINE

Good use for distilleries and breweries which are being put out of business by the "dry" vote and prohibition: Make potato alcohol, denatured, for use in the arts and industries and as fuel. There is an unlimited market for potato alcohol in place of gasoline for automobiles, trucks, tractors, stationary and movable engines, and all other fuel purposes for which gasoline is employed. There are many other industrial ways in which potato alcohol may be employed, as in paints, varnishes, etc. The denatured spirits are of such a character that it is practically impossible for them to be used as a beverage. Breweries and distilleries can afford to pay a price for potatoes that will make this crop compare with wheat in profit to the grower. This matter is of the largest importance to the farming and manufacturing interests of the whole country, for breweries and distilleries which heretofore have turned out intoxicating liquors can be utilized as a market for a greatly increased potato crop, producing therefrom fuel spirits which may be sold in competition with gasoline.

An attractive letter head on good paper gains a hearing for anything one may care to write. Every breeder should try to adopt some distinctive, modest design to use on his stationery. Eventually it becomes a sort of trade mark. It is worth far more than it costs.

A P. E. I. Farmers' Sheep-Raising Experience

Editor The Maritime Farmer:

Your readers appear to take a great interest in my farming operations, such as they are, and my old-fashioned methods, judging from the number of letters I have received, some asking for my photograph, others for a picture of my premises. Neither my own photograph or that of my premises would make a very good picture. I suppose it is because I am an old woman. I will endeavor to answer through your paper some questions about my sheep, which appear to be of the greatest interest.

I may say that my flock is a small one of grade Shropeshires, though I think the Leceisters would be more profitable now that wool is so high. They are payig 50c a pound here for washed wool, so that the income from the fleece is perhaps the most important. I had a Leceister ram a few years ago that sheared 14 lbs. of wool. At 36c a lb. that flee.ce would be worth today $5.00, so that if wool keeps up in price I think it would pay to have Leceisters, as they yield so much more wool than the Down breeds. while the lambs in the fall would likely fetch as much. But my objection to the Leceisters was that they were hard to keep, not being nearly so hardy as the Shrops and South Downs.

"Do I have trouble with sheep jumping the fences?"

Well, I should say I have! That is the great objection to sheep keeping. At present I have all my sheep "blocked," or tied in pairs. In small fields it seems impossible to keep the sheep from jumping. Sheep want wide range. For several years I had our sheep in a 50-acre pasture rented from my next neighbor, and though the fences around that field were miserably poor the sheep never attempted to jump. Unless a person has wide range for his sheep he should not attempt to keep them at all. Small fields and restricted range do not fit in with sheep raising.

"What does it cost you to keep a sheep a year?"

As to this question, I do not know exactly, but I feel sure that the fleece pays for their keep, and the lamb is to the good and clear profit. If I get $6 for my lambs this fall I will consider that clear profit for the keep of the ewe and the raising of the lamb.

My fleeces this year, with the high price, 50c a pound washed, will more than pay for the annual keep. I said in my letter that I feed no hay. The oat straw I cosider worth nothing, as it has no market value. The turnips I feed I do not think cost me 2c a bushel to raise. I can grow potatoes almost as cheaply as turnips, and easier to grow, too, because there is no hand cleaning needed as in turnips, and I have such difficulty in getting help to clean and thin out my turnips. It is almost impossible now to get a man to get down on his knees to clean and weed and thin out turnips. We have a red variety of potatoes here that there is only a market for at certain times, but which yield big crops. I can grow 300 bushels of potatoes about twice as easily as 600 bushels of turnips on the same or like acre, and potatoes are nearly twice as nutritive as turnips. I think your various readers and correspondents are feeding too many roots and grain. It does not take much to keep a healthy flock of ewes through the winter and spring. I feed only about a half bushel of roots to, say, 10 sheep, and I think this is enough. I feed only an average of one-half lb. of oats a day during the six months of winter and spring. In very cold weather I do not feed any roots at all. I estimate that I feed on an average six bushels of potatoes and turnips and 90 lbs. of oats (average price 40c at threshing time), value $1.05. I do not think it costs me 2c a bushel to grow roots, but counting the labor of slicing them we will say 5c a bushel. This is 30c for the roots fed. Thirty and $1.05 makes $1.35 as the actual cost of the grain and roots fed per head during the six months' wintering. As to cost of pasturing, I do know that sheep should be charged anything for pasturing. Sheep, you know, "has a golden hoof." But the cost of FENCING is the chief item. This is impossible to even fairly estimate. As my fleeces this year averaged $2.50, this leaves a margin of $1.15 to pay for keep-up of fences, personal care, and I suppose interest, which is much more than enough to cover all those items. So I am quite safe in saying that the lamb in the fall at, say, $6.00 is clear profit.

Some people think sheep require little or no care. This is a big mistake. I have my sheep under my eye every day in the year, and I need to. At this time there are caked udders to be looked to; lambs not nursing, or lambs not taking all the milk from their dams. Ewes must be frequently milked, and ewes must be held for the lamb to suck. These things and many more occur every day. For these reasons I have my sheep run back and forth from the fields to the yard, and frequently around the house. In the heat of the day my sheep are lying around the yards, and they are in the shed every night. I think sheep require the most personal care of any animal on the farm, and if one is not prepared to give daily and constant oversight to his or her sheep they had better keep cows. Eternal vigilance is necessary to success with sheep. That's why there are so many failures with sheep. My neighbors talk jokingly about me and my sheep for never letting them out of my sight. "Nancy's sheep" is a by-word with them. But these same people, my good neighbors, cannot raise sheep. Less than a half dozen is the average around here. These people won't bother "fussing" around sheep. But the local papers are glad to print things about my sheep and my big profits from the sale of my wool and lambs. My lambs last fall weighed 135 lbs. on an average at selling time, and this was so unusual that it was in the papers. I do not wish to encourage anybody to go into sheep raising. My success with my small flock has no effect on my neighbors around here because they are all failures with sheep. I may say that my daughter is beginning to have good success with her sheep, "copying and following her mother's methods."

As to "What kind of fences?" I answer this by saying that I have no woven wire and little plain wire. I use the old-style rail or worm fence. The reason I use rails almost entirely is that I have thousands of them growing to the rear of my place a half mile away. If I use wire it will be close-woven wire.

In closing this letter I would say that if I were considerably younger, as things are, and forced to make my living on a farm, I would double my flock of sheep, for I think sheep raising very suitable work for a woman. True, there is work and bother about fences, and the fences must be closely watched, and one must be able and willing to at least temporarily repair them. I go over the fences every day, and always find low places and open places that must be at once repaired. The work is pleasant, and the profits in a year like this are phenomenal. There is probably none of our domestic animals compares with the sheep today as a money maker. They are also such innocent things, "the lamb of God," the emblem of purity. Abel was a keeper of sheep and offered "the firstling of his flock." Sheep are God's chosen animal. Bless them.

I almost forgot this question: Do I breed my spring lambs? Yes, I breed my lambs in the fall same as sheep. I do not believe in keeping a lamb two years for nothing. My yearlings this year have as good lambs as the old ewes, and plenty of milk for them too. Good strong ewe lambs in the fall should be bred.

(MRS.) NANCY McDONALD

Clover Seed Production in N. B.

For several years the officials of the Department of Agriculture for New Brunswick have been urging upon the farmers the necessity of producing more seed, especially of the grasses and clovers. Many thousands of dollars are sent out of the province annually which should be kept at home. In fact, it has been urged that this province, instead of being an importer, should be an exporter of seed. The tremendous rise in prices during the past few years has brought many farmers to realize the force of that which has been frequently urged by the officials.

The present season is proving one of the very best for the production of clover. Everywhere there are large stands of this plant. From several sections of the province prominent farmers have been writing to the department for instruction as to the best method of saving the clover plant. This work was to have been taken up by the Soils and Crops Division, but as both Mr. Newton and Mr. Reed, of this department, have entered military service, our plans did not mature.

On account of the conditions which exist this season, it was felt that something should be done along this line. The Honorable Mr. Murray has been looking for a competent man to carry on this work, and has succeeded in obtaining the services of Mr. O. C. Hicks, of Petitcodiac, a recent graduate from Macdonald College, P. Q. During Mr. Hicks' college course he specialized in cereal and seed work. He has spent the past few days visiting clover fields, and has presented his first report to the department. He states that he finds the growth of clover very general and of a very fine quality; but, upon examination of the plant, is of the opinion that, because of the excessive wet during the flowering period, the bees and insects necessary for the proper fertilization of the flower were not in general flight, with the result that there will not be a very large production of seed from the first growth, because of lack of fertilization. He recommends, however, that the clover fields be cut immediately and that a second growth be given every opportunity possible. If weather conditions are favorable, there should be a good production of seed in the second crop.

In the past whatever clover seed may have been saved in the province has been threshed with the ordinary threshing machine. As this machine will only partially thresh the clover, there is a very large waste. In order to save the larger portion of the seed produced it is necessary to thresh the clover with the regular clover huller. As this machine is quite expensive, and the work of producing clover seed is still in the experimental stage in this province, I have recommended to the Honorable Mr. Murray the purchase of a clover huller, to be operated by the department during this season for the actual cost of operation, on much the same plan as our ditching machine and limestone pulverizer are operated. I am pleased to say that the minister has accepted my recommendation and has instructed me to proceed along these lines.

I would be very glad to hear from farmers who have clover fields and who would undertake the production of clover seed. If sufficient farmers will undertake this production a clover huller will be purchased immediately and preparations made to assist in the threshing and hulling. For the benefit of farmers who are interested I would emphasize the following points:

First: The first crop of clover must be cut at once.

Second: All live stock must be kept off the mown fields, in order that the second crop may develop rapidly.

If those who care to undertake the work will write me, a representative of the department will be sent to inspect the plots, and if there is sufficient clover produced to warrant the sending of the machine into a community, the same will be done.—J. S. Daggett, Secretary for Agriculture.

A GOOD MARE'S DESCENDANTS

A farmer whose well-matched teams are the object of much praise disclosed the fact that nearly all his horses are descended from one 16-year-old mare. A remarkable similarity of type prevails throughout his work stock. They are all blacks and all of one stamp. All have clean-cut features, smoothly turned bodies, and hard, flat joints and cannons. The old mare is not quite so large as some of her offspring. She weighs about 1,600 pounds and stands 16 hands high. Her most impressive characteristics are a refined head, brilliant eye, stylish neck, deep chest, well-turned hips and croup, and legs of popular shape and superior quality. She has been a regular producer and has always been bred to big Percheron stallions. Her owner is an Illinois corn grower who keeps about one-third of his farm in mixed clover and timothy, where his horses graze when not at work. Last year he won the championship at the local colt show.

This is a typical example of the rather rare instances in which a high-class brood mare has been duly appreciated and suitably mated. It is surprising that so few cases of the kind are found. The good appearance of such a lot of horses is not the only advantage. These closely related horses are similar in disposition as well as in color and type. They look well any way they are hitched, and they work any way they are coupled or grouped in teams. Such a team is a source of continual satisfaction in performing the field work.

In founding such a desirable family of work stock this mare has undoubtedly been worth many times the price any one would have paid for her at any time in her life. She is only a grade mare, but her breeding capacity was fortunately recognized and fully utilized.—Breeders' Gazette.

The farmer and the farmer's wife are always busy. This may be made the excuse for leaving the cream separator unwashed. This is a filthy habit. The separator should be carefully washed after it has been used.

HORTICULTURE.

THE DIRECT SHIPPING OF APPLES

Buyers' Views of Direct Shipping of Apples

Although most of the Canadian apples sold on the British market pass through the wholesale apple auctions, a fair quantity is sold direct to the wholesalers at the secondary distributing centres. These dealers hold views almost equally divided for and against this method of doing business. Those who have been fortunate enough to get into communication with reliable shippers, careful in maintaining their standard of grade and quality, and sufficiently experienced to ship no fruit in an immature or over-ripe condition, or other than properly packed, are strongly, and in many cases enthusiastically, in favor of direct buying. Those whose experience has unfortunately been with dishonest, inexperienced, or undependable packers do not care to take the risks involved in long-distance buying, preferring to purchase according to their needs at the wholesale apple auctions, where the apples can be inspected and the grade and quality judged before bidding.

From the Shippers' Standpoint

It is believed that the comprehensive competition offered by the auction sales room is such that well-packed and graded apples (especially those that have acquired a special reputation for excellence), will bring as high a price there as is possible anywhere on the market. Many shippers, however, prefer to do business on a cash basis rather than to consign their apples for sale on their own account. They recognize that the price acceptable to a British wholesaler early in the season must necessarily be a safe one from this standpoint, and therefore probably lower than that which they might reasonably expect to receive if they took the risks themselves. But, as owners of a perishable product, they entertain constant suspicions of the honesty of commission selling on a distant market where they have no commercial representation; and, everything considered, they prefer a firm price definitely agreed upon before the apples leave their hands.

For the benefit of such shippers, interviews have been held with a large number of the wholesale apple dealers in the United Kingdom, and the statement below gives an estimate of the requirements of those who are interested in developing a direct business. These estimates have been made as conservative as possible, and in most cases, especially with box apples, the quantities could be increased if satisfactory connections were formed.

Mutual Confidence and Satisfaction Necessary

At the risk of repetition, it is desired to emphasize as strongly as possible that a permanent and direct business can only be built up on a basis of mutual satisfaction. Shippers who cannot guarantee their grade and pack had much better leave this business alone, as the British buyer cannot afford to pay good money for less than an assurance of getting what he has bargained for. It is of interest to note in this connection that the Fruit Branch of the Department of Agriculture are now furnishing copies of the reports of their inspectors on particular shipments, and such a report, covering, say, twenty-five to thirty barrels in a car, and attached to the bill of lading, will offer the buyer a degree of security that will be very much appreciated.

Financial Arrangements

Business is done on the basis of cash against documents. In a minority of cases the buyer opens a credit with a Canadian bank so that payment may be made in Canada on presentation of the bill of lading immediately the goods have been shipped. In most cases, however, a draft is attached to the bill of lading, payment to be made to the bank before the delivery of the goods. Whether one way or the other is adopted depends altogether upon the contracting parties, but in general it is believed that Canadian shippers will not find it difficult to secure any reasonable concessions from reliable importers on this side.

Apple Inquiries

In certain cases the willingness of the wholesaler to handle on commission is indicated in the Trade Inquiries. It is believed, however, that a commission business at small centres is not likely to prove satisfactory. It is difficult to gauge the quantities that can be absorbed at good prices at such a point; there are strong and varying local grade and variety preferences, and the demand is not comprehensive enough to bring the best prices at any one point for all varieties or grades likely to be offered; the dealer, interested principally in his percentage, is constantly tempted to overstate the consumption possibilities of his connection; there is no price publicity inducement to fair dealing on the part of the wholesaler as in the case of the auctions; and there is also likely to be some doubt as to the financial responsibility of the smaller firms. For these reasons, unless the shipper has good reason to believe that his connections are reliable, it is recommended that only a strictly cash business be done with the secondary centres. Consignments had better be sent to the large apple auctions.

In the Trade Inquiries the requirements of individual wholesalers are given. The figures represent, not the total quantities of apples handled, but the dealer's estimate of the quantities he is prepared to buy direct from Canada if prices can be agreed upon. The names and addresses of the inquirers can be obtained on application to the Commercial Intelligence Branch of the Department of Trade and Commerce, Ottawa.—J. Forsythe Smith, Leeds, England.

NEW BRUNSWICK FOREST SURVEY

Three field parties are now at work in New Brunswick, in connection with the forest survey and classification of Crown lands. The project is under the supervision of P. Z. Caverhill, Provincial Forester, subject to the general direction of the Minister of Lands and Forests. The size and importance of the undertaking is indicated by the fact that the Crown lands in this province comprise 10,000 square miles and return a direct revenue to the provincial treasury averaging more than $500,000 annually from timber alone, in addition to large revenues from the sale of hunting and fishing privileges.

The best agricultural lands are naturally along the valleys, where settlement has for the most part been concentrated. In some cases, however, settlement has extended to the uplands. Some of these lands are well suited for agriculture, but in other cases the settlers have apparently been attracted primarily by the timber or by the desire merely to locate a home, and have settled on lands wholly unfit for permanent agricultural use.

There is considerable pressure upon the provincial government for the opening up of new lands to provide for immigration and for the surplus native population. An important feature of the Act of 1913 was the provision for a classification of soils, with the object of directing settlement to lands really suitable for farming purposes. This wise provision is now being carried out, and the result will no doubt be to reduce to a minimum settlement upon the non-agricultural lands. The evil effects of such settlement may be seen in every province of Canada, and are due to the previous absence of a definite policy for the directing of settlement to lands really fit for that purpose.

The province of New Brunswick has undertaken to avoid the recurrence of such tragedies as were discovered by the Commission of Conservation to have been enacted in certain portions of the Trent watershed, Otario, where settlers were allowed to locate on poor, sandy soils, then chiefly valuable for their timber. With the removal of the timber and the exodus of the lumbering industry these settlers have been left stranded, with no opportunity to make a comfortable living, and faced with the necessity of constantly lowering their standards.

The work of land classification in New Brunswick is being carried on in connection with the timber estimate and mapping of Crown lands. The country is covered systematically and examinations of the soil are made at regular intervals. Beyond doubt the result will me the opening up of new lands for settlement and the establishment of new communities under conditions which will ensure comfort and a reasonable standard of living. This, in turn, will mean a permanent increase in the population of the province, by providing for the native surplus as well as for immigrants.

The Commission of Conservation has co-operated with the provincial government in laying the foundation for the land classification work, through the detail of several experts who have just returned from an extended trip to the several localities in which the field parties are now operating.—C. L.

AFTER-HARVEST CULTIVATION

The following extracts are from the report on Illustration Farms given at the annual meeting of the Conservation Commission in January, 1916:

Five of the farmers chosen to conduct illustration work had been practicing after-harvest cultivation previous to the visits of the commission's instructor. Since his visits twenty of the farmers have adopted this practice. Eighteen state that it has helped to keep down weeds, and that it has increased their yields and the profits from their farms.

George R. Barrie (Galt, Ont.): "Our experience with after-harvest cultivation has proven to us that it helps greatly in keeping down weeds and the land is in a better condition to withstand the drought the next year."

W. T. Hands (Perth, Ont.): "Excepting clover seed production and seeding, this is, in my opinion, the most important illustration. We find it pays from every standpoint, and as proof that this part of the work has been noticed, many of the farmers in this district are demonstrating its value for themselves, and the acreage increases yearly. Three years ago this was not done."

Thos. Hall (Brooklin, Ont.): "If one wants good crops he has to gang plow and cultivate after the harvest."

Thomas McDowell (Shawville, P. Q.): "After-harvest cultivation was not practiced in this community until three years ago, and now many farmers are doing quite a lot of it, and find it very profitable, for it usually insures a good catch of grass and clover, leaving the land quite porous and fertile."

Albert Schurman (Central Bedeque, P. E. I.): "I notice many of my neighbors are taking up this practice."—F. C. N.

Good fall pasturage is an important consideration on every farm where live stock is kept. Too little attention is given to provide it.

PRUNING AND GENERAL CARE OF ORCHARD TREES

When you are quite sure your land is in proper shape to receive your trees, and you are ready to set them out, trim out with a good sharp knife and clean cuts all broken and bruised roots. Some trim all roots back to five or six inches of the main stem, especially with pears; but unless the stem is very small I prefer to shorten the roots only as much as is necessary to remove injured and extremely long ones. Place the roots in as natural a position as possible, and fill in about them carefully with fine dirt well firmed down. Fill up the hole, and see that the tree is set good and solid; should be set two or four inches deeper than when it was in the nursery. Dwarf pears, which are budded on quince roots, may be set so that the union will come two or three inches below the surface, to prevent the tree from blowing over as it grows larger. Do not set deeper, or the pear stem may send out roots and in time get ahead of the quince root, resulting in a tree which is not a dwarf. A heap of dirt may be placed about the swelling where the union is made if the union comes above ground, and a few surface rootlets from the pear may serve as anchors; but the better way is to set a bit deeper, as just explained.

After the trees are set the tops may be trimmed according to the type of tree desired when it is mature. For Maine the open-topped, rather low-headed style is best. Most trees are two years old as they come from the nursery and have received some training there. Start the head, or first, branch about three feet or less from the ground. Three branches are considered by many to be an ideal number for apples. They should be disposed at different heights along the body of the tree, about three or six inches apart, and distributed as evenly as possible around the body as a central axis. These three branches should not be more than 12 or 10 inches in length. At the close of the first season's growth each of these branches should be treated as a separate tree, and if possible three subdivisions of these should be retained to supply wood for the next year's needs. These three branches should be cut back to about the same length as the first original three branches with which the tree started. This method should be followed each succeeding year. By using good judgment a symmetrical development will result. If you desire to modify the growth of a tree, remember to cut to an outside or an inside bud as you desire a spreading or an upright character. You should know whether the individual variety is normally of an upright or of a spreading nature, and vary your method of pruning to conform to your ideals.

It is important that you get a picture in mind of the mature tree as you desire it to look, and then by all means stick to it when training your young tree.

What has been written is especially for the apple, but applies in general to the pear. In forming the head of a pear, more branches may be left, however, and it may be started even lower. A well-grown pear tree may have as many branches as four or five, depending upon the condition of the roots. If roots have been badly bruised or broken so they must be severely shortened, then the branches left on the stem must be shortened and lessened in proportion. As soon as the tree is in bearing there will be less need of trimming or pruning. Dwarf pears are usually trained to the pyramid form, and must be handled differ-

Nearly Lost Little Girl from

DYSENTERY

She Was Cured By Using

DR. FOWLER'S

Extract of Wild Strawberry.

Dysentery manifests itself with varying degrees of intensity, but in well marked cases the attack is commonly preceded by loss of appetite, and some amount of diarrhoea, which gradually increases in severity, and is accompanied with griping pains in the abdomen. The discharges from the bowels succeed each other with great frequency, and the matter passed from the bowels, which at first resemble those of ordinary diarrhoea, soon change their character becoming scanty, mucous or slimy, and subsequently mixed with, or consisting wholly of, blood.

Never neglect what at first appears to be a slight attack of diarrhoea or dysentery may set in. Cure the first symptoms by the use of Dr. Fowler's Extract of Wild Strawberry.

Mrs. John Peterson, Radville, Sask., writes: "I cannot speak too highly for Dr. Fowler's Extract of Wild Strawberry. I nearly lost my little girl, aged three years. I took her to the doctor, and he told me her temperature was 104, and forbid me taking her out to our home, six miles from town, but I was forced to go on account of leaving my small baby home. We managed to get her home, but the fever did not go any lower, and we thought we would lose her sure, as she was so bad with dysentery she even passed blood. A neighbor came in and brought Dr. Fowler's Extract of Wild Strawberry, and told me to give her a few doses. This we did, and the next day she took a change for the better, but it was quite a time before she was on her feet again. I do believe if it had not been for 'Dr. Fowler's,' my little one would have died."

The genuine "Dr. Fowler's" is manufactured only by the T. Milburn Co., Limited, Toronto, Ont. Price, 35 cents.

SUMMER SHOES FOR MEN WHO WORK

Here is something new in footwear specially suitable for farmers, woodsmen, millmen, trackmen, laborers—all those needing strong yet light, cool, easy shoes. These are made on good-fitting right and left lasts from our famous oil-tanned Skowhegan waterproof leather with waterproofed sole leather outsoles and solid insoles.

Palmer's "Moose Head Brand"
"SUMMER PACKS" and "HARVEST SHOES"

are light weight, comfortable, durable working shoes for spring, summer and fall wear. Sold by leading dealers everywhere. If your merchant does not carry them write us, giving his name and address, and we will see that they are placed within your reach. Made 4, 6 and 9 inches high. 19

HANTSPORT, N S.

ently from the standard or larger trees. The one-year-old nursery tree may be cut back to 12 or 15 inches and branches allowed to grow from near the ground to the top. Shorten most of the branches nearest the top, graduating them so that the bottom ones are longest. The symmetrical development of the dwarf pear when grown in this form depends altogether upon the annual pruning of the lateral branches It is usually best to cut back to an inside bud each year, as this tends to an upright, compact growth.

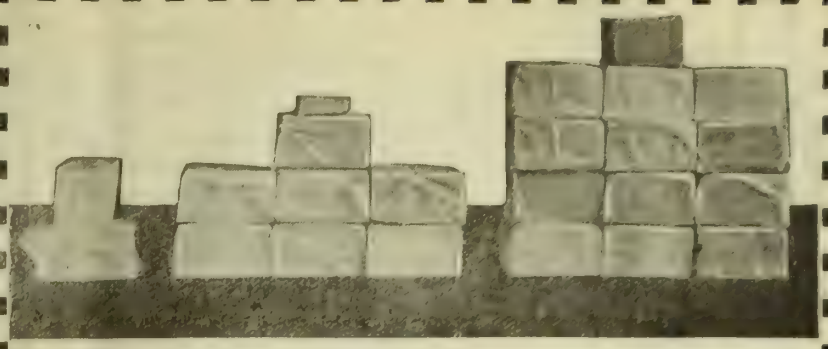
The plum usually bears early and abundantly, and so does not need so much attention once it has reached bearing age. Shorten back the branches to two or three good buds, and cut out the central leader when planting. Remove all but four or five of the branches after the first season's growth, but these need not be shortened. In succeeding years cut out any dead or interfering branches, and trim what is necessary to keep the tree in shape. Except the fast-growing, sprawling kinds, like the Burbank, the plum requires much less pruning than the apple.

Sweet cherries may be handled like the plum. Do what shaping you desire during the first three or four years, as the less trimming after that the better. Sour cherries require very little pruning, except to remove dead branches. as must be done for all trees. As it naturally forms a round, open head, the central leader may remain. If a branch must be trimmed, cut it out entirely, as you should all those that cross or interfere in the development of the tree.

The advantages of cultivation are so many, and ought to be so well understood, as not to need much attention in this article. With young trees just starting it is essential not only to give them the right soil, location, and a properly prepared place to live, but to so keep down the weeds and stir the soil as to keep them growing steadily. For a few years small crops like beans, potatoes, or small fruits may be planted between the trees and rows, thus your cultivation will do for both trees and "fillers." Grass and grain ought not to be allowed in the young orchard. Sometimes too much cultivation very late in the season will cause the young growth to be injured by severe winter freezes. This is not usual, as the average person will cultivate too little as a rule. However, the remedy is to cease stirring the soil early enough to allow the present season's growth to harden before freezing weather.

Blackberries and raspberries should be cut back to four or five inches at time of planting. Let them grow in the form of a hedge row, and keep of the E 8cmfwypshrdlubgkqjvbvb weeds out of the row by constant horse cultivation. At the end of the fruiting season cut out all the canes that have just fruited. With all tall growing sorts we like to pinch off the tops of canes when three feet tall, thus causing them to become bushy and prevent their bending over and snarling up. It is entirely possible to select varieties that are perfectly hardy and will not need winter protection.

Gooseberries and currants are similar in needs. Plant them early, and give thorough, shallow cultivation. Cut the gooseberry back one-half at planting time, and see that the soil is well firmed about the roots. The best fruit is borne on canes two or three years old. Prune to encourage new growth, and keep all old wood over five years cut out. Prune the currant the same as the gooseberry, but leave no wood older than three years. Unlike the gooseberry, the currant sprouts freely, so some of the young shoots will need to be removed each year. Four to eight stems are enough, and these should not be allowed to grow taller than two or three feet.—D. M. Grover, in Maine Farmer.



Separator running at full speed. Loss of butter 1.75 pounds

Speed reduced 10 revolutions. Loss of butter 7.28 pounds

Speed reduced 20 revolutions. Loss of butter 12.74 pounds

Which pile did *you* lose?

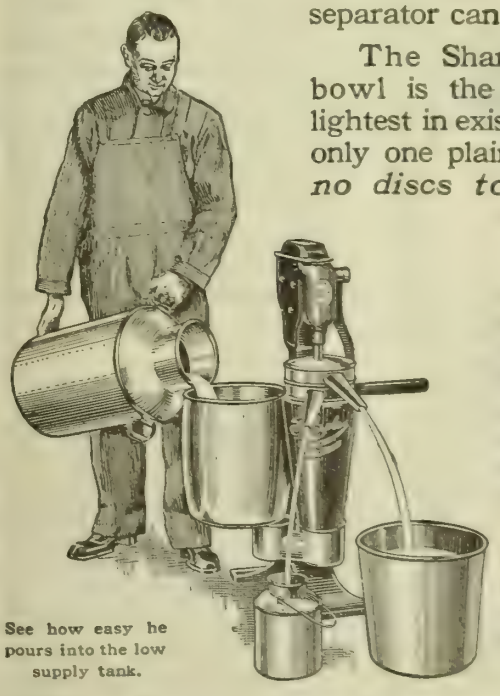
These figures from the Purdue Experiment Station Bulletin No. 116, show the loss in butter resulting from not turning a fixed-feed separator at exactly the speed stamped on the crank.

And investigations showed that 19 out of every 20 separator operators thruout the country turned their machines too slow much of the time.

THE NEW SHARPLES SUCTION-FEED

is the *only* separator made which *will not lose cream at varying speeds.* The wonderful "Suction-feed" always feeds the milk to the bowl in exact proportion to the separating force being generated. At 45 revolutions it *skims clean;* at 55 it *skims clean* and at 35 revolutions it *skims equally clean.* No other separator can do it.

No matter how you turn the New Sharples you always get *even thickness* cream. Just set the cream screw at the desired thickness and it will come out *velvety* and *even*—no matter how you vary the speed. No other separator can do it.



See how easy he pours into the low supply tank.

The Sharples Tubular bowl is the simplest and lightest in existence. It has only one plain part in it—*no discs to wash* and bother with.

All these and many other features explain why the New Sharples is the profitable separator for *you* to use. It is described in detail in catalog *"Velvet" for Dairymen.* Send for your copy today. Write Dept. 79.

DAIRYING.

CALCULATING WHAT COWS ARE DOING

In virtually any dairy district, probably among the herds supplying one factory, it is possible to find contrasts running something like this: One herd of 14 cows gives on the average 7,732 lbs. milk and 248 lbs, fat; while a neighbor's herd of 14 cows averages only 4,037 lbs. milk and 155 lbs. fat. Indeed, in looking over the records in eleven district the average DIFFERENCE between the high-bred averages and the low ones amounted to 4,639 lbs. milk and 140 lbs. fat per cow. This is certainly an extraordinary difference, and indicates that it will pay to calculate what cows can do.

Take it another way: In 1914 sixty patrons of two creameries began this cow calculation, cow testing. It was found in 1915 that their herds had made a gain over their 1913 record of 71 pounds of fat per cow, a gain of 8 per cent. But, on the other hand, the 1913 patrons of the same two creameries who did not go in for cold calculation fell off 87 pounds of fat per cow, seventeen per cent.

If the men now cow testing had made gains with their cows in the two years as those made who were testing, it would have meant an increase in the output of 85,362 pounds of butter.

High in Quality
Low in Price

YOUR roofing troubles will end when you invest in Everlastic Roofing. There is no better roofing value on the market, and no better made rubber roofing for any thing like this price. It defies wind and weather and insures dry buildings.

EVERLASTIC ROOFING

Everlastic Roofing is made with all the care and skill that have made our other products famous. On any steep roof it will wear like iron. Doesn't run in summer heat or dry out in the cold.

We can fill your orders for Everlastic Roofing promptly. Don't wait till your roof is all gone. Everlastic will save you money.

FEEDING FAT INTO MILK

According to all experimental work that has been done, fat cannot be fed into milk. This accords with the experience of observing and careful dairymen. It is, of course, possible to increase or decrease the fat per cent of the milk for a short time by creating some disturbance in the animal's digestion by improper feeding, or by some other method, either intentional or otherwise. However, this change in fat per cent will continue for a short time only, and the cow will later return to normal. It is also possible to bring cows up to freshening time in a somewhat fat condition, and they will for a time maintain a high fat percentage in their milk. As in the previous case, this fat percentage will not be maintained, and the cow will drop back to what is her normal percentage of fat.

The milk of each individual cow seems to possess a fixed composition that is natural to her. and under normal conditions the richness of the milk is in no way dependent upon the care or amount of feed fed, except that cows that are starved or greatly underfed may produce milk somewhat lower in fat percentage than normal. One is quite safe in saying that the kind of feed fed will not either raise or lower the average fat per cent of a cow; neither will it bring, in and of itself, temporary fluctuation in the fat per cent.—H. D.

KEEPING BUTTER

Butter is stored by the large commission men for periods of a year without serious deterioration in quality. This is done by having the tubs paraffined to prevent the escape of moisture and the entrance of molds, and by having the temperature very low and constant.

Butter to be kept for some time should be put up in large tubs rather than in small packages, as loss will be less, and the amount of butter which may be off flavor due to being on the outside of the package will be correspondingly less. When you wish to take one of the tubs out of storage, remove the butter from the tub and immerse it in weak brine. In this condition it will keep uptil used.—G. F. S.

Recent tests showed that virulent tubercle bacilli in matter taken from a tuberculous cow, spread thinly upon glass, wood, and muslin exposed to sunlight out of doors, were all dead after 30 minutes of such exposure; whereas bacilli from same source and prepared in exactly the same way, but placed in a dark room, were alive and virulent after 30 days had passed. As the tubercle bacilli are more resistant to the germicides than most other varieties of disease germs, it appears that sunshine may be made a valuable adjunct to the business of a breeder of live stock as elsewhere. The cheapest and most effective of disease destroyers and health preservers, it should be admitted freely to barns, stables, and yards, as well as to our homes.

REMEDY FOR CLOVER BLOAT

Whenever cattle are turned into clover or alfalfa pasture there is some danger of bloating or tympany. This is especially true if the pasture is heavy and the cattle are hungry and unaccustomed to this kind of pasture.

During the spring of 1913 an unusual growth of white clover in the pastures of Central Kentucky caused the occurrence of several severe cases of bloat. This was brought to the attention of the state experiment station, and a study was made of the subject to see if some remedy could be found.

It is well known that bloat is nothing more than an accumulation of gas in the rumen or paunch of the animal, and the first problem was to find the

Wilkinson Plows

THE oldest line of steel beam plows in the Dominion, made in the old Wilkinson Plow Co's factory, by old Wilkinson Plow Co. experts—every one of them men who know their business. It is **the standard line of plows** and includes 25 or more styles to choose from. U. S. S. Soft Center Steel Moldboards, highly tempered and **guaranteed** to clean in any soil. Steel beams, steel landsides and high carbon steel coulter. Clevises can be used either stiff or swing. Each plow is fitted especially with its own pair of handles—rock elm, long and heavy and thoroughly braced. The long body makes it a very steady running plow. Shares of all widths — specials for stony or clay land.

General purpose, light, medium, and heavy, side hill, sod, drill or one horse plows

The plow shown turns a beautiful furrow, with minimum draft and narrow furrow at finish. *Ask for new booklet.*

source of the gas. The two investigators, Healy and Nutter, found that the blossoms of clover and alfalfa contain considerable sugar, there being about 3.6 per cent by weight in red clover blossoms, 2.8 per cent in alfalfa blossoms, and 2.4 per cent in white clover blossoms, whereas in the blossoms of blue grass and in the leaves of clover and alfalfa there was less than 1 per cent.

By experiments they found that when clover and alfalfa blossoms were ground, mixed with water, and allowed to stand at about 102 degrees F., quite a considerable quantity of carbon dioxide gas was formed by the fermentation of the sugar. This is doubtless what takes place in the stomach of the animal.

As a remedy for bloat, the experimenters tried a drench of formalin with several cases, and found that it not only relieved the trouble but also caused no bad after effects. In view of these results the Kentucky Station recommends the following treatment for acute bloating: Drench with one quart of 1½ per cent solution of formalin, and place a wooden block in the animals mouth; if possible, exercise lightly. One-half ounce of commercial 40 per cent formalin in one quart of water makes the proper solution for the drench.

AYRSHIRE RECORDS

In the report of 25 Ayrshire cows and heifers that qualified in the Canadian Record of Performance from May 15th to June 30th 1916, it has again been demonstrated that Ayrshire cows are not only BIG producers but HIGH testers. All but one have a yearly test of over 3.50 per cent fat, the majority varying between 3.80 and 4 per cent. Nine cows tested over 4.15 and two tested over 4.50 per cent cat. There is a noticeable increase in the average production in butter fat among Ayrshires since the commencement of the R. O. P. test, as the following summary will show:

Altogether to May 1st, 1916:

224 mature cows gave a yearly average of 10,254 lbs. milk, 413.90 lbs. butter fat.

74 four-year-olds gave 9,358 lbs. milk 380.77 lbs. fat.

154 three-year-olds gave 8,447 lbs. milk, 346.71 lbs. fat.

318 two-year-olds gave 7,532 lbs. milk, 311.19 lbs. fat.

Average for the 770 cows and heifers, 8,682 lbs. milk and 354.80 lbs. fat. Average per cent of fat, 4.08 per cent. —W. F. Stephen, Secretary of the Canadian Ayrshire Breeders' Association, Huntingdon, Que.

NEVER TRUST THE BULL

News reports the past week record that three farmers were gored to death by bulls. In no instance was it related that the bull was ugly. It usually is the good bull that kills, the kind stallion that maims, and the trusted horse that runs away. In other words, a reputation for a kindly disposition lulls the farmer into a sense of security for which he sometimes pays with his life. The ugly bull is not turned to pasture; the "man-eating" stallion is carefully handled; and the skittish horse is driven with a control bit and is carefully tied when a stop is made. Extra-hazardous indeed is the risk of the farmer who deals with stock. He is safe enough with chickens and ducks, but infuriated turkey gobblers even have killed children.

Almost every other animal will bear watching—constant, close watching. Especially is this true of the males of the species, notwithstanding Kipling's estimate of the deadly qualities of "the female of the species."

The man who goes to sleep on a job, whether on the congested streets of the modern city, on the country road with its burden of speeding motor cars, or in the barn or pasture around the stock, is bidding for the services of the undertaker. It is not wise to boast that the prize winning bull, tended with infinite care by the herdsman, has "never done a mean thing." It is foolish to allow affection for a stallion to close "the weather eye" when working with him. The instinct primeval breaks out ever and again in civilized man, when he runs amuck and murders, and why should we imagine that it is more nearly subjugated in animals through years of domesticity? Eternal vigilance is the price of safety on the farm.

CARE OF CREAM CANS

A collection of dirty, dinged cream cans is an unsightly thing whether at the creamery, in course of shipment, or on the farm. It is the custom for creamery operators to wash cans and thoroughly scald them before they are sent back to the patrons, so that the only responsibility which rests upon the shipper is to see that the cans are kept in a sanitary plcae on the farm. In many cases very little attention is paid to the care of the cans when not in use. Too often they are allowed to lie around the stable, where the hens and other stock have access to them. To prevent dust getting into the cans the lids are frequently left on, resulting in a musty, close smell which is decidedly detrimental to the quality of the milk or cream to be shipped. To avoid this the lids should be taken off the cans as soon as they reach the farm and the cans turned bottom end up to insure the drainage of any water and also admit fresh air. The best plan is to keep the cans on the south side of the dairy on a shelf built for the purpose, where cans will receive the direct rays of the sun. Direct light of this kind is very important and a complete germicide. It dissipates any musty smell and leaves the cans sweet smelling and clean. To protect the cans from the rain it is advisable to build a roof over the shelf at sufficient height so that two tiers of cans may be put under it.

REGULATING CREAM BUYING STATIONS

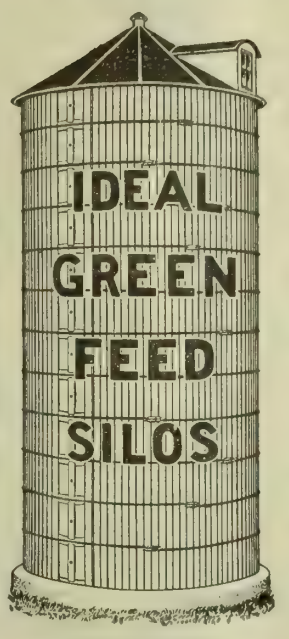
Dairy authorities in Manitoba and Saskatchewan have rightly concluded that the average cream gathering station, without proper supervision, is a detriment to the dairy industry. Legislation has been drafted to regulate these institutions in both provinces. The practice of assembling cream and milk in the general country store, hardware store, or butcher shop cannot be considered as providing conditions which are conduce to keeping it clean and sweet. The natural result is that it reaches market in poor condition and a reduction in price to the consumer must follow.

This progressive step toward the improvement of dairy products is to be highly commended. These gathering stations have long been recognized as a menace to the dairy industry. They must be strictly improved under most careful supervision.

Order Your Silo Now and Get Extra Profit at Every Milking

Don't try to go through another winter without silage. You cannot afford to. Feed is too high priced, and dairy products are too valuable. Order your Ideal Green Feed Silo now, and be prepared to get 25 per cent more milk from your cows and at the same time reduce your feed costs 15 to 20 per cent. There is no time to waste now. Get your order in at once, so that you will have plenty of time to erect your silo without rush or extra expense.

The Ideal Green Feed Silo Insures Good Silage



MADE IN CANADA

You cannot expect good silage from a makeshift silo. You cannot make or save money by buying such a silo, no matter how low its cost. Low price is not what makes a silo a good investment. It is the quality of the silage you get out of a silo, and the number of years of service it will give, that determine its value.

Every feature of the Ideal is the result of long experience in silo manufacturing. Every detail in the selecting of the material and the manufacturing and fitting of the parts, is clearly explained and illustrated in our large silo catalogue. There is nothing obscure or indefinite about the extra value you get in an Ideal.

Ask for copy of this catalogue, and read it. You will then see how carefully the material is selected, the staves milled, splined and fitted together, and secured against the tremendous pressure of the silage; and how the staves are treated with a preservative that protects them most effectually against the acid in the silage.

The man who buys a cheap silo in the hope of saving a little money on the first cost is very likely to lose a great deal more than he hopes to save. It would be foolish to put $160 worth of silage into a $175 silo, and lose $75 worth of silage simply for the sake of saving a little on the first cost, when, by paying $25 more and getting a good silo, he can prevent the loss of $75 not only once, but every year he uses the silo.

SOME COMMENTS ON THE HEAD OF THE PIG

Through various processes of breeding, man has wrought a remarkable change in the conformation of the pig. Perhaps in no one respect is this more notable than in the head. The wild pig, from which the domesticated one is descended, has a comparatively long and narrow head. The common wild pig, which is found in considerable numbers today in some of the more isolated parts of Europe, the native Guinea pig, the Babirussa of the Indian Archipelago, and the wart hog of South Africa, all have long, tapering snouts.

Darwin regarded the domesticated pig as derived from two sources—the common wild pig of Europe (Sus scrofa) and the aboriginal pig of India (Sus indicus), the parent form of which is unknown. This Indian pig, it has been assumed, had a short skull, and the Chinese type brought to England and America a century or more ago is believed to have descended from this species. The crossing of the Chinese breeds on the common European type shortened the head and changed its character in a remarkable degree.

Commenting on the change of skull, Darwin states that the modification in the most highly cultivated races is wonderful. He says: "The whole of the exterior in all its parts has been altered; the hinder surface, instead of sloping backward, is directed forward, entailing many changes in other parts; the front of the head is deeply concave; the orbits have a different shape; the auditory meatus (external ear) has a different direction and shape; the incisors of the upper and lower jaws do not touch each other, and they stand in both jaws beyond the plane of the molars; the canines of the upper jaw stand in front of those of the lower jaw, and this is a remarkable anomaly . . . The whole head is much shortened; thus while in common breeds its length to that of the body is as 1 to 6, in the 'culturracen' (quoting Nathusius) the proportion is as 1 to 9, and even recently as 1 to 11."

The earliest illustrated English writings on the pig show both long and short heads. In fact, 50 years ago the short head was much more popular in England than at the present day. I have in my possession a collection of engravings of prize English pigs, shown at Smithfield and elsewhere, as far back as 1867, and these in most cases show heads of extremely short form. A reaction has taken place, however, and the visitor to the British shows will not be impressed with the prevalence of abnormally short heads. The Tamworth has been brought down to date with a head of considerable length. The Berkshire has passed through various interesting phases of head development, exceeding any other common breed in the shortening process. The Large Yorkshire 15 years ago was bred in England to have a more or less upturned snout, though in no extreme sense. Today this type of head is not in favor, and the judges prefer the longer, plainer sort. The Berkshire in Great Britain as a rule has a head with a slight upward curve of snout and fair length. In America many of our breeders have sought to produce the short, dished face, or pug face, as it is sometimes termed. Each of the best-known American breeds is looked upon with most favor by the judges when the head is short and broad. As to whether the skull shall show a dished turn or not will depend upon the breed.

The head of the pig in itself is of secondary value when it reaches the butcher. Therefore, the greater the proportion of skull to body the smaller the percentage of high-class cuts to be secured from the carcass. I have seen Tamworths on the show circuit in the last few years that possessed a maximum length and weight of head, so that it seemed to me they carried a most undesirable percentage of head to body, resulting in unnecessary waste.

It as long been recognized that the various parts of the body have a distinct relationship to functional purposes. The head of the pig is especially adapted to rooting in the ground and there seeking for food. Sidney states that "the wild hog buries his snout deep, rooting the earth up in a straight line before him; the tame hog turns it up right and left, here and there." Nathusius, the great German authority, claims that rich and abundant food given during youth tends by some direct action to make the head broader and shorter, and that poor food works a contrary result. "He lays stress," writes Darwin, "on the fact that all wild and semi-domesticated pigs, in plowing up the ground with their muzzles, have while young to exert the powerful muscles fixed to the hinder part of the head. In highly cultivated races this habit is no longer followed and consequently the back of the skull becomes modified in shape, entailing other changes in other parts."

The length and character of the head, to a certain extent, seem to have a most important relationship to the size and reproductive capacity of the breed. This fact appears more or less apparent and is conceded by many breeders of experience. When the tendency has been to breed short, dished faces these have been associated with reduced size and breeding capacity. The Small Yorkshire breed, now about defunct as such, was a monstrosity in head development, and it was also the smallest, chunkiest, and most useless of our breeds. The Berkshire, one of the great breeds from more than one point of view, has in recent years been going through a head evolution that puts such a premium on the abbreviated front as materially to injure the value of the breed. The question may be asked in all candor: Is not the breeding of the short heads on the Berkshire associated with distinct deterioration of valued characteristics of this breed, notably size and fecundity?

The present-day demand for pigs of any breed calls for size and quality. It is to be noted, first, that females of the large breeds that produce good-sized litters are plain headed; and, second, that among the medium-sized breeds the large individuals, the brood sows of which farrow the largest litters, are the ones with the plainer types of head This being so, then it may be assumed that many of our breeders have gone too far in their attempts to produce short, fancy heads. To the contrary, the breed would fare

MORE CREAM THAN YOU EVER GOT BEFORE

The Magnet Will Give You This Service for 50 Years

A Clean Skimmer

The Magnet today is the closest skimming separator on the market. More than that. Twenty, thirty, even fifty years from now it will skim milk, hot or cold, of any degree of butter-fat just as cleanly and perfectly as it does today. The skimmer and bowl of the Magnet are different in design, better for skimming and easier to clean than any other design ever used.

Really Lasting Construction 50 Years Service

Cheap machines are made of cheap materials to sell at a low price. The Magnet is built of tested materials to give service for a lifetime. Best of castings, sound steel parts and bronze gearings make the Magnet the sturdiest and strongest separator ever built. Just ordinary handling (not special handling) will keep the machine operating right through your lifetime and into the next generation.

Great Exclusive Features

Look at the many features which are found only in the Magnet. Solid square gears, perfectly balanced, which run true without oiling, without effort and never wear away like cheap worm gears. They have the heft to carry the weight of milk so that there is no check-up in speed when the tank is filled. Skimmer is one piece and open—it can't clog with dirt while separating and is easily cleaned by hand and a cloth. Double support to the bowl which spins on bronze cushion bearings at top and bottom. No wobbling, so skims clean even when on rough ground. Weight of machine is low down. No need to screw down to levelled up floor.

Enthusiastic Owners

Each week we receive letters from farmers in every province of Canada telling us of the great satisfaction their "Magnets" are giving. George Telfer of Paris, Ont. has run his Magnet twice a day for seventeen years paying only a few cents for repairs Every owner is proud and enthusiastic because the Magnet never gives the least bit of trouble. They like the easy running and appreciate the perfect skimming of this honestly built separator. They're glad of the time it saves, because it's so convenient for cleaning. And they know it's a lifetime investment that's paying returns now and will pay them years from now.

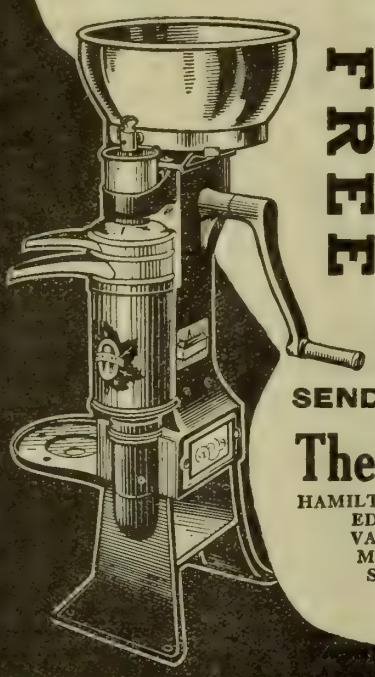
MAGNET CREAM SEPARATORS

Lowest Repair Cost of Any Machine

Farmers who own a Magnet are insured against repair costs. The square gears never run down. The spindle runs freely on ball bearings without pressure and so cannot snap like spindles do in cheap worm-geared machines. No wobbling, no oiling, no complex parts. One tool—the Magnet wrench—is all you need for adjustment.

Will Cut Your Dairying Costs — and Save You Trouble and Labor.

The more you use the Magnet the easier it is to run. It will save dollars of your dairying expense. The Magnet is soundly built and very seldom needs repairs. Every ounce of butter-fat in the milk will be delivered by the perfect-skimming Magnet. No giving valuable cream to the pigs with a Magnet in your dairy. And it will pay for itself in the time and labor it saves you. Five minutes—no more—is all you need to spend in cleaning the Magnet. None of those awkward discs in the Magnet skimmer. It's one piece and open so even a child can skim it.



FREE

Big Dairying Books and Demonstration

You'll be interested in our books on dairying and in the catalog which gives you photographs of every part of the Magnet. Hundreds of farmers will tell you in our catalog what the Magnet has done for them. Maybe, too, you would like to see a Magnet at work. Write now and tell us so, and we will bring a Magnet to your own dairy. We will operate it for you on your own farm, free from any cost or obligation whatsoever to you. Write now while it is in your mind.

better if heads of medium length were produced, combined with quality, refinement, and smoothness enough to bear evidence that the other parts of the body were in keeping with superior production of flesh and progeny.

It is interesting to note that the Poland-China of other days was large and somewhat plain of head. In this day of controversy regarding this breed the big type breeders show a class of stock comparatively free from short, wide heads and prematurely ripened bodies. The Spotted Poland-China now being so aggressively pushed, is meeting with favor because it furnishes scale and fecundity, so often lacking in the more highly bred, short-headed Poland-China. The Duroc-Jersey has met with remarkable popularity in the middle west, largely on account of its size and fecundity. Individuals of this breed naturally have a straight, strong, plain head, and it is to be noted that in cases where a short, slightly dished, refined hea doccurs as a rule the pig is of smaller and more refined character. Duroc-Jersey breeders must have a care or they will bring this breed to the point of self-defence that has occurred among the Poland-China men. —C. S. Plumb, Ohio State University, in Breeders' Gazette.

ASCERTAINING WEIGHT OF CATTLE BY MEASUREMENT

One of our subscribers has asked for a table or rule whereby the weight of live cattble may be ascertained by measurement. The following, reprinted from "Beef Raising in Canada," will doubtless prove of value to many of our readers:

Long experience in the cattle trade may enable a feeder or dealer to estimate an animal's weight fairly closely. At times, however, even the experienced are out when the scale is applied. The beginner, when the scales are not at hand, usually guesses either too high or too low. We have seen a 1,100 pound animal's weight variously estimated at from 850 to 1,250 pounds —a wide difference of 400 pounds, and that among farmers who had been raising cattle but usually selling per head in place of per hundredweight. This is but one instance of hundreds similar that have come under our notice in recent years.

Where the stockman does not have a scale the foregoing table of weights based upon heart girth measurements will be found to give an approximately fair idea of the animal's weight. The girth should be taken just back of the shoulder and forelegs at the place where the body is shallowest. This place may be found by drawing the tape back and forth a few times before tightening to take the measurements.

THE HORSE

SLOPING SHOULDERS IN SADDLE HORSES

On perfectly smooth surfaces height of action is a waste of energy and the forward drive of the hind leg will accomplish less distance when the weight of the horse is raised too high into air. Runners or trotters of extreme speed are apt to have daisy-clipping habits. The harder the drive the longer the stride, because the body is driven farther in its trajectory before the feet again strike the earth. A horse will adapt its action so far as possible to the ground it has to cover, but if its conformation is such that it is naturally under-actioned and somewhat over-driven from behind it will be more difficult for the horse to adapt itself than when its action is shorter and more collected.

On the other hand, extravagant knee action is rough and wearing. Many a horse gets the prize for high action which is merely a chopper. A horse should have natural action adapted to the job which it is to do; otherwise the farm horse would be stubbing its toes and the saddle horse be unequal to traversing rough ground with safety.

With the saddler sloping shoulders are of first importance. A horse with an oblique shoulder always has a leg to spare and can recover after stepping on a rolling stone, or if the ground gives way beneath. No woman should ever be allowed to ride a bad-shouldered horse. Observation of straight-shouldered horses will at once reveal that their forelegs are so placed as to make recovery from a misstep extremely difficult, and the hind quarters cannot be brought up under them to aid recovery so effectively as can those of horses with sloping shoulders.

A horse with a sloping shoulder may have a daisy-clipping action, stub its toe, stumble often, and yet always recover. Such horses are aggravating to ride, but they may be quite safe. By rounding the toe of the front shoe to the natural wear of the hoof and bringing the hind quarter under with sufficient length of bearing on the hind shoe they often become perfect saddle horses on rough ground. A straight-shouldered horse has its forelegs too far under, and cannot throw support forward as quickly as needed; its effort after stumbling is quite different from that of the sloping-shouldered horse, which easily throws the succeeding leg forward so that it takes the place of the leg that failed. The straight-shouldered horse can only partially accomplish this; there is too much weight falling forward of the center of gravity of the foreleg, and if the horse recovers from the overbalance of weight it is by a succession of efforts, each one in itself difficult and incomplete.

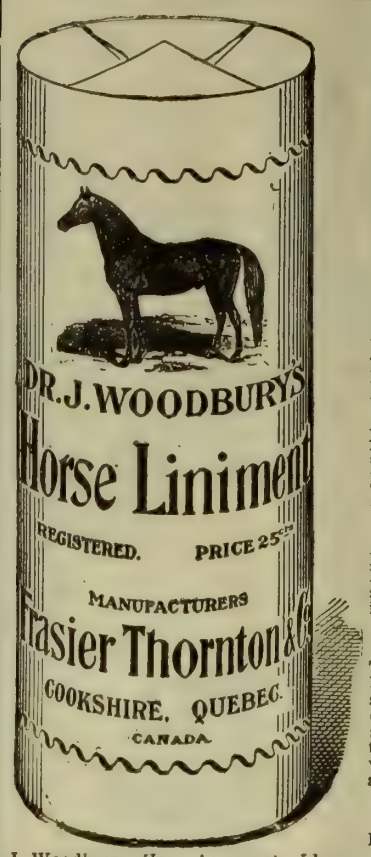
If the tasks imposed are hard enough, whether leaping, running stock, or excessive road work, a horse is bound to fall sometimes; but the moment between the mistake and the fall will give the rider a chance to get clear. It is much more easy for the rider to retain the center of gravity on an oblique-shouldered horse than on the other kind, which carries over so suddenly the plane on which the rider sits that there is a likelihood of falling immediately in front of the horse. This hardly ever happens with a sloping-shouldered horse, the rider going to one side or the other. One horse represents a straight fall, the other a roll down a slope. Unless very sluggish, horses do not like falling. The muscular, straight-shouldered horse does what it can to remedy the defects of its conformation, but the fact remains that when both horses are put to the extreme stress that threatens overthrow the sloping-shouldered horse can recover and the other can not.—L. Ogilvy.

HOT WEATHER RULES FOR THE HORSEMAN

1. Load lightly; drive slowly.
2. Stop in the shade if possible.
3. Water your horse as often as possible. So long as a horse is working, water in small quantities will not hurt him. But let him drink only a few swallows if he is going to stand still. Do not fail to water him at night after he has eaten his hay.
4. When he comes in after work, sponge off the harness marks and sweat, his eyes, his nose, and mouth, and the dock. Wash his feet, but not his legs.
5. If the thermometer is 75 degrees or higher, wipe him all over with a damp sponge. Use vinegar water if possible. Do not turn the hose on him.
6. Saturday night give a bran mash, lukewarm, and add a tablespoonful of saltpetre.
7. Do not use a horse hat unless it is a canopy-top hat. The ordinary bell-shaped hat does more harm than good.
8. A sponge on top of the head, or even a cloth, is good if kept wet. If dry, it is worse than nothing.
9. If the horse is overcome by heaat, get him into the shade, remove harness and bridle, wash out his mouth, sponge him all over, shower his legs, and give him two ounces of aromatic spirits of ammonia, or two ounces of sweet spirits of nitre, in a pint of water; or give him a pint of warm coffee. Cool his head at once, using cold water, or if necessary chopped ice wrapped in a cloth.
10. If the horse is off his feed, try him with two quarts of oats mixed with bran, and a little water; add a little salt or sugar. Or give him oatmeal gruel or barley water to drink.
11. Watch your horse. If he stops sweating suddenly, or if he breathes short and quick, or if his ears droop, or if he stands with his legs braced sideways, he is in danger of a heat or sunstroke and needs attention at once.
12. If it is so hot that the horse sweats in the stable at night, tie him outside with bedding under him. Unless he cools off during the night he cannot well stand the next day's heat.

Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.

Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

Comfort and Cure for Baby's Skin Troubles

Dr. Chase's Ointment Cured When Baby's Body Was Covered With Distressing Eczema.

If every mother could try Dr. Chase's Ointment for the chafing, skin irritation and resulting eczema which tortures so many babies, what a blessing it would be for the little ones.

This letter will give you an idea of what a wonderful work this Ointment is doing in the way of bringing comfort to children who are so unfortunate as to contract eczema. It is so easy for this trouble to develop from chafing or irritation caused by the clothing, and so difficult to get it cured, that Dr. Chase's Ointment is appreciated when once its healing qualities are known.

Mr. M. L. Duclos, Postmaster, Dugnayville, N. B., writes: "I believe it is my duty to recommend Dr. Chase's Ointment as a cure for eczema. My baby was seized with eczema and his face and arms were covered with this terrible disease. After trying all sorts of ointments the disease continued to spread until it covered the entire body. When the itching became bad he would scratch himself and was sometimes found in his cradle covered with blood. Hearing about Dr. Chase's Ointment I bought two boxes and before this was all used the child was cured. That was a year ago, and there has been no trace of eczema since. I recommended Dr. Chase's Ointment to all who suffer from eczema as being the best treatment in the world for itching skin diseases."

Dr. Chase's Ointment is for sale by all dealers at 60 cents a box. It is a good idea to keep it at hand along with the bath soap to be used for roughness of the skin, chafing or irritation. Prevention is so much better than cure. Powders clog the pores, but Dr. Chase's Ointment cleanses the pores and thereby keeps the skin soft and smooth. Sample box free if you mention this paper. Edmanson, Bates & Co., Limited, Toronto.

What Standardization Means to Motor Car Buyers

IT means VALUE. Just to the extent that a car is standardized does the buyer's dollar approach the maximum of purchasing power.

Standardization means definite, proved quality, known manufacturing costs and reduced selling costs.

Of the million autos that will be sold in 1916, 75% will be standardized cars selling for less than $1000.00 each. This remarkable American achievement is the direct result of standardization.

Finally the upholstery has been standardized by the almost universal adoption of

DU PONT FABRIKOID

REG U S PAT OFF

MOTOR QUALITY

40% of all 1915 cars sold were upholstered in this proved, guaranteed material and in 1916 the total will be at least 60%.

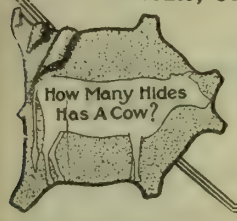
Fabrikoid is the only standardized automobile upholstery. It wears better than coated splits (commonly sold as "genuine leather") and has the artistic appearance and luxurious comfort of the best leather.

Rayntite Fabrikoid for tops, single or double texture, is guaranteed one year against leaking, but made to last the life of the car.

To get the most for your money, buy a standardized car

Du Pont Fabrikoid Co.

Toronto, Ontario.



Craftsman Fabrikoid, the artistic upholstery material for furniture and home decoration is sold by leading department stores.

POULTRY

COMMON DISEASES OF POULTRY AND TREATMENT ADVISED

A bulletin has just been compiled by the director of the Laboratory for Poultry Investigations and Pathology, Animal Industrial Division, North Carolina Experiment Station, West Raleigh, and is especially intended for practical poultry keepers. The treatments recommended are the result of the writer's experience.

Against poultry lice (Menopon biseriatum and M. Pallidum on chickens; Gonoides stylifer on turkeys; Lipeurus baculus on pigeons) a very effective insect powder is made by taking crude carbolic acid one pint, and gasoline three pints, mixing with sufficient plaster of paris to make a slightly moist mixture, then rubbing it through a sieve. Let it lie for about two hours, when the powder will be found to be dry. If not used at once it must be kept in a well closed can. A bird thoroughly dusted with this mixture need not be redusted for three months.

Against the large head louse (M. biseriatum) a good treatment is to grease the top of the head with plain vaseline or lard if the chicks are young, while older birds are best treated by either dipping in a good coal tar dip or by dusting with an insecticide.

Against mites, cleanliness, disinfection, and dusting with the insect powder mentioned above are recommended.

Against scaly legs first soak the scabs in warm water, then with a brush remove all scabs possible, after which scrape with a dull knife. When the legs are dry, saturate with gasoline. Repeat this treatment every five days. A hot solution of lime and sulphur dip has been used with excellent results.

Internal Parasites

The large round worm (Acaris inflexa) is present in over 25 per cent of the birds purchased on the market. As a preventive measure the yard and fowl house must be kept clean. As treatment the birds should be made to fast for 24 hours, then give each bird one teaspoonful of olive oil and one teaspoonsful of turpentine separately.

The tape worm is treated by fasting the birds 24 hours and then giving them a tablespoonful of turpentine and a tablespoonful of epsom salts dissolved in hot water. If it is desired to avoid medicating each bird separately, give three gains of powdered areca nut to each bird in a mash of wheat shorts.

The gape worm forms clusters in the trachea of many birds and it is treated by extirpating them by means of a doubled horse hair or by a feather dipped into turpentine.

Contagious Diseases.—Black head, or enterohepatitis, affects turkeys and more rarely chickens. For its treatment permanganate of patash may be used in the water. Sulphocarbolates of calcium, sodium and zinc in equal parts have given good results in doses of half a grain of the mixture three times a day for each bird.

Fowl Cholera.—Intestinal antiseptics are indicated. Permanganate of potash can be used as recommended under black head. Also the three sulphocarbolates are valuable, as well as a solution of one part of bichloride of mercury in ten thousand of water.

White diarrhoea caused by Bacterium Pullorum has been successfully controlled by the sulphocarbolates mentioned above.

Chickenpox or sore head may be treated by touching the sores with carbolic acid, or with iodine, or kerosene. Sick birds should also be given a tablespoonful of castor oil.

Roup or avian diphtheria is a highly contagious disease, and if the bird affected with it is not a valuable one it is better to destroy it. If it is desired to treat it, the nasal canal must first be syringed with a 20 per cent solution of bicarbonate of soda to dissolve the mucus; then with equal parts of peroxide of hydrogen and water so as to cleanse thoroughly the parts, after which the following mixture should be injected:

Oil of Thyme 30 minims, oil of eucalyptus 20 minims, menthol 10 grains, oil petrol 2 ounces. All these liquids should be warm. The ulcers in the mouth are to be touched with a stick of nitrate of silver.

The Bake-Day Smile!

Little Miss MAIDEN CANADA

Supreme Chocolate is a pure, unsweetened, cooking chocolate, easily melted and mixed, containing that rich chocolate flavour that can only be obtained from the finest cocoa beans. TAKING HENS THROUGH THE MOLT

The annual molt, which starts with the arrival of dog days, is a most critical time in the life of hens. Shedding old feathers and growing new ones comes when the vitality is at a low ebb. In a normal molt about four months are required for a complete change of plumage, the first feathers beginning to fall about July 1. At first the egg production does not materially decrease, but as the process advances the drain on the system increases until the production gradually diminishes toward September 1. Usually egg laying will not commence again until the new set of feathers is complete.

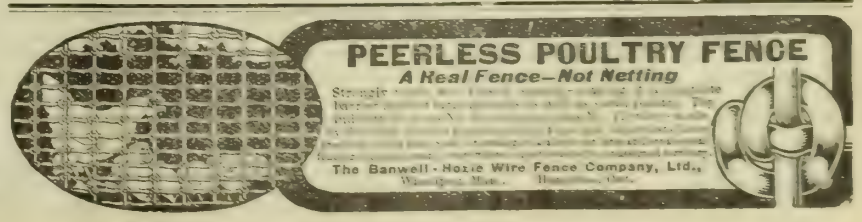
If, however, the poultryman is fortunate enough to bring his hens successfully through the molt and get them laying by mid-November, the fowls will probably continue to lay throughout the winter. Thus poultrymen wishing to produce winter eggs for market are very anxious to get their hens through the molt at an early date.

In order to accomplish this end some advocate forcing the molt. This may be done by practically starving the hens for a week or ten days and then putting them on a heavy ration of rich food. While this does cause a quick molt, experimental evidence does not show it promotive of good later egg production.

The feeding of molting hens should not differ greatly from that of laying hens. Both eggs and feathers are rich in nitrogen, so a food adaptable for eggs will also make feathers. However, the latter are richer in oil than eggs, and some food of oily nature should be added to the ration to supply this want. It has been conclusively proved that a liberal amount of sunflower, flaxseed or oil meal to the ration makes hens molt faster and leaves them in a stronger condition and with more vitality.

A spinster says an old bachelor is a man who has overlooked an opportunity to make some woman miserable for life.

The difference between a compliment and flattery depends on whether it is handed to you or some other person.



FOR HOME AND COUNTRY

This Department is devoted to the best interests of the Homes of the Maritime Provinces. Contributors to these columns are leaders in the "For Home and Country" movement. This Department is yours. Use it to the best advantage by sending us timely suggestions, short articles dealing with your experiences, and reports of your Institute meetings.

Leaving the Old Home

Hester and Jacob Cross had a letter from their only son, which caused them both a great deal of anxious thought. "You see, father," so ran a portion of the letter, "I can seldom leave my business to go out to see you, it is such a long, expensive journey, and I must think of saving the dollars and cents, now that I have a wife and child to provide for; so I agree with my wife that it would be a good idea for you and mother to come out here—just close up the old place and come out here and live with us for good. No use trying to sell anything, for no one would care to buy such a little tumble-down house; and, if I remember right, there isn't a piece of furniture in it which is worth above a dollar. Just pack your clothes and a few things you value most and come right along and live with us."

"Don't you think Henry speaks a little too slightingly of the old home, Hester?" asked Jacob of his wife. "It was good enough for me and my father before me, and he had a good, comfortable bringing up in it."

"I s'pose he's got so forehanded that he can live in a way that makes the old things seem dreadful old, and he can't help it, Jacob," replied Hester, ready now, as in the time of her son's boyhood, to make excuses for his shortcomings. Yet there were plainly written upon her face lines of pain caused by some of the words in her boy's letter, which not even the seemingly sincere and hearty invitation to come and live with them could smooth out.

Yet her heart swelled with pride at the thought of leaving the old home of comparative poverty for her son's home, filled, as she judged by his letters, with all the luxuries and comforts which money could buy; and she endeavored to bring her husband around to her own state of mind, which was becoming each moment more and more favorable toward the project of breaking up their housekeeping and going to Glenfield to live with their son.

So it came about that the time for their departure was near at hand, and they were making ready to go.

"Might as well take all the things down and pack them in boxes, so if we should ever happen to want any of them we can send for them and have no bother about anything."

Jacob raised his thoughtful eyes to his wife's flushed face in careful consideration.

"I wouldn't, Hetty; they'll keep better just where they are, I think. Whoever comes for them can pack them. You need your strength for the journey; let everything stay just as it is, I say."

So they merely closed the blinds, curtains, and doors, as if retiring for the night, or going out to call on a neighbor for an evening, and started with fluttering hearts upon their long overland journey to Glenfield.

All the way Hester Cross dreamed longingly of the meeting so soon to be. She had never seen the dear baby, nor, indeed, its mother, her son's wife; but her great heart was fully prepared to take them both in and enshrine them beside Jacob and Henry, and the nearer she drew to her journey's end the more eagerly she anticipated the pleasure of meeting them.

At length, dusty and travel-worn, Hester and Jacob Cross stood upon the steps of their son's rather pretentious house, waiting for admission.

By some unfortunate mistake or omission, no one had met them at the station, and they had found their way to their son's house as best they could.

And no one met them cordially at the hall door, as would have been the case in their ow home if any one they loved had come to visit them. Instead, a servant came at length, and, with eyebrows raised, superciliously showed them with a doubtful air into a richly furnished parlor.

It seemed a long time to their weary eagerness before their son's wife, a vision of beauty, smiling, and with condescending air, came to meet them. She tried to make them feel at ease and amply apologized for the oversight of failing to meet them at the station, but in spite of all her efforts something was lacking and the father and mother from the "little old tumble-down house" away back in the country hoped faintly that the meeting with Henry and the baby would be of a character to warm up their chilled spirits and drive out that spectre which already wore the garb and appearance of homesickness and persistently sat in their inmost souls.

Shown to their room, which was a model of comfort and convenience, they rested and refreshed themselves, and waited, as they had been requested, till summoned to dinner, where they met their son for the first time in ten years.

They had no real reason to complain of any lack of warmth in their son's greeting, and he was genuinely glad to see them. The mercury of their spirits ran rapidly up; but still they had not seen baby.

Grandma felt that she was being defrauded, and ventured to speak of the desire of her heart.

"Baby? Oh, yes! Nurse shall bring her down for half an hour after dinner," was the smiling reply; and down to zero again dropped the mercury of grandma's hope, and grandpa sympathized with her.

But, oh, when that half hour came! Frail, but fair and sweet as one of her day lilies at home, grandma thought, and her heart went out to the little girl with a longing love and care for it in the old time ways in which she had nurtured her baby, her only one, the father of this one, but as different to it as the ox-eye daisy to the forget-me-nots.

Hester Cross clung to the child with loving tenderness, loath, when the limit of time was reached, to give it to the nurse, who waited for her charge.

"We'll see," she said, when she and Jacob were alone again; "we'll see if I am not to have any comfort with Henry's baby. That nurse girl shall not have everything her own way, but there's one thing she may have, and that's a rest."

Jacob looked thoughtful and said little. He saw further into matters than his wife. She, without being conceited, had more confidence in her own ability to do things for others in her own way satisfactorily to them, as well as herself, and in this case, as one or twice before, he felt that she was going to be disappointed.

Before he had time to speak a word in reply a door opened and closed somewhere near, and they heard the soft, modulated tones of their daughter-in-law in conversation with her husband.

"They are dear old people," she said in reply to a question of Henry's, "but I am afraid a difficulty will arise in regard to Lelna. I cannot have nurse interfered with in the care of our child."

"Undoubtedly mother will find her greatest pleasure in devoting herself to the interests of baby. What is the objection, my dear?"

"Oh, Henry! In these days of enlightenment, I wonder you have not learned better than to ask such a question. Without being actually diseased, your mother is old and probably in a weak state of health. If we allowed her to nurse baby and caress her as she did today to any great extent, we would without doubt be subjecting our delicate baby to almost certain infection that would be seriously, perhaps fatally, injurious to her health. Don't you think so?"

"I am afraid, my dear, that this is one of the few subjects upon which we differ slightly. When babies and their grandmothers are separated from each other by the newfangled notions you are learning at your meetings and clubs, there is a line drawn beyond which my sympathy will not reach."

The door closed sharply, and they heard the step of their son pass out along the hall and down the stairs.

The old couple looked at each other and each read in the eyes of the other the same thought. It was left to Hester to give expression to it, however.

"Jacob, our luggage is still at the depot; it shall never be brought into this house by my consent. I want to go home."

His lip quivered, but he smiled acquiescence, and hastened out to intercept his son, who might be going to attend to the matter of having their boxes brought to the house.

To say that Henry Cross was astonished and hurt does not express his state of mind when his father had caught his arm as he was turning a corner and hurriedly informed him of his mother's decision. Hurriedly, because if he had allowed his tongue to hesitate the old man must have weakly broken down.

"But, father, I don't understand. You have not been under my roof half a day—not long enough to find out if you like it or not," remonstrated Henry, in tones of perplexed vexation.

Yet his father, searching his face, saw a flash of something like relief pass over it; and, having a key to an inner chamber of his son's mind, he did not blame him, but gently persisted.

"It's an old folks' notion, boy; no use to fight it. We're as homesick as dogs, and we will stay all night with you and then start back to the old place. It's a mistake when folks as old as we think of transplanting themselves to a new place."

"Father, I cannot bring myself to consent to this—this most unreasonable desire of yours and mother's being carried out," the distressed young man replied. "Come with me down to the station and we will have your things take to the house and nicely placed, then you will feel more at home, and so will mother, and all will be right and pleasant."

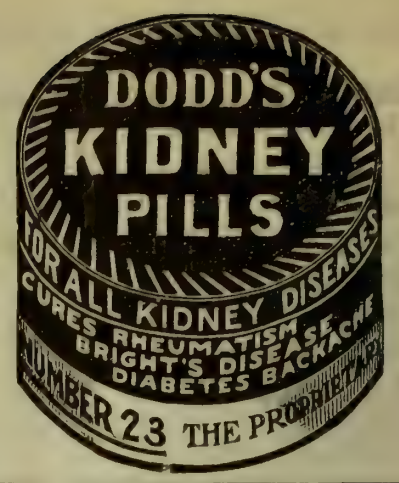
But no. Henry Cross saw that it was useless to try to persuade his father to alter his decision.

They went to the station, but it was to arrange for shipping their boxes back home—all but one.

"This is filled with country things which your mother and I thought you might like—apples from the old trees you used to like best, and a few extra nice vegetables."

The old man sighed as he thought that, having sold all their fruit and vegetables, they would be obliged to buy more to keep them through the winter months.

Henry's wife was delighted with the contents of the box, but her husband



A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations bladder weakness constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry. palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write today. Address: Mrs. M. Summers Box 309, Windsor, Ont.

I OWE MY HEALTH

To Lydia E. Pinkham's Vegetable Compound.

Washington Park, Ill.—"I am the mother of four children and have suffered with female trouble, backache, nervous spells and the blues. My children's loud talking and romping would make me so nervous I could just tear everything to pieces and I would ache all over and feel so sick that I would not want anyone to talk to me at times. Lydia E. Pinkham's Vegetable Compound and Liver Pills restored me to health and I want to thank you for the good they have done me. I have had quite a bit of trouble and worry but it does not affect my youthful looks. My friends say 'Why do you look so young and well?' I owe it all to the Lydia E. Pinkham remedies."—Mrs. Robt. Stopiel, Moore Avenue, Washington Park, Illinois.

We wish every woman who suffers from female troubles, nervousness, backache or the blues could see the letters written by women made well by Lydia E. Pinkham's Vegetable Compound.

If you have any symptom about which you would like to know write to the Lydia E. Pinkham Medicine Co., Lynn, Mass., for helpful advice given free of charge.

could never bring himself to relish the vegetables when they were prepared for the table; they seemed to choke him; and the sight of the well-remembered fruit brought tears to his eyes.

Information of the change in the plans of the old people was received by Henry's wife with unfeigned disapprobation.

Not until the old couple were well on their way home did the reason of their sudden return there dawn on the mind of their son. Then he said:

"Helena, do you care to know why your father-in-law and mother-in-law did not make a home with us, as they first intended?"

She noted the bitterness in his tone, andsaid nothing, but waited with questioning eyes for what he had to say.

"They overheard your learned disquisition on the subject of grandmothers—the danger of allowing them to nurse or caress their grandchildren."

Helena Cross blushed a fiery red. She knew her husband was right, and she would have given much to recall the words which had worked such mischief.

She was not so cruel or hard-hearted as not to realize what she had done and to regret it from the bottom of her heart. She was young and felt the importance of wife and motherhood, and had listened to too many well-meant but false and foolish teachings; and herein lies excuse enough for Henry's wife, whose punishment was quite adequate to her fault, or so her husband decided when, a few hours later, he saw her eyes red and swollen with weeping.

As for the father and mother who had so suddenly changed their mind, no tongue can tell how blest and sweet and altogether lovely the "little old tumble-down house," which had been so calmly deserted by them four days before, appeared now, as, in the golden light of an October sunset, they stopped before it.

"Oh, I'm so glad I didn't tear up or down anything," sighed Hester softly, wearily, yet delightedly, as she stepped inside the dear old kitchen door. "Jacob, are you too tired to run over to Bennett's and get the cat? They'll give her up—it don't seem quite like home without her—— Why, bless me, there she is! I might have known she'd see us coming. And now we'll unpack the things Henry made us bring, and have supper. Do get out from under foot, puss, till I get a fire built."

And Jacob, splitting pine kindling, kept his face turned aside from Hester that she might not see the happy tears in his eyes.

No one to welcome them, only the old cat they had deserted; yet for Hester and Jacob Cross it was a blessed homecoming.

Letters came at regular intervals from Henry during the winter, and each one was filled with news of the little child—all her little ways and wiles—bitter-sweet news to Grandma Hester. But through all ran an interlude of sadness; baby was not strong. She had illness after illness, and only partially recovered from each one.

By and by there came a missive that filled the two old hearts with mixed emotion. Baby was coming—baby and baby's mother! The letter, sweetly worded, was written by Helena.

"Will you kindly let us come, father and mother," it said, "and help me nurse the baby back to health? I am sure that in the sweet, pure old home that Henry is always telling me about she will grow strong, especially with a grandma to love and pet her."

Hester was struck dumb with joy and amazement. She was in the midst of her spring housecleaning, and in order to be ready to receive them on the date mentioned some extra effort and haste would be necessary. This was a small difficulty, however, as in addition to the strong woman already in the house, there were others to be had, and the "little old tumble-down house," in reality a low and old-fashioned but roomy and pretty cottage—pretty because of its setting of vines and flowers and thrifty fruit trees—was soon as thoroughly purified as could be, and shinig fnrom top to bottom.

And it came to pass that one day Helena Cross, weary, but pleased and hopeful, alighted from the old stage, and at the gate of her husband's old home met his mother and gladly surrendered into her arms the pale, precious baby, which grandma had never expected to see again till it had grown into a cold, stately woman like Helena had been before the deadly fear of losing her child had changed and softened her.

Grandma's constant care and country air soon accomplished the desired result, or well began it, so that when the autumn frosts began to ripen the nuts the fiat came forth from the busy husband and father in the distant city that baby and her mamma must come home, and with them the father and mother.

But after much thought and careful consideration the old folks decided that they were better off in their own homely old home, and that if they could have their beloved daughter-in-law and her child with them during each summer, the winters would pass by swiftly, mere seasons of joyful anticipation.

HOMESEEKERS' EXCURSIONS VIA C. G. RAILWAYS

TO MANITOBA AND THE CANADIAN NORTHWEST—CHOICE OF ROUTES — THE CLAY BELT COUNTRY.

Second class excursion return tickets will be sold every Wednesday until October 25th, to Winnipeg, Regina, Saskatoon, Calgary, Edmonton, and numerous other points in the Canadian Northwest. These tickets will be good for return within two months from date of issue. Full particulars can be obtained from any ticket agent of the Canadian Government railways.

Holders of these tickets have the choice of different routes. They can travel via Quebec and Canadian Government Railways to Winnipeg—the route of the Western National Express, or by the new "Transcontinental Line" via Toronto, North Bay, Cochrane, Ontario, and Canadian Government Railways to Winnipeg.

Homeseekers' tickets reading via Quebec will be good for stop-over at Doucet, Que., Hearst, Ont., and intermediate Canadian Government Railways stations, while tickets routed via Transcontinental Line will permit stop-over at Cochrane, Ont., Hearst, Ont., and intermediate stations, with the additional privilege of purchasing side trip tickets if desired at Cochrane for points on Canadian Government Railways east of Cochrane for points including Doucet, Que., at special low fare.

The above arrangements will permit passengers to inspect splendid new farming country in Quebec and the famous "Clay Belt" of new Ontario—a rich farming territory opened up by the new line of the Canadian Government Railways.

THE CURE OF THE SPOILED CHILD

In part of what I am about to say I may seem to be playing too frequ..tthou 88. . .0z7.2p| fwyp cmwfyp cm ly upon one or two strings. But though this may appear to be monotonous it is a monotony that cannot with safety be avoided. The physician, called in to attend a sudden illness of your child, will take the child's temperature, examine his pulse, inquire what he has eaten; and some such preliminary routine he will follow in every new case he is called in to treat however different may be the diseases. The same liberty of repetition I must also claim. The way to begin to cure a child of faults that may interfere with his best development is first to examine ourselves to learn if we have any character disease which may be a constant source of new infection to the child; and that if we have our cure must start with the cure of ourselves. Just so, if we would cure our spoiled child, we must begin by looking into ourselves; the spoiled child usually means a parent who spoiled him. If our child is spoiled, what is there in us that did it?

There may have been any number of things. Perhaps the greatset cause behind the spoiled child is the mother's unthinking indulgence during the earliest years of the child's growth, when his habits are forming. The mother may be unwilling, or may shirk, to meet directly and frankly the disagreeable situations which arise.

Rather than have an open conflict with her child, making clear to him once and for all what is expected of him, and what he can expect from others, the mother too often yields to the child's caprices, or satisfies his selfish, unreasonable demands. Thus each successful overawing of his mother strengthens the child's capricious selfishness. Or perhaps the child may have been sickly for a long period, and the mother may have felt that he could not be crossed, and may have arranged the life of the entire family so that it revolved around the child's life—and the child may have become aware that he was a little sovereign.

In such cases the cure must be started by the mother's realization of the injury her policy is doing her child. How one mother was brought to see the seriousness of such a situation as this, and how she handled it, may serve to suggest to other mothers how the tragedy of the spoiled child may be avoided. This mother had a son of eight, naturally bright and kind, but who unfortunately from birth had suffered from attacks of asthma; also she had a son of twelve, strong, generous, energetic, and with a keen sense of justice. Because of his misfortune the younger brother, Sam, was given the best of physical care, and was shielded by every precaution against overstimulation. Further, he was allowed to grow up with the understanding that his older brother, David, should yield to him upon all points—should, in fact, be almost his personal servant. Naturally he made demands on David which were unjust and unreasonable. If David would not at once obey, which sometimes he did not, Sam would instantly begin to cry, which invariably brought the mother to the scene. Fearing dreadful consequences from his irritation, she would put all the blame on David. Frequently, without question, she promptly punished the older boy for bringing on such situations.

For a period David received rebuke and punishment as a matter of fact. He was subdued by fear into believing in the dreaded consequences that might result from his brother's illness. But oe day when Sam's crying caused the mother to chastise David for some trivial offence that Sam weepingly announced, and the mother told David that as further punishment he could not play baseball that afternoon—baseball being his greatest pleasure—David stood for a moment as if dazed by what had happened to him. Then, as if moved by some force outside himself, he flung himself upon his little brother and pommeled him with all his boyish strength.

A scene followed between the mother and David which need not be described here; but David finally managed to express the injustice of the whole situation. Then he declared that he would not stand his mother's treatment or his brother's tyranny another day—he would run away from home. The mother, in an awakened agony for David, for the first time began to see what was happening—that little Sam was being made into a selfish prig, and that, as serious as was his physical trouble, even more serious would it be for him to grow up a spiritual cripple.

The mother decided then and there that, despite Sam's physical condition, he was never again to have his way if his way was unjust and unreasonable. She told him that from that day on, unless he could play justly and fairly, unless he could give as well as take in his play, he could not play with his brother; and, since his physical condition did not permit him to play freely at large, he would have to play all by himself in a single room at home. This program was strictly

Heart Palpitated

Would Have to Sit Up in Bed.

FELT AS IF SMOTHERING.

Mrs. Francis Madore, Alma, P.E.I., writes: "My heart was in such a bad condition I could not stand any excitement, and at times when I would be talking my heart would palpitate so that I would feel like falling. At night, when I would go to bed and be lying down for a while, I would have to sit up for ten or fifteen minutes, as I would feel as though I was smothering. I read in the daily paper of a lady who had been in the same condition as I was, and was cured by using Milburn's Heart and Nerve Pills, so I bought a box, and they did me so much good, my husband got another, and before I had used half of the second box I was completely cured. I feel as though I can never say enough in favor of your Heart and Nerve Pills."

Milburn's Heart and Nerve Pills are composed of the very best heart and nerve tonics and stimulants known to medical science, and are for sale at all dealers, or will be mailed direct by The T. Milburn Co., Limited, Toronto, Ont.

Price, 50 cents per box, or 3 boxes for $1.25

adhered to. The first time the mother discovered that Sam was unfair and selfish in his play she took him right out of the game and put him in a room entirely by himself. Sam was astonished at this change in his mother's attitude, and protested violently. The mother, though fearful of results, let him protest without changing her decision, and soon Sam learned that his mother was in earnest. Several such unpleasant experiences absolutely cured Sam of his habit of unreasonable demands, and also made life happier for all concerned.

The problem presented by one of my correspondents, of the child who "cries violently until he gets what he wants," is a very common one. The child who has this habit is almost invariably a child who has learned from experience that crying hard, and crying long enough, is the most successful method for securing his ends. Sometimes this practice originates from what some parents claim are absolutely unavoidable—one instance being a sickly child, such as I have just cited—which, the parents consider, require that the child be not irritated, crossed, or annoyed in any way. A child so treated quickly and aturally learns the great value to himself of showing irritation. This coddling in childhood usually develops a selfish, self-centered, self-seeking adult, who in the end pays a heavy penalty for it all by being generally disliked.

This use of the cry as a business method of the child is a comparatively simple variety of "spoiledness" to cure, if the mother goes at the affair whole-heartedly and does not allow herself to weaken and yield in the end. When the child wants a certain thing and begins to cry for it, if what he desires is just and right for him to have, under no circumstances should the thing be given him while he continues his fit of crying. The mother should say simply and firmly to the child: "Of course, Willie, you may have it just as soon as you stop crying." When the child meets the condition the promise must be kept.

On the other hand, if a child is crying for something that is wrong for him to have, or wrong for him to have at that particular time, the mother should, with equal frankness and firmness, tell the child that he cannot have it. If the child is old enough to understand reasons, give him the reasons; if not, make a clear, simple, brief, and direct statement, and let it go at that. The mother should go about her affairs, practically paying no more attention to the child. leaving him to cry it out. Crying will not hurt him. Except when frightened or physically injured, a child cries solely to attract attention. When he perceives that his crying is getting him no attention he wearies of the performance. After a few such experiences the child will learn that his mother means what she says, and that his crying will bring no results, and he will shortly give up this unpleasant practice.

A chief point to remember in this connection is that you must prove to your child, in your every-day relationship with him, that what is reasonable and right for him to have he shall have, and that what is wrong or harmful for him to have he cannot have under any circumstances. You must strive to establish in the child a perfect confidence in your sense of justice. And this confidence you can hope to secure only by first giving adequate thought as to what really are the child's rights.

The type of "spoiled child" who is destructive, who delights in teasing animals, or engaging in malicious mischief, is generally a child whose mental, ervous, or physical energy has not been constructively utilized or directed. Therefore his energy escapes in malicious and destructive activities. Back of all his "spoiledness" there may be only, or chiefly, a suppressed desire. The cure is obvious—an interesting and constructive outlet for his natural energy.

"Joe is impossible to have around the house; he is so incorrigibly mischievous!" a mother complained to me. "He simply takes the house apart. He meddles with every clock, lock, or screw, and we never know what awful thing is going to happen next." To illustrate, she told me of an unpleasant experience the family had had on account of Joe's wicked mischievousness in the early fall, when the steam had first been turned on. It seemed to them for a while as if the whole house was going to be blown up, for steam was escaping everywhere. Joe calmly came forward and announced that he knew what was the matter; that he had unscrewed certain valves to see what would happen, and that he knew how to fix those valves. This, to the mother's great surprise, he did. "And," concluded the mother, "I fixed Joe, to help him remember not to meddle again with the valves!"

It was very plain that what this "spoiled child" needed was not punishment or suppression of his mechanical inclinations, but a chance to make use of them. I advised the mother to have Joe join a mechanical class in a boys' club house in the neighborhood. I knew that in connection with that class the boys also had gymnastic instruction under a competent leader. This proved to be exactly what Joe needed. He found great pleasure in his new class room; he learned the use of certain mechanical devices there; and before very long Joe, instead of being an annoyance to everybody, became a very genuine source of pride to the household. He had a corner in the house which he called his "shop," whence emanated all kinds of original and ingenious mechanical toys.

The child who maliciously teases animals does it perhaps out of idleness, or because he has never been trained or taught to treat animals kindly, or because he has seen those about him careless and unkind to animals. Little children are cruel without meaning to be cruel or knowing that they are cruel. Kindness and sympathy for animals can best be developed in children through actual personal experiences. Every little child should have a chance, and should be required to care for some living, growing thing, animal or plant. Only through such practices can the finer human sympathies and instincts in the child be awakened and developed.—Miriam Finn Scott, in Good Housekeeping.

CONSTIPATION: THE ROOT OF MANY ILLS

Constipation is not a disease. Rather it is a condition of the system in which the bowel movements occur at irregular intervals, to the detriment of the body. Constipation has no specific cause. It does not result from any one body condition. Constipation therefore differs from a disease in that it may result from a multitude of things. Not infrequently it is due to some trifling derangement of the body functions. Again it may result from a serious organic disease. In some instances it is merely a bad habit.

It would be impossible to enumerate the many things which predispose to this condition. Nor is the cause in any particular case always constant. It may be due to one thing this week and to an entirely different one next week. Without apparent reason the bowel may become active. And with no obvious cause it may again become costive. Almost everything that affects the body may have an influence over the intestinal tract. Work, worry, nervous excitement, recreation, food, irregular habits of stool—in fact, everything that goes to make our daily life has an effect upon the bowel. Probably the most common cause of constipation is lazy, indifferent habits fathered by an ignorance of the necessity of keeping the gastro-intestinal tract active.

The character of food is an important factor. Concentrated foods, such as meats, sweets, pastry, and desserts, predispose to costiveness, while vegetables and foods with hulls and coarse fiber, with relatively large indigestible residue, tend to laxity of movement. Frequently costiveness results from the absence of sufficient fluids in the bowel.

But each person is a law unto himself. Each case requires a personal study to effect a cure, except when due to the most simple cause.

Since it is a body condition rather than a specific disease, it is evident that there can be no specific treatment.

Medicines will not cure constipation. But medicines will cause the bowels to move. So also will diet, massage, gymnastic exercise, suppositories, injections, etc., accomplish the same result.

But keeping the bowels active and curing the trouble are not synonymous. A remedy may give perfect relief daily, but fail utterly to effect a cure. And since the medicines may not cure this evil it is necessary that the remedy be repeated each day. Habit is an important factor in training the bowel to move at a certain hour of the day. But you must keep the appointment most promptly.

Necessity of keeping the bowel active is not fully appreciated. Few, indeed, regard such a matter as a means to health. Nor do people consider constipation as a potent factor in producing disease and sickness. To supply the body with food is no more important than keeping it free from waste materials. Nothing will lower the efficiency so much as holding within the bowel the waste products to be absorbed into the system.

Aside from these easily recognized results, there may occur many microscopic changes in the structural tissues. The condition known as rheumatism may be entirely due to—or at least it is intensified by—constipation. So also is high blood pressure, hardening of the arteries, liver and kidney disease, all kinds of headaches, coated tongue, a bad taste, and frequent bilious attacks. In fact, nothing will play havoc with one's health so quickly as habitual constipation.

With the conversion of the food into nourishment there is a breaking up of the structures of the food into soluble and insoluble materials. The digestible portion, which is the soluble part, goes to sustain the body. The undigestible residue, or the insoluble portion, constitutes the bulk of the dejecta. It is a fact well established that the bowel movement is stimulated by the bulk of the bowel content. So that if the foods are of

We trust any Honest Person. Write for Catalogue to-day.
JACOB BROS., Diamond Imp., 15 Toronto Arcade, Toronto

sufficient bulkly nature there is less likelihood of constipation.

To overcome this bad habit one should practice wholesome living. Time and patience are necessary to correct this trouble. If life is worth while it is worth living right, and to live right one must avoid all kinds of excesses. Have sufficient recreation, and especially abundance of outdoor physical exercise. Cultivate a taste for foods suited to your body needs, whatever they may be. But there is no need for you to become a crank about the matter if you use good common sense. Drink abundance of water, and, above all things else, have a fixed time for going to stool.

If you are constipated in spite of all of the health measures which you may adopt, it will be necessary to take medicines. It is very much better to secure a daily movement by the use of drugs than to allow the body organs to be destroyed by poisons from the bowels. The simple laxatives are not objectionable. They have no ill effect upon the body. But they become a nuisance and should not be required if we are living correctly. However, it is very much better to take them than to allow the bowels to go unmoved.

Bear in mind this one thing: that if your bowels are not active, it is because you have not been living right. If your daily habits of work, rest, recreation, eating, and drinking are such as make for right living and good health, your body functions will be more normal, and you will rarely require laxative medicines.—Julian Clarke, M.D.

CABBAGE ROOT MAGGOT AND ITS CONTROL IN CANADA

(Continued from page 669)

plant and just under the surface of the soil. In one instance 7 eggs were found about one-eighth of an inch below the surface, close to the stem. Others were found attached to the stem and in the soil close to the stem. The eggs were most commonly found in 1915 in groups of three and four. In some years oviposition in Ontario takes place earlier than the date above metioned. We have on record of eggs having been deposited in the beginning of the third week of May. The actual time of the beginning of egg deposition will cary, of course, according to climatic conditions.

Preoviposition Period

As mentioned previously, the preoviposition period is an important one, as upon it depends of the value of sprays of poisoned baits to kill the female flies before they have laid their eggs. Sanders recorded the oviposition period of the Imported Onion Maggot Fly as varying from 10 to 14 days.

Hibernation

The usual stage in which this insect passes the winter in Canada is apparently the puparium stage. The finding of living larvae in December at Ottawa, Ont., however, after winter had set in indicates that the insect also hibernates in the larval form. In the United States, according to some authors, it is stated that the winter is passed in the adult stage; but so far as Canada is concerned we have no records of the flies wintering over alive.

The Charlottetown Exhibition will be held on the 26th to the 29th of September.

ENGLISH APPLE MARKET DURING 1915-16

(Continued from page 668)

inspection must necessarily be made at long range, and is only regarded as a supplementary to the more detailed inspection at the quay. Quite frequently, however, some twenty or thirty apples are thrown to buyers who wish to examine them more closely, and if there is any doubt as to the condition of the fruit the whole barrel is emptied out and exposed to view in large baskets provided for the purpose. After this demonstraction of value the bidding begins, and the lots, usually 20's or 30's, are knocked down to the highest bidder.

Each of the six members of the Liverpool Fruit Brokers' Association, Ltd., takes his place on the rostrum for a definite period, and offers the fruit that has been placed in his hands to the same buyers. At the end of this period he must give way to his successor, and, if he still has anything to offer, wait till his turn comes round again. The rotation is arranged to that the first turn is given to a different broker each day.

The buyer has the right of rejecting for cause within forty-eight hours of purchase. If he has bought tights and is offered slacks at the quay, or if the sample shown at the sale was very manifestly superior to the apples delivered, rejection is in order. As a matter of fact, rejection for any other reason than misclassification is rare. Rejected apples are recatalogued and resold at a subsequent sale. Occasionally, instead of accepting a rejection, the broker may arrange a compromise on the price offered at the sale. As this would encourage haggling, it is seldom done.

In Liverpool auction sales are held regularly every Monday, Wednesday and Friday throughout the season, and the sales are usually largely attended and marked by active competition.

In Manchester the sales are held regularly every Tuesday and Thursday throughout the season. All the arrangements are quite similar to those in effect in Liverpool. This auction is also a closed one, and is attended by many of the buyers who attend the Liverpool sale.

In Glasgow there are two auction sale rooms, and sales are held with fair regularity twice a week throughout the season, usually on Wednesdays and Fridays. The Glasgow sales are not closed, but open to all who care to attend, retailers as well as wholesalers. Even the street hawkers or barrow women take part in them, though the fact that most of the apples are sold in lots of 20 or 30, or more, naturally restricts the operations of the smaller dealers, who buy principally samples or broken or rejected lots and the small parcels occasionally offered. As in Liverpool, the apples are classified on the quay by brokers' employees. Here also the larger buyers arrange to have a report upon the condition and quality of each lot before entering the sales room, but the practice is not so general as in Liverpool. Samples are also displayed at the auction as each lot is offered. The same rules are also effective as to rejections, and there is similar co-operation among the brokers to sell in turn to the same roomful of buyers.

In London the auction sales arrangements are by no means as good as at the other centres. The brokers do much of the selling by private treaty; the auction sales are held irregularly, and the most important difference is that there is no co-operation of the brokers, with sales from a single rostrum. Each broker holds forth at his own stand, and several sales may be going on at the same time, with the buyers divided among them all. There is a similar lack of system in the methods of classifying the apples, the catalogues in some cases not giving even the marks, which are considered of such importance at other auction centres as indications of value. The buyers simply base their bidding on the samples displayed at the auctions. The sales are open and may be attended by any one.

The Problem of Tights and Slacks

Canadian shippers are much interested in the system of classifying barrels of apples for auction sales purposes, and there seems to be a very general feeling among them that they scarcely receive justice in this connection. A shipper who believes, as most do, that his apples were properly packed when they were shipped is surprised, on receiving his returns, to find a varying proportion reported as slacks and the sales prices reduced on this account.

It should be clearly realized that although the percentage of slacks among reliable and experienced packers is comparatively small, there are many factors that tend to the production of slacks besides the actual packing. In a trans-atlantic voyage there is bound to be a certain amount of shrinkage, depending upon temperature, upon the degree of maturity which the apples have reached, upon their freedom from bruising or disease, and upon the variety. A delay in forwarding apples, which keeps them for ten days or so standing in a warehouse, rough handling when loading or discharging, further delays at their destination due to dock congestion or dock labor shortage, etc., are all factors which tend to produce slack packs, and some of these are such that the best packers cannot provide against them. As a matter of fact, the feeling against slacks among buyers on the market, and the comparatively low prices they fetch at the auctions, are due to the presumption, verified frequently by experience, that the slack or shaky condition of the barrel is an evidence of wastage or softening of the apples on account of bruising, over-ripeness, or some other serious defect. If the buyer can be assured that the apples are sound, and that there is merely a slight defect in the packing, he will often bid within a very small amount of a tight price. At the same time, it is the general feeling among the trade that it is not safe to buy slacks for reshipment on account of the deterioration due to handling in transit. Country buyers, therefore, as a rule do ot bid on slacks, which are usually purchased by wholesalers at the primary receiving centres.

The buyers at Liverpool are very much stronger and better organized than at any other auction, and they have accordingly insisted on a very strict classification of apple barrels. In Glasgow, where the buyers are not so well organized, apples are classified as tights, ticks, slight shakes, slacks, and wets. Apples are tested in the first place by tapping on the barrel head. If no hollow sound is heard the barrel is classified as tight. If a hollow sound is produced, the barrel is shaken. A slight murmur of movement causes a classification as tick, a greater movement shows a slight shake, and a distinct rattle a slack. The term wet describes itself. Although the tapping of the barrel

S.T. 114

head is used as the preliminary test in Glasgow, no barrel is placed in any other than the tight class on the strength of a mere tap. This first evidence must always be corroborated by shaking. In Liverpool, on the other hand, slack-tapping is the final test. Barrels are, indeed, frequently shaken, but the fact that no shake sound can be produced does not prevent a hollow-sounding barrel from being considered a slack. There seems to be no justification for this practice. In Liverpool, moreover, there is no such definite classification into ticks, slight shakes, shakes, and slacks as exist in Glasgow. Everything that is not tight or wet (i.e. the three Glasgow classes besides the Liverpool tap-slack that Glasgow would call tight) is put in a single category as slack. It is difficult to justify this system as fair to the individual shipper. There is something to be said, however, for the brokers' defence They point out that the more minute classification would be much more difficult to carry out with accuracy, with the result that the percentage of rejections would be greatly increased. They also claim that the catalogue classification affects the bidding very slightly, as few buyers take part in a sale without a special report from their own men as to the condition and quality of the several lots. Thus the buyers are well informed as to whether the particular slack being auctioned is merely a tap slack, a tick, a shake, a slight shake, or a slack, and this information has its effect on their bidding.

Canadian Cargo Inspections

Canadian apple shippers owe a great deal to the thorough, painstaking work of the Canadian cargo inspectors at London, Liverpool, Manchester, Glasgow, and Bristol. These officials are on hand at the discharge of every apple boat, and make it their business to see that there is no undue rough handling in unloading the barrels. Their influence is a very real and definite one and has been especially valuable during the past season, when labor shortage has resulted in the employment of a constant succession of new and inexperienced men at the docks In many instances the action of the inspectiors has been effective in securing a change for the better in the methods of handling the apples. The value of these services will be realized when the important part that rough handling plays in the production of slack barrels is considered.

Special Difficulties and Handicaps

During the past season shoppers have had to contend with a great many difficulties and handicaps due to the present abnormal war conditions. These have included restricted shipping space, very high freight rates, dock congestion, and dock labor shortage, with consequent delays in discharging, increased rates for cartage, increased handling charges, difficulty in obtaining railway trucks for reshipment to inland centres, etc. In some cases apple boats have been in port eight to ten days before they could be unloaded, and apples have been kept for long periods on the quay, delivery being impossible on account of shortage of facilities. In Liverpool dock congestion difficulties finally culminated in a strike of the laborers, which fortunately did not last very long.

Proposed Embargo on Fruit Importation

The trade was very much alarmed late in January at the announcement of the president of the Board of Trade that the government was contemplating taking measures to prohibit the importation of some fruits in order to release shipping tonnage for the conveyance of commodities considered of more value to the community. The Canadian High Commissioner, the Agents-General of all the Canadian fruit producing provinces, and the Fruit Trade Commissioner all made representations to the government pointing out the very serious effect the proposed embargo would have upon the important apple industry of Canada. The Australian government and a deputation from the wholesale fruit trade also took a strong stand against the proposed fruit restrictions. As a result of these representations, it was announced that the importation of fruit from the colonies would not be prohibited.

The Transportation Problem Next Year

Although one menace to the apple industry is thus satisfactorily disposed of, it is clear that great difficulty will be found in securing sufficient shipping space next year for apple transportation. During the past season this difficulty was sufficiently serious, but it seems likely that next year a tonnage diminished by war requirements and by submarine activities will have to take care of a much larger offered output. Shippers will therefore be well advised to give their earnest and early attention to finding some solution for this problem.

Apple Statistics

The total apple arrivals at the principal ports of the United States and Canada during the season of 1915-16 were as follows: Liverpool and Manchester, 652,944 bbls; London, 383,938 bbls; Glasgow, 330,975 bbls; total, 1,367,857 bbls. Of these totals the following quantities came from Canada: Liverpool and Manchester, 179,534 bbls; London, 222,886 bbls; Glasgow, 89,006 bbls; total, 491,426 bbls. Canadian apples therefore formed nearly 36 per cent of the total arrivals from America. For purposes of comparison, all box arrivals have been included in the above figures, reckoning 3 boxes to a barrel.

The following tables give the Canadian apple arrivals in greater detail:

From Ontario

	Barrels
Liverpool and Manchester	54,538
London	1,794
Glasgow	69,987
Total barrels	126,319

	Boxes
Liverpool and Manchester	6,631
London	2,657
Glasgow	10,586
Total boxes	19,874

From Nova Scotia

	Barrels
Liverpool and Manchester	121,575
London	218,290
Glasgow	14,358
Total barrels	354,223

	Half Barrels
London	320

	Boxes
Liverpool and Manchester	1,846
London	1,888
Total boxes	3,734

From British Columbia

	Boxes
Liverpool and Manchester	1,786
London	3,380
Glasgow	3,395
Total boxes	8,561

The figures of apple arrivals (in bbls) from Canada and America during the past three years are given for purposes of comparison:

Year 1915-16

Liverpool	527,547
London	383,928
Glasgow	330,975
Manchester	125,397
Total	1,367,857

Year 1914-15

Liverpool	1,050,359
London	646,957
Glasgow	522,158
Manchester	211,351
Total	2,430,825

Year 1913-14

Liverpool	642,695
London	426,884
Glasgow	362,435
Manchester	88,934
Total	1,520,948

GRAND CREAMERY PICNIC AT MARGAREE

Tuesday, July 11th, was a busy day in the Margaree Valley. The demonstration creamery erected by the Nova Scotia Department of Agriculture during the summer of 1915 and opened for business this spring, was the medium for the gathering of the people from all parts of the Valley and many from other parts of Cape Breton Island, to meet together in one grand picnic, the last of a series held in connection with creameries in the province.

The day proved fine, and this beautiful valley was looking its prettiest with all the different shades of green on the hillsides newly washed by the recent rains, and the hay and crops in the valleys below looking their very best. In the early hours of the morning the crowds began to assemble, and by noon it was estimated that there were fully 1,500 people on the picnic grounds adjoining the creamery. All enjoyed a visit of inspection through the new plant, where they met the creamery manager, Mr. Sweeney, and his assistants, and were shown the different processes through which the product passed in being manufactured into the large piles of delicious yellow butter. A tasty lunch prepared by the ladies of the Margaree Valley was served on the grounds, after which all interested adjourned to the western end of the field, where a meeting was called to order by Rev. Dr. MacDonald, and addresses of a practical nature, touching on all the phases of the dairy industry were delivered by W. A. MacKay, George H. Barr, Chief of the Dairy Division, Ottawa; Prof. Trueman, Harvey Mitchell, and Prof Cumming. Premier Murray, who was in specially good form, delivered the closing address of the afternoon, speaking enthusiastically of the possibilities and adaptability of the Margaree Valley for the development of dairying, pointing out to the people the splendid opportunity that was opened up to them through the medium of this creamery, and expressing the hope that the development would be in proportion to that which was warranted by the possibilities. This part of the program closed with a vote of thanks to the speakers and three cheers for Premier Murray.

The balance of the day was spent in different forms of amusement. Dancing was carried on to the skirl of the pipes and the strains of the violin. In the evening all went home feeling that they had not only spent a pleasant day but a profitable one as well, and convinced that this new form of picnic was very much in advance of picnics which were given over entirely to pleasure-seeking purposes, and all had the conviction that agriculture had received an impetus that would eventually bring the Margaree Valley to the forefront of agricultural communities in Nova Scotia.

YOUR HORSES' TEETH

George Klein, a veteran breeder and importer of draught horses of years gone by, used to say that many a farmer was wasting large quantities of grain because he did not have his horses' teeth looked after periodically. Just recently a farmer gave us the following experience in confirmation of this: One of his horses, ordinarily an easy keeper, began to go down in flesh despite heavier feeding. She did not appear well, and did not shed her coat as usual in the spring. Later in the summer he took her to a veterinarian, and when her mouth was opened it was found her teeth had grown out sharp and one cheek was raw and badly inflamed. The wonder was that she could eat at all. The teeth were put into good condition, and two weeks later she had gained in weight, had commenced to shed her coat, and her general condition had improved. Instances of this kind could be multiplied many times. If you have no already done so, try a little teeth insurance on your horses and note results.

Supplying range food for chicks will make it possible to realize more poultry profits and keep the young stock in a healthier condition. Where the chicks cannot run on a range, provide sprouted oats. For temporary feeding one can soak oats over night and spread them in thin layers on trays where it is light and warm. In four or five days the oats will be ready for feeding. Rape may be grown easily in the chicken lot where the chicks can snip it; or it may be cut and fed in their pens. Cabbage, lettuce, mangels, beets and turnips can also be used for green food. A frame made of one-inch mesh wire netting, placed over growing plots, will allow chicks to snip green food without scratching seed.

DU PONT FABRIKOID

MOTOR QUALITY

The Standardized Automobile Upholstery

DU PONT Fabrikoid, Motor Quality, is used on more than half of all 1916 automobiles.

Several years' use on hundreds of thousands of cars has proved its superiority over coated splits, commonly called "genuine leather."

Popular motor car prices are low because every detail of their manufacture is of *standard guaranteed* quality and cost.

Coated splits, weak and irregular in quality, durability and price, cannot be standardized.

Motor Quality Fabrikoid, uniform in quality, price, durability and handling costs, *is* standardized.

Insist upon Fabrikoid upholstery. Buy a standardized car and get the most for your money.

Send for samples and booklet

DECLARE WAR ON WEEDS NOW

The five weeds occurring most frequently on the 400 farms visited by the Conservation Commission in 1915 were Canada thistle, couch grass, wild mustard, ragweed, and sow thistle. One hundred farms were visited in each of four counties, viz., Dundas, Carleton, Waterloo, and Northumberland. In many instances the weeds were very bad and increasing at an alarming rate. In Dundas 98 per cent of the farmers visited reported wild mustard; 88 per cent reported sow thistle, with 26 per cent showing it increasing. In Carleton 89 per cent reported couch grass; 77 per cent reported sow thistle, with 22 per cent reporting it increasing. Conditions wesre as bad in the other counties, but these examples serve to show the real seriousness of the problem and the need for concerted effort to deal with it.

To succeed in eradicating weeds one must have a knowledge of two important points: how long the plant lives, and how it reproduces and spreads. Regarding duration of life there are three classes of plants: Annuals, biennials, perennials.

Annuals come up from seed, bear flowers and seeds, and die, all within one year. Biennials grow from seed and produce only leaves during the first year. The roots and sometimes the leaves live through the winter. The second year a flower stalk comes up, and seeds are produced, and the plant dies. Perennials are those whose roots ordinarily live on year after year. The plant may or may not produce seed every year, according to conditions.

Practically all annuals reproduce by seeds only. Biennials also, except during the winter, when the roots are in the ground, reproduce by seed. Perennials propagate by means of the roots, or by roots and seed.

Means of Control

Annuals and Biennials:

1. Cutting or pulling.
2. Thorough tillage of cultivated crops.
3. Rotation of crops.
4. Spraying with chemicals.

Perennials:

1. Summer fallowing.
2. Partial summer fallowing and smother cropping.
3. Thorough cultivation with crop.
4. Smothering with tar paper, etc.
5. Application of salt brine, gasoline, etc.

Farmers, townspeople, and municipal authorities alike should put forth every effort to control the weeds before they get the upper hand. Enlist today, and join whole-heartedly in the fight against our common enemy, the foul weed.—F. C. N.

COLIC IN HORSES

Colic is almost always found among farm horses, and, like many other diseased conditions that are commonly met with, many people have come to regard it is unavoidable. An odd case of colic may possibly be unavoidable, but there can be no hesitation in saying that where colic is frequently on a farm it is due to avoidable causes. Some men never have their horses affected with colic, while others never seem to be without it. To such men we would say: "Don't waste time and money looking for the best colic drench on the market, but sail right in to discover what is the cause of the colic, and when found remove it." Understand that good management will chase it off the place and keep it off. When farm horses were only worth $60 and $75 the loss of one may not have been a very serious matter, but when good draughts now bring $250 to $300 no man can regard their loss with equanimity.

A veterinarian when called in to a case of colic will always make inquiries as to the treatment of the animal for the last day or two prior to the attack. He will go carefully into the work performed, asking for particulars as to weight of load drawn, number of hours worked, what feed was given, and the intervals between feeds, when the horse was watered, etc. This is not idle curiosity on his part, but simply a desire to know what caused the attack in order that he may deal with the condition without loss of time. He could treat the case without this information, but a knowledge of the cause affords him great help. We want to draw attention to this because if a knowledge of the cause is of use to the veterinarian in treating colic it should be useful to the farmer, as it would enable him to prevent the complaint altogether. Let us examine some of the common causes of colic. First comes unsuitable food. It is a fact that a horse will digest and thrive on almost any food that is digestible; but it is also a fact—too little known—that a horse is only capable of digesting any variety of food when he becomes accustomed to it. The reason of this is that each variety of food causes the formation of a particular kind of digestive juice capable of dealing with it, and that the horse will only produce this digestive fluid as he becomes accustomed to the food. In spite of this knowledge, one continually comes across men advocating a change of food for horses, thereby laying up no end of trouble for themselves. Provided the food is of good quality, the less change the better. If a horse has been accustomed to oats, a sudden change to maize and bran would result in indigestion, an irritable condition of the bowels shown by diarrhoea, and all the foundations for a serious attack of colic are laid. It may as well be here stated that it is not often that colic is due to a single cause; it is generally a variety of circumstances. For example, a horse gets unaccustomed food, which causes indigestion; on top of that he does a long and exhausting day's work, which has the effect of still further lowering his powers of digestion; and when after the day's work he receives still more of the unaccustomed food, the chain of circumstances is complete, and he gets colic. A firm of carters werer continually losing horses from colic, and were not able to account for it. On going into the matter for them everything was found correct bar the following very important part: The horses were fed on a big feed before going to work, and were not fed again until they returned to the stable. The time away, owing to the nature of the work, varied, and often exceeded 12 hours, and on return the horse received a big feed of good quality. Scarcely a night passed without one or more cases of colic.

A horse that has worked all day without food comes into the stable exhausted and ravenously hungry. He is in no state to digest a little feed, but gets a big one, which he promptly bolts without an undue amount of chewing. Result—colic. The remedy applied, and which proved effective, was simply to carry a nose bag and at every possible occasion to give the horse a little feed. By this means the horses were prevented from getting exhausted, their stomachs were never allowed to get empty, and they were not tempted to overload them by bolting large quantities of feed on returning to the stable. This is simply common sense based on the knowledge that a horse has an extremely small stomach, which consequently requires constant refilling. When grazing, a horse will feed twenty hours out of the twenty-four, and it is unreasonable to expect him to get through in about two hours what in a state of nature takes him twenty. If you attempt to make him go against nature's laws you will cause him to overload his stomach with bad results. The lessons to be learned are obvious and are: (1) Only give the horse food he is accustomed to, and if from any cause you find it necessary to change from one food to another do it gradually, starting with small quantities of the new food, and only increasing the amount given as you become convinced the animal is getting used to it. (2) When working, feed a little and often. Watering also has a great influence on colic. Probably most people know that a horse should be watered before feeding, but many do not know the reason for this, which is as follows: When a horse drinks the water does not stop in the stomach, but goes on through the small bowels to a sort of water reservoir. As a horse drinks several gallons at a time, it follows, if the stomach is full, that a large quantity of undigested food is washed out into the small intestines and may cause serious trouble. This is avoided by watering before feeding. After a hard day's work the horse wants water badly, and should certainly get it, as he can't take his feed properly till he does get it. Often the water is some distance from the stable, and instead of being driven down for a drink before feeding the horse has to wait till later, when, with a full stomach, drinking may do him harm.

START TO TRAIN THE YOUNG COLT THE DAY IT IS BORN

Begin to train the colt before it is a day old. Handle and pet every day if possible. In handling always keep a firm hold and let the colt know from the start you are the "captain" in each of your steps of training. Never let the colt know its strength in breaking away from you, because then there is trouble ahead. The lesson is not forgotten. Halter train the colt before it is a week old, using a small, strong rope halter or a leather one made colt size. Hitch the colt to something solid and let it pull all it will. In a short time it will be as quiet as a lamb, and no more pulling, and a very small cord would be sufficient after it finds it cannot get away. Handle legs and heels as if horse is not safe anywhere. Watch the solt closely when tied, as there is a possibility of its casting itself.

Pet and handle the colt from head to heels. Handle legs and feet as if

When there is no head to the top of the Flour barrel, what do you know about the contents? Nothing!

But when you see that the top bears the "REGAL" label, you are sure you are getting good flour, which carries a money-back-guarantee of satisfaction that insures you against baking failures.

LIGHTER DAYS IN STORE

FOR THE HOUSEWIFE

There are too many excellent features about "THE LIGHTER-DAY" HIGH OVEN RANGE for us to attempt to give description or to point to any outstanding quality in this ad.

There is a "LIGHTER-DAY" on display in our Show Room (next door above our plant), and you are at liberty to call in and ask for demonstration and information any day.

THE SMITH FOUNDRY CO., LTD.

King Street. 'Phone 55. Fredericton.

being shod. Do this before the colt gets strong enough to pull away from you while tied. As soon as the colt will feed from your hand give it some salt and sugar. Older colts are tamed and controlled by the use of a few drops of the oils of rhodim and cummin rubbed on their noses, as when inhaled it has a very soothing effect.

There is but little trouble to train colts to the harness when handled from their youth up; neither are they likely to become kickers, as they have been educated at both ends. I am quite partial to the use of the bitting harness, as the body of the colt is more pliable to the reins in driving. The colt's body has to turn with the head, and so it is more pleasant to drive with the bitting harness. Recollect the colt's lips are very tender, and do not check too short at first. When at pasture carry a dish of grain and give all, old and young, a taste. There will be no trouble then to halter a horse. Colts and the old horses will welcome your coming and be your pets for evermore.—T. D.

CONTROLLING LICE AND MITES

Lice: The ordinary hen louse, of which there are eight species, is almost universally present in poultry flocks. Their life history is comparatively simple, and spent entirely on the host, where the eggs or "nits" are laid and hatched.

1. Blue Butter.—The most convenient and one of the most effective methods of eradicating lice is by poisoning with a mercurial ointment commonly known as Blue Butter. Blue Butter may be purchased at any pharmacy and is made more efficient and easy of application when mixed with twice its bulk of vaseline. A piece about as large as a pea should be taken on the finger tip and applied to the hen just beneath the vent. Care should be taken to spread the salve around well, so that the bird cannot eat it. One application is all that is necessary, because the nits that hatch, as well as the adult lice, are killed by their first feed of Blue Butter.

2. Dusting.—Lice breathe through little holes or spiracles in the sides of their obdomen. Advantage is taken of this in killing them by choking these breathing pores with a fine dust. Such is the function of a dust bath or lice powder. Commercial lice powders may be purchased, but they are rather more expensive and less efficient than Blue Butter. In using any lice powder it should be remembered that one treatment is not sufficient. It is necessary to repeat the application in a week or so in order to catch the "nits" or eggs which hatch after the first application. The best lice powder known to the writer is made by mixing the following materials and allowing the crumbly mash which results to dry into a fine powder. It is not only effective in clogging the breathing pores, but the fumes of carbolic increase its destructive power.

Ingredients of home-mixed lice powder: One part crude carbolic acid or cresol; three parts gasoline; plaster of paris to absorb; mix into crumbly mash and let dry in sun to a fine powder.

3. Dipping.—A most effective but rather bothersome method of eradicating lice consists in submerging the fowl, head and all, for a few seconds in a water bath containing ½ per cent carbolic acid or stock-dip. This should be done early on a bright, sunny day, so as to allow sufficient time for the birds to dry off before night.

Red Mites: The Fowl Mite, commonly known as the Red Mite, because of its reddish color when filled with blood, is one of the most destructive pests with which poultry has to contend. These mites inhabit the entire house, but most especially the roosts and surrounding walls. At night they suck blood from the fowls, and in the daytime live and breed concealed on the under side of roosts and in neighboring cracks.

Clean, dry, well-ventilated houses which get plenty of sunlight are seldom badly infested. The first step in controlling the pest is to thoroughly clean the house. Remove all droppings and old nesting material and scrub off any filth. Then spray or paint the perches, walls, and nests.—William C. Monahan, Extension Instructor in Poultry, University of Maine.

SANITATION IN THE HOME

Education regarding matters of health are becoming more and more widespread, and as a people we have leaped beyond the "plagues and pests" which swept out whole communities in the middle ages.

We look with horror upon the record of the fourteenth century, when twenty deadly epidemics, followed by famine, visited Europe and swept away millions of the population; but progress is slow, and even today the condition of some of our public homes for the poor, county poorhouses, and the like are being investigated because they do not come up to the twentieth century standard of cleanliness. As individuals in our homes we are often careless of the essentials of health, and we disregard many of the requirements which would make for comfort and sanitation in our community.

Our modern diseases of colds, pneumonia, disorders of children, weakness left after contagious diseases, etc., are often due to bad location and poorly cooked food, while the great white plague—tuberculosis—we know depends greatly upon sanitation, and modern investigators of health conditions are bending every nerve to wipe out this disease.

The first requisite in choosing a home is a good location. In the country we frequently see farmhouses on poor building sites where damp soil or a natural hollow in the ground makes an unwise foundation; yet on the same acreage are perfect sunny spots, perhaps on some hillside slope where the drainage would be perfect and the full benefit of God's air and sunshine be obtained.

In the up-to-date house let there be plenty of windows, for perhaps the best text of sanitation is summed up in the words "fresh air."

In choosing a house one should select a dwelling with a good dry cellar. Too often a damp foundation is the cause of many minor illnesses in the family.

But most important of all, in city or country, is the necessity of complete fumigation before entering a house whose previous tenants were unknown. This is a simple precaution, yet one frequently unheeded, and we have known of families with little children moving into a house where some one had just died of consumption without considering this necessary means of protection against the dread germ which might be lurking within that dwelling.

Where one is already established in a home, and the best must be made of prevailing conditions, there are many questions of sanitation for our consideration.

Outside the house comes the question of drainage. In the country the family well is often a source of danger to health. A little care taken in the location of the well, so that drainage from stable and outbuildings will flow away from it rather than toward it, will prevent much sickness and future misery. The proper well is fenced off so that domestic animals cannot get to it, and it has a tight cover of cement. If the water supply is pure to start with there need be no further anxiety about the water supply. Wise inspection, and the spring housecleaning should include barns and outbuildings. Their interior should be whitewashed and all refuse removed. Not only will this improve the looks of the farm, but there will be fewer flies to torment the housewife. Flies are sure to breed in stables where unsanitary conditions exist.

In providing milk, one should take all precautions both as regards the health of the cows and the cleanliness of milk conditions. Oversight on the home farm is easy in this respect, but if the milk is bought there should be the same knowledge that it comes from pure surroundings.

The question of drainage of the ground also makes a difference regarding life on the farm, for flies, mosquitoes, etc., breed in any near-by sloughs and low, wet spots with alarming rapidity. The swampy hollow should be drained or filled and the bushes cut away. This will make a great difference within a short space of time.

Inside the house the careful housewife begins at the bottom regarding home sanitation. The cellar should be her first consideration. Have the cellar carefully whitewashed once a year. Be careful that there are no rotting vegetables or plants left there forgotten when the cellar has its regular inspection and if there are unpleasant odors or escaping gas from pipes, find out the source of the difficulty without delay. If damp spots appear on the cellar bottom or on the walls, the drainage is to be suspected and care taken to have the leakage carried off in some other direction.

The old-time housekeeper kept the blinds in her front rooms down that the sun might not hurt her carpets. The sanitary housewife today prefers bare floors and rugs to carpets; or where carpets exist their coors must stand the rays of the sun, for the health of the family is of more consideration than the lasting hues of any ornament in the home. Sunshine and fresh air—let them pour in.

Strange as it may seem, every individual contributes his or her share to this question which makes for weal or woe in a community. Personal neatness, bright, sweet houses, care of the garden plots about our homes—these are all silent witnesses of our belief in the powers of cleanliness which war against unhealthy conditions, which others, seeing, may imitate.

A little care, a little thoughtfulness, plenty of fresh air and soap and water, good, well-cooked food and a cheery heart—this is the recipe for "sanitation in the home" that any housewife can learn, thus saving doctors' bills and promoting the health and happiness of the nation.

The cost of fattening and finishing cattle of good beef type is much less than fattening and finishing cattle of poor quality.

High grade sires produce high grade beef cattle, and good results cannot be obtained by the use of inferior animals.

WM. CLARK & SONS
North Wiltshire, P. E. I.

SYSTEM IN PICKING RASPBERRIES

In picking raspberries, we number the rows, then assign two pickers in each row, and keep a chart and record at the packing shed. In a field of 40 to 60 long rows it is very difficult for pickers to find their own row after taking a carrier of fruit to the packing house unless the rows are given some distinguishing mark or number. By this plan we know just what rows are picked, and can check up the work of each picker.

Our pickers use four-quart carriers and as soon as the baskets are filled they must bring them to the nearest packing shed and have their card punched before they receive any more baskets. Pickers are not allowed to take any extra baskets with them to the field.—George D. Aiken.

RAISING POTATOES ON BRAN

An old farmer tells me that bran makes an ideal fertilizer for potatoes, bringing a good yield of clean potatoes. What about it?—J. W. R., New Hampshire, in New England Farmer.

Answer: A number of farmers use bran for this purpose. The question is answered by Prof. F. W. Taylor, of New Hampshire College: Wheat bran contains 26 per cent nitrogen, 2.9 per cent phosphoric acid, and 1.6 per cent potash. At the normal price of these fertilizing constituents a ton of bran would contain about $19 worth. At the price of them in this year's mixed fertilizers a ton of bran would contain about $28 worth. In view of the fact that these fertilizing elements exist in an unavailable form in bran, their value should be discounted about 20 per cent, which would give a ton of bran a fertilizing value of about $15 in normal times and about $23 this year. We have never used bran as a fertilizer in any of our potato experiments, but it seems to me that it would be better economy, in view of the fact that 80 per cent of the fertilizing constituents of a feed reappear in the manure, to utilize the bran first as a feed and then apply the manure as a fertilizer.

Clean water and salt before stock all the time—an important item.

It is expensive to feed hog lice, and a man can't sell them for port, either.

Every time a man starts in business for himself he learns a lot of things he would rather not know.

Calendar on Application.

E. A. A. GRANGE, V. S., M. S., Principal

R. O.M. and R. O. P. Holsteins

Would you like to get a good foundation? Holsteins of this calibre are seldom offered at any price, but we are overstocked and will offer::—

2 Daughters of "Ruby Nig" whose 7 day record is 567 lbs. milk, 25.60 lbs. butter; yearly record, 16,555 lbs. milk, 750 lbs. butter; the second highest record in Canada at 3 years of age.

2 Daughters of "Black Rose Beauty" whose record is 522 lbs. milk, 24.60 lbs butter in 7 days.

2 Daughters of Miss Rooker Posch, whose record is 402 lbs. milk, 16.114 lbs. butter in 7 days; 12,268 lbs. milk, 600 lbs. butter in one year, when 3 years old.

2 Daughters of Beauty Rooker, whose record at 2 years of age is 322 lbs. milk, 15½ lbs. butter in 7 days; 11,248 lbs. milk, 517 lbs. butter in one year.

And several others of equal breeding, sired by or bred to "Ida Rooker 2nds Vale," a sperior animal in every way and a proven producer of rich milkers. Also some extra nice bulls of the above breeding, all at reasonable prices.

LEA & CLARK, Victoria, P. E.

SPRINGVALE HERD

Of choicely bred Ayrshires, Dairy Test Winners, herd numbers 30 head. Before buying, come and inspect our herd and get prices.

FRED S. BLACK & SONS,
AMHERST, N. S.

Maple Green Farm Holsteins

To avoid inbreeding, we now offer for sale our senior herd bull "Maple Grove Mercena Mercedes," coming 5 years old; weight about 2500 lbs., active, sure and exceptionally kind. His first daughter to be officially tested made 15.46 lbs. butter in 7 days at 1 year and 11 mos.; another at 2 years and 2 mos. was making nearly 3 lbs butter per day when she met with an accident and we had to drop testing her. His dam gave 12664 lbs. milk and 568 lbs. butter at 2 yrs. old in the R.O.P., and her sister Posch Mercedes Springbank 2nd, is the Canadian Champion 4 yr. old in the R.O.P. with 22000 lbs. milk and over 800 lbs. butter in the year. We are also offering Bull and Heifer Calves sired by him and "King Lyons Colantha" and out of high-class Record of Merit and Record of Performance Dams.

For further particulars write

R. L. HICKS
Dalhousie Jct., - N. B.

Springbrook Ayrshires !

Present offering several choice Cows and Heifers, all ages, and Bulls ranging from 6 to 17 months, sired by our imported prize winner, Grange Kelly, and out of some of the best cows we ever owned. We have also two choice Bulls, about 15 months old, sired by Springbrook White King. We can also sell some nice grade Ayrshire Cows, fresh or about to freshen.

Write us your needs in the Ayrshire line—we have started many young breeders on the right track and have replenished the herds of some of the older breeders. We can supply your wants.

See our herd at the Halifax Exhibition or better still come to see our herd in home quarters. Interested parties always welcome.

McINTYRE BROS.,
SUSSEX, N. B.

BUFF ORPINGTONS

I have changed my place of residence from Amherst to Oxford Jct. N. S. and am better prepared than ever, to supply those wishing Buff Orpingtons stock or eggs, the ideal table fowl and winter layers. Our winnings at the Maritime Winter Fair against strong Competion were as follows 1st cock 1st hen 1st cockerel 1st 3rd pullet, 2nd utility Cockerels 1st & 2nd utility pullets and 1st pen.

Our breeding pens are mated as follows

PEN NO. 1 Headed by "General Joffer" 1st cockerel at Halifax, F'ton, and Amherst mated with the 1st pen at the same shows, with 5 others of equal merit. Eggs $3.00 per 15

PEN NO. 2 Headed by "Kitchener" 1st Cock at Halifax, F'ton, and Amherst mated to the 1st 2nd Pullets with six others just as good. Eggs $2.00 per 15.

PEN NO. 3 Headed by "Prince" never shown, but an exceptionly fine utility bird good eye, color right through with lots of size mated with the 1st & 2nd pairs of utility pullets at Amherst 1915 with others that will produce stock that will fill your egg basket next winter Eggs $1.50 per 15

All infertle eggs replaced free of charge

GOOD ROADS AND MARKETS

Both Essential for Farmer's Prosperity

Under the caption "Good Roads and Markets," in the June number of Vertical Farming, a monthly publication issued by E. I. du Pont de Memours & Company, the explosives manufacturers, of Wilmington, Delaware, Leigh Mitchell Hodges gives some valuable hints on the importance of good roads to the farmer's prosperity. We publish the article in question in full, and trust that it may be the means of helping to start a strong campaign for better roads in our rural communities. Better roads are needed badly.

Mr. Hodges' article follows:

Every farmer has Siamese twins.

One is crops—how to raise the most of the best for the least.

The other is marketing—how to sell the most for the most.

The band connecting these two is ROADS.

Byroads, highroads, and railroads.

As a rule, the farmer's concern ends at the railroad.

In most cases the byroad is his chief concern because it's the one nearest him.

It's the first link in his chain of transportation—the front door yard to his market.

Eight months in the year the average highroad—main artery of travel—is in at least fair condition. Not what it should be in this greatest of productive lands, but "navigable."

The farmer whose acres fringe such a road has the small end of the problem. A minority of farms are so favored, however. Most of them lie from one to five miles off this beaten track.

These are the miles that multiply the average farmer's hardships. They constitute his biggest problem, speaking marketwise. And manywise.

I know a farm in the north central part of Pennsylvaia that grows phenomenal crops. It yields "bumpers" year after year; yet man after man has failed on it and no one wants it.

Between it and the nearest railroad station are five miles of muddy, rutty grades. That haul eats profits as a dog eats stale fish.

The last owner sold it for less than he paid, and moved to a comparatively "poor" piece of land—with three miles of good road between him and "freight on board."

He raises about half as much and makes about twice as much money.

Just a difference in the byroad. That's all!

I know a man who has gone carefully into the figures of this road question. You know him, too. We call him Uncle Sam. And Uncle Sam, through his Department of Agriculture, says the farmers of this land are losing a total of $250,000,000 a year because of markets rendered inaccessible by bad roads!

A quarter of a billion dollars lost every twelve months — $33,000 for every hour of every weekday—because of the weakness of this link that binds the farmer to his market.

Even a poor business man will admit this is not good business. But what are we going to do about it?

That's up to the farmer, for in a great majority of cases this huge loss is due to unfit byroads which do not come in for state or federal aid or supervision. In many cases they are the absolute property of the farmer, who is responsible for their condition and upkeep.

The farmer's short cut to a market is to turn road builder!

The nation's short cut to prosperity of the lasting sort is road building. That this is appreciated is evidenced by forty-three state legislatures last year spending a large part of their time with road legislation.

Such attention is needed, for in this land of unparalleled productivity only onetenth of our total state highway mileage is surfaced.

If we could get a **byroad** statistics, probably we'd find less than one one-hundredth surfaced.

Probably we'd find the 99 per cent undrained, ungraded, bristling with rocks and stumps, and menaced by deep cuts or gulleys. Also rendered inefficient in the highest degree by steep grades that increase the cost of hauling at a rate ruinous to the pocketbook.

Talk to the average farmer about this obstacle to his success, and he'll come back with a blast about the cost of road building.

His position is weak—for two reasons.

In the first place, even if he and his neighbors in a township or a county had to spend a considerable sum, no better investment could be made.

Proof: A few years ago Spotsylvania County, Virginia, spent $100,000 on forty miles of road improvement. As a result, within one year outgoing shipments of farm produce increased 140 per cent.

In two years 65,000 tons of export products had been carried an average distance of eight miles at a demonstrated saving of 8 cents per ton mile —a total saving of $41,000 a year to the farmers on what they took to market!

In the second place, in many instances it is not a matter of costly road building, but of comparatively inexpensive correction of the conditions noted above. And in this day of dynamite, which has so notably eased and cheapened the bettering of roads, even the individual farmer, working with his ordinary help, can do much to remove the chief obstacles to market access.

To do this—to take out of the way the worst stumps and boulders and ditch the stretches that most need drainage—would bring about an economic and social revolution that would benefit the average farmer more than anything else that could be suggested.

It would mean reasonably good roads throughout the year.

This, in turn, would mean that the farmer could not only choose his time of marketing, but take advantage of the best market conditions.

It would largely prevent periodic railroad congestion, which frequently is a cause of loss to the man behind the crops.

Money needed for crop movement would be distributed over a longer period of time.

Under present conditions the farmer is the one producer who is compelled to market his goods within a limited period—and that, at times, a period unfavorable to his profits. This places him at the mercy of the middle men. Not infrequently it leaves him with a surplus on which he must take a large loss.

Crops must be speedily moved before poor roads break up in the fall. This not only entails a risk of profitable sale, but brings about a congestion of labor. For a few weeks the farmer and his help must overdo, although for several succeeding months they underdo. Such a division of labor makes for physical unfitness.

Stop, look, and listen to what one of Uncle Sam's hired men—Andrew Anderson, of the Public Roads Office—has to say about the full meaning of better roads. Here is his view, based on nation-wide study:

"We know that good roads are necessary in order that the farmers may take the fullest advantage of modern methods of marketing. They are a powerful factor in promoting better farm conditions throughout the country. They reduce the time and cost of transportation. They make the farmer more independent of seasonal and weather conditions, and permit him to take better advatage of markets and prices. They increase the value of his farm and so enhance his material wealth. They promote better agricultural methods and are necessary for an efficient rural delivery and parcel post.

"They have a profound effect on our country schools and the home life on the farm. Good roads are thus more than a market factor. But, whatever phase of their many-sided benefits we take up, we can never get entirely away from their influence on the point. In fact, good roads are the farmer's best and strongest help for better schools and improved home conditions."

Sometimes I wonder if the farmer fully appreciates the meaning of [illegible] as applied to his important place and his vast power as a regulator of world conditions.

Does he keep in mind the vital fact that commerce BEGINS on his byroad?

Does he remember that the mile or two between his barn or stable yard and the nearest approach to the levelest haul is in reality, the arbiter not only of his own family and financial prosperity, but of wrold advance?

Does he know that the highest tax he pays—and one that daily takes something out of his earnings—is a mud tax, a stump tax, a boulder tax, a no-ditch tax?

If he doesn't, he must. For these are prime considerations in the business of farming. They are prime factors in the conduct of farm life, in the making of comfortable farm homes and the bringing up of healthy, capable, well-inclined children.

The road that leads from his place is his largest asset or his heaviest liability—as he chooses.

It can make or unmake his market.

And his whole system of life and labor is dependent upon this market

Think about this!

HAY DAMAGED BY RAIN

Unfortunately there seems a likelihood that the hay crop this season, though bulky, may be damaged by rain. How serious the deterioration of the quality of hay may be has been shown by investigations and analysis.

Rain-damaged hay is notably deficient in some of the essential constituents, especially in phosphoric acid and lime, while in a lesser degree the alkaminoids are also lacking.

The total loss of dry substanec in the fodder is often quite 25 per cent, and it is not to be wondered at if stock fed on such impoverished material makes poor progress.

The practical moral to be drawn from the investigation is that when feeding stock with hay impoverished by rain, it is advisable to employ more coke and other concentrated feeding stuffs to make up for the nutritive defect of the hay.

When possible, provide for sheep some fresh, sweet pastures which are not infested with parasites.

Trim the loose tags of wool from about the udder and flanks of the ewes, and save the loss of lambs from [illegible] balls in their stomachs.

Cooling Milk in Hot Weather for Cheese Making

The two fundamental factors in producing a high-grade milk are: keeping dirt and bacteria out of the milk, and cooling the milk and keeping it cold. At this season of the year this latter factor becomes of very great importance. The producing of milk under strictly clean conditions is no excuse for not cooling this milk properly; neither is the proper cooling of milk a cure-all for dirty milk.

Effect of Varying Temperatures

In studying the necessity for cooling milk the question arises: How soon after milking should milk be cooled? In order to answer this question we must have some factor or term for measuring the effect upon the milk of holding it various times at various temperatures. In searching about in the various tests put to milk we find that the bacteria count of the milk is our best possible guide, since the number of bacteria in milk is determined by both the time and temperature at which the milk is held. Different experiment stations have done considerable work on this point to emphasize the necessity of cooling milk to a low temperature, and doing it soon after it is drawn.

The following figures taken from B. A. L. Bulletin No. 98 are striking:

Effect of time and temperature on the growth of bacteria in milk.

Temp.	Sample.	No. of bacteria per c. c. 24 hrs.	48 hrs.	96 hrs.
39 F	1	2,400	3,600	218,000
	2	38,000	56,000	4,300,000
46 F	1	3,100	12,000	1,480,000
	2	42,000	360,000	12,200,000
50 F	1	11,600	540,000	
	2	89,000	1,940,000	
55 F	1	18,800	3,400,000	
	2	187,000	38,000,000	
60 F	2	900,000	168,000,000	

Both of the samples were produced under better than ordinary conditions, as can be seen by the count after 24 hours at 39 F.

The following figures from a Storrs, Conn., bulletin show the effect of holding a sample of poor milk at 59 F. for 24 hours:

	Bacteria per c. c.
Milk drawn	153,000
After 1 hour at 59 F	616,000
After 4 hours at 59 F	680,000
After 7 hours at 59 F	1,020,000
After 9 hours at 59 F	2,040,000
After 24 hours at 59 F	85,000,000

By studying these two tables the answer to our two questions can be easily seen; first, milk should be cooled at once after milking—the sooner the better; second, milk should be cooled and held on the farm at least below 50 F., and preferably to 40 F.

Why bother with this cooling? Simply because the milk is a safer and better food product, and if it has not always brought more cash in the past it is bringing more today and will in the future.

The two general methods of disposing of milk are in bulk, in cans and bottles. Some of the same methods of cooling are applicable to both classes of milk, but the cooling of bulk milk will be discussed first. In general there are about five general methods of coolink bulk milk.

1—Setting cans of milk in still-air refrigerator.

2—Setting cans of milk in running water.

3—Settings cans of milk in ice water.

4—By running milk over a cooler.

5—Cooling by mechanical refrigeration.

The first method, namely, that of simply setting the cans of milk in a still-air refrigerator, would be the easiest way to cool milk if it proved to be practical. I say still air because while cold air in circulation will cool faster than still air, there would be no power on the majority of the farms to run a fan even though the milk could be properly cooled by so doing. As a matter of fact, it could not be perfectly cooled even by circulated air. Air takes heat out of cans of milk very slowly, and hence it is a poor cooling medium. To show how inefficient this method of cooling milk is, the writer carried on an experiment cooling a 40-quart can of milk in still air, ice-cooled refrigerator at a temperature 50 degrees F., and in a mechanically refrigerated refrigerator at a temperature of 32 degrees F. Two full cans of milk were placed in each refrigerator. One can in each lot was stirred every 15 minutes. The results appear in the following table:

Table showing time required for cooling stirred and unstirred milk in 40-quart cans in still-air refrigerators at the temperatures of 50 F. and 32 F.

Time.	50° F. Rgtor. Stir'd.	50° F. Rgtor. Not Stir'd.	32° F. Rgtor. Stir'd.	32° F. Rgtor. Not. Stir'd.
	Degrees F.		Degrees F.	
8.00 A.M.	92	92	92	92
8.15	92	..	90.5	..
8.30	90	..	89	..
8.45	89	92	87	90
9.00	87	91.5	85	89
9.15	85	90	83	87
9.30	84	90	81	86
9.45	83	88.5	79	84.5
10.00	81	86	77	84
8.00 A.M. 24 hrs. later	..	58	..	46

A study of the table shows that where warm milk (92 degrees F.) is placed in an ice-cooled refrigerator for two hours the temperature of the milk is lowered to 81 degrees F. when it is stirred with a conical can stirrer every 15 minutes; and to 86 degrees F. when the milk is not stirred. In 24 hours the unstirred milk had been cooled to 58 degrees F. only and had gone slightly sour. In the mechanically cooled room the stirred milk was cooled 4 degrees lower and the unstirred milk 2 degrees lower in 2 hours. In 24 hours the unstirred milk had cooled to 40 degrees F.

From the data we may conclude (1) that stirring milk every 15 minutes during first two hours of cooling results in a temperature 5 degrees to 7 degrees lower; (2) that milk cannot be quickly cooled and cooled to a sufficiently low temperature in either a room having a temperature of 50 degrees F. or 32 degrees F.

Use of Cooling Tank

The practice of cooling bulk milk in cans, setting the cans in a tank of running water, is very common. If one wishes to use this method, or to use ice water, he is confronted with the problem of providing a suitable tank. Wood and concrete make the best materials for cooling tanks, the latter to be preferred because it is more durable and sanitary.

In building a concrete tank a drain should be dug to the bottom of the tank, which should be far enough below the level of the floor in the milk room so that the top of the tank is about a foot above the floor. It is much easier to lift cans of milk in and out of a tank of this kind than a tank that is set on the milk-room floor. The sides of the tank should be reinforced concrete about 4 inches thick, and then, since concrete is a rather good conductor of heat and cold, it should be lined on the inside with two inches of compressed cork. The cork should be covered with metal lath, and a half-inch coat of rich mixture of concrete put on for finish.

The edge of the tank should be covered with angle iron to prevent chipping the concrete when lifting the cans in and out. The cover of the tank may be of wood, and be hinged on the back edge of the tank.

This makes a tank that is not very expensive, and one that will stand for all time.—H. E. Judkins.

SCALY LEGS OF FOWLS

This trouble, which is common in many flocks of fowls, is caused by a very small mite which lives under the scale of the legs. Any oily preparation having some penetrating power will kill the mites. The legs of affected fowls are best prepared for treatment by soaking them freely in warm, soapy water, using a brush to loosen the scales.

Effective remedies are sulphur ointment, kerosene and lard, caraway oil or one part of caraway oil mixed with four parts of lard or four parts of white vaseline. Sulphur ointment may be purchased at drug stores, or one can mix one part by weight of dry sulphur with nine parts of lard.

THE CLOVER CROP.

Editor The Maritime Farmer:

The excellent growth of clover throughout the St. John River valley must suggest to the wide-awake farmer the possibilities of seed production from this highly valued forage plant. To this end the following suggestions may prove opportune:

Where the growth of common Red Clover is very heavy seed production from the first crop cannot be relied upon to be a profitable crop, as the value of the hay is greatly lessened by allowing the crop to mature; moreover, the ripening is very uneven, and with cloudy or damp weather during the early stages of blooming the prospect of a profitable seed yield is small indeed, and such fields would better be cut for hay.

Should the clover field be composed mainly of the mammoth variety of red clover, which is considerably later than the common red, seed may be obtained from the first growth, as very little aftermath is produced from this variety.

This plant may be distinguished from the common red by its taller and usually more open growth, coarse hollow stems often very hairy, large pointed leaves. The plant is later in maturing than the common red and is often favored on this account when sown as a mixture, as it matures with the timothy. The greatest drawback is the woody character of the plant, and, too, the difficulty of procuring seed which is not mixed largely with that of the common red sort.

Where the stand of clover is lighter, or considerably mixed with timothy the prospects of a seed yield from the first crop may warrant allowing the hay crop to mature, as seed in sufficient quantity to pay well for threshing will doubtless be procured. This is certainly true of any reasonably clean stand of alsike clover which the writer has seen this season.

Harvesting the seed crop is best accomplished with the self-rake reaper, though a binder with the twine removed answers equally well. A mower followed by a horse rake is occasionally used, but this method is unsatisfactory. A table attachment for the mowing machine can be had from some manufacturers, which is quite satisfactory when followed by a man with a hand rake who rakes the swath off in bunches.

In any case, the bunches must be frequently turned to attain quick drying, which, too, aids in retaining a good color to the seed. Turning of the bunches should be done while they are still damp with dew to prevent shattering of the seed.

Cutting should not be done until a major portion of the crop is ripe, which condition can be ascertained by the darkening of the flower heads; these when shelled out in the hand will show the stage of maturity.

The farmers of the Ste. Hilare Agricultural Society, Madawaska County, have threshed their clover seed crop during the past two years with a clover-huller machine. The capacity of this machine is rated by the manufacturers to be from eighty to ninety bushels per day. This presumably would be from a heavy seed-yielding aftermath.

The practice in the Ste. Hilare district has been to thresh the hay crop matured with the first growth of clover, which in most instances was made up of a large percentage of timothy, mixed clovers, and rough hay. Such hay has yielded only at the rate of 30 pounds of clover seed to the load (a ton), the straw in these instances being prized as highly as before threshing; but in general the straw from a well-matured stand of clover cannot be considered to be of much value as hay.

Threshing can be accomplished by means of the ordinary threshing mill by closing up a portion of the feed space and also back of the cylinder with strips of board, thus causing the hay to pass through more slowly. However, even this method does not secure but a portion of the seed, and as the wind in this instance must be entirely shut off a great deal of cleaning is afterward necessary.

The clover-huller by one operation threshes and cleans seed of the various clovers, alfalfa, and timothy. An element of uncertainty, however, pervades the growing of clover or alfalfa seed as an industry, inasmuch as weather conditions at the time of flowering largely govern the prospective seed yields. These plans are insect pollenized, and hence should the weather during the early blossoming period of the crop be wet or cloudy the fertilization of blossoms is not to any degree accomplished, and a poor setting of seed results.

It may be deducted that the seed yield from much of the present first crop of common Red Clover throughout Carleton County cannot be expected to prove a profitable venture, as the crop is exceptionally heavy, and such stands are not productive of seed in any great quantity in view of the period of wet weather during the latter days of June. However, where White Dutch or Alsike is now well into bloom, and, too, where Red Clover has not been of so profuse growth, the outlook for securing seed is good. Where the first crop of common red has already been removed there is promise of securing a seed yield from the aftermath.

The all-too-common practice of relying upon the natural seeding of our hay fields with clover is not to be commended with such an unused source of seed supply at hand.

For the benefit of those who may harvest a clover crop for seed production purposes the Provincial Department of Agriculture purposes securing

(Continued on page 713)

Features Gathered From the N. B. Women's Institute Reports

(Continued from May 16th issue)

Codys.—Organized October, 1914. Membership 27, average attendance 15. Meetings held first Tuesday of each month. These meetings are serving as a centre from which many good results are radiating. Not the least of these is the fact that the women of our community have become better acquainted with each other; and unconsciously, as we fulfil the requirement of our institute, we are solving in a large measure the social problem of our community. Interesting and beneficial discussions on "Varnishes," "Canning Fruit and Vegetables," and "Pickling." Splendid papers on "How to Make Our Institute Meetings Interesting and Helpful," "The True Christmas Spirit," and "Our Flag, and What It Stands for." In May splendid demonstration on "Home Nursing" by Miss Imogene Jonah. Generous contributions made to the Belgian Relief Fund. Ten dollars contributed to Ambulance Fund. During the year our members have displayed the greatest interest in the work and aim of the institute, and we hope to maintain this interest, and press on to the development of a love for higher and nobler ideals in life.

Gagetown. — Organized September, 1913. At first our idea was to improve the appearance of the town. The first year street lamps were installed, which were during the past year supplemented by three tubular burners of more improved pattern. The oil was in part donated, and a man hired to keep the lamps in order and to light them each evening. It was rather a problem to get some one to attend to them regularly, and when the war began our thoughts turned to more serious subjects and it was felt the funds should be kept for work of a patriotic nature. If London could go with streets unlighted we felt that Gagetown could do the same! During the winter our meetings were well attended and served as a social bond. A committee was appointed at the close of each meeting to take charge for the following month. In this way variety and interest were given to the meetings. Each evening was devoted to some special topic. One was a Patriotic Evening, with letters from the front, suggestions for Red Cross work, and patriotic poems and songs; another a Housewives' Evening, and still another a Military Evening, in which some time was devoted to learning about military insignia, rank, the formation of the various units, etc. Ten dollars was voted to the Motor Ambulance Fund, and we were glad to feel that we had a share, even though a small one, in this noble work. During the year, through the efforts of the institute, a water tank was installed in the primary department of the school, with individual drinking cups. In October we had a very enthusiastic meeting, the chief topic of which was Soldiers' Comforts. Ten dollars was voted for the Soldiers' Comfort Fund. We are going to devote our energies to working for Soldiers' Comforts, thus supplementing the work of the Red Cross Society, which has a branch here. At our monthly meetings we intend to follow the war, studying it from its various aspects. Altogether we are looking forward to a useful and busy winter for our branch. Before the war, as we considered the institute motto, "For Home and Country," we felt that in working for our homes we were working for our country; now we realize that it is only by working for our country that we can preserve our homes.

Minto.—Organized in July, 1915. Three regular monthly meetings have been held since that time, and the present membership is 18. We have a Sewing Circle in connection, which meets every two weeks at the homes of the members. Receipts of a Box Social and Fancy Sale, $53.78; $15 of which was forwarded to the disablement Fund. We have not as yet reached out along lines of public work, but trust that we may be able to do so later, as we get more established in our work.

Queenstown.—Organized in October, 1914, with a membership of 7, which has since increased to 24. Twelve meetings have been held, with an average attendance of 11. Since organization this institute has been engaged chiefly in patriotic work. One hundred and fifty-six dollars has been raised in various ways and distributed as follows: Red Cross Society, $55; Belgian Relief Fund, $10; Sock and Ambulance Fund, $36; endowing a bed in Dr. McLaren's Hospital, $50; Overseas Tobacco Fund, $5. Besides this, 374 articles, including socks and hospital supplies, have been forwarded to the Red Cross Society, St. John, N. B.

Welsford.—Third annual report from this institute. During the year the meetings were fairly well attended. For the first six months of the year programs were printed, which proved quite a success. Special mention should be given to the June number, which was a "Grandmothers' Meeting." Everything was in keeping with the olden times, even the flowers were the old-fashioned kind, such as "old man." The grandmothers entertained by telling of the customs of long ago.

During the past year the institutes have had one common task before them by this great and terrible war. A great deal of work has been done, making hospital supplies and knitting socks, which have been forwarded through the Red Cross Society at St. John. Four packages of clothing have been sent to the Belgians. Thirty-six dollars and forty-six cents was raised by the sale of buttons for the Motor Ambulance Fund, and $15 of the institute funds were contributed for the same purpose.

Through the influence of the Women's Institute a great improvement has been made in the road around Eagle Rock.

Campbellton.—During the past year the efforts of the Campbellton Women's Institute have been devoted exclusively to patriotic work. The taking up of Red Cross work by the Women's Institute secured the hearty support of the people of Campbellton and vicinity. While the number of members for the past year has only been 24, yet they have been most successful in securing help from other ladies.

Money was raised during the year in the following ways: Three teas, bean guessing contest, sale flag pins, three patriotic concerts, Red Cross dance, May Day sale at Marquis & Co. store, 10 per cent being the share of for the W. I. on all cash sales; flowers, tea, cake, and candy were sold on the same day, and a garden party. Apart from donations received during the year, a collection was taken up for the Hospital Ship Fund, which amounted to $479.85. The total cash receipts for the year amounted to $1 379.46. Following are the objects contributed to:

Hospital Ship Fund	$479.85
Five cots in Le Tonquet Hospital, France	250.00
N. B. W. I. Motor Ambulance	50.00
Upkeep of cots at Le Tonquet	25.00
Mrs. E. A. Smith for 55th Bat. Band instruments	20.00
Campbellton Band	24.18
Campbellton Boy Scouts	5.00
Planting of trees in Campbellton	75.00

Besides these, $377.28 was spent in purchasing materials, from which 1500 articles, including socks and hospital supplies, were shipped to the soldiers.

Dalhousie—Organized in September, 1914, with a membership of 14. Since then the membership has increased to 37. Meetings now held in Church of England Sunday School hall. As this branch was organized shortly after the outbreak of war, patriotic work was immediately taken up. Every Tuesday afternoon and evening we meet for work, while the evening of the second Tuesday of each month is devoted to business.

Last fall we realized $101.55 from a patriotic concert. The proceeds were divided between the Belgian Relief and Red Cross funds. Since then we have raised $632.00 by various means, such as a tag day, a social, the sale of home-made candy, etc. Of that sum $358 was raised by voluntary contributions. Two hospital beds have been provided for, one at Le Tonquet, in France, and one at the Duchess of Connaught's Hospital. Twenty-five dollars was contributed toward the Motor Ambulance Fund, and $75 voted to the Canadian Red Cross Society for the purchase of surgical supplies. The remainder has been used for buying yarn for socks, materials for hospital garments, etc., and comforts for the soldiers in the trenches. When the war is over we hope to take up other lines of work, such as the Women's Institute is regularly engaged in.

Chance Harbor.—Organized in August, 1914, with a membership of 13. In the past year 10 meetings have been held and different subjects taken up, such as "Ways of Entertaining Small Children at Home," "First Aid to the Injured," etc. Books on "Home Nursing," "Home Cooking," "Home Decoration," and others were distributed to the members.

The receipts of a patriotic concert held in June were $28.75, $25.00 of which was contributed to the Motor Ambulance Fund. Two barrels of clothing were collected for the Belgians and $29 was contributed to the Belgian Relief Fund. One dozen hospital shirts were donated by the institute, and yarn ad material for pajamas were received from the Daughters of the Empire.

Lorneville.—Eleven meetings held during past year. Special feature at one meeting being prize for the best worked buttonhole, at another a prize was given for neatest pieced block of quilt. Another special feature was a guessing cake, five cents a guess as to what was in cake, and the same for the weight of the cake. Through the efforts of the Women's Institute the temperance organization has been revived. For patriotic purposes $24.15 was given the Ambulance Fund and $10.00 the Hospital Ship Fund.

Fredericton Junction.—Organized in August, 1914, with a membership of 12. Present membership 23. Average attendance 12. Programmes have been varied, solos, readings, and recitations, with papers on different subjects, such as "Neighborliness," "Canning and Preserving," "Milk," "Flag and Country," "Current Events," "Flies," "Floor Coverings," "Red Cross Work," etc. Circulating library formed in the winter, each member contributing a book. Committee appointed each month to visit the school. Post card shower given to member ill at a distant hospital, and a member ill in Fredericton Hospital was supplied with fresh flowers regularly.

Five dollars was contributed to the Motor Ambulance Fund and $10.25 to the Soldiers' Sock Fund. Ten pounds of yarn bought and now being knit into socks for the soldiers.

Hoyt Station. Seventeen regular meetings held during year, and two special meetings. Present membership 20. Fourteen papers read, written by the members, and one debate held. Money realized during year $187.23. Given toward patriotic objects $92.57, for improvements for school $37.19, for cooking utensils for kitchen in hall $5.73. Members have formed a circulating library. Visits have been exchanged with the Fredericton Junction Institute.

Ripples. Organized July, 1915, with membership of 11, which has since increased to 22, the average attendance being 14. Three regular meetings and one special meeting held. Receipts of Blind Auction $30.25, which was forwarded to the Disablement Fund. Being one of the baby branches, not much work has yet been accomplished, but the outlook is very bright.

Andover.—A good live institute, with most of its members interested and working, is what counts, even if its membership is not large.

Our programmes are arranged by a committee for each meeting. This is not a very strenuous task, as our roll call is already arranged for the year. Each member chooses a subject and gives a contribution on that subject at each meeting throughout the year. The subjects chosen by some of the members are: Immigration, Botany, Missions, Temperance, History, Noted Men, Noted Women, Household Hints, Poetry, Deportment, etc. We believe that this part of the programme will be interesting and helpful to the members in general, but especially helpful to the woman who studies up on one subject for a year.

The needs caused by this fearful war have seemed to come before anything else. We sent $65.00 to the Motor Ambulance Fund in July. In order to raise funds we resorted to the usual methods, ask people to contribute something to eat and then invite them to come and eat it, and pay for the privilege of doing so. We had a strawberry festival, an ice-cream social, etc. It is wonderful the eating and drinking we have done the past year in order that the hungry might be fed and the sick ad wounded provided for, and our community is not unique in this, according to the newspapers.

Of course this is not the only way in which we make sacrifices for the good of the Empire. When the appeal for contributions to the Machine Gun Fund came to our institute we were just then contributing in cash for the same fund, through another medium. But, giving of our abundance, or even when it pinches, can scarcely be called sacrifice. When we give our flesh and blood then we know the true meaning of the word.

We are interested in school work, and voted last year that a committee be appointed to attend the annual school meeting: this was carried out in some of the districts at least. A good representation from our institute attended the meeting when the question of consolidation came up this year. We take our Red Cross knitting to institute meetings, and our fingers keep pace with our tongues.

Our annual meeting in July is the occasion of a picnic to which our husbands are invited. The gentlemen are asked to make after-dinner speeches. They say all the nice things they can think of about us, and we are pleased and happy.

Our institute met with an irreparable loss about two months ago in the death of our honorary member, the late Mr. George E. Baxter. Mr. Baxter was one of our charter members and was seldom absent from a meeting. He was always ready with a word of encouragement, and his helpful suggestions and practical advice have been invaluable to us. He was always much interested in the cause of education and in the cause of temperance, and especially temperance teaching in the schools. Our institute thinks it fitting that in honor of his memory and appreciation of his help we should give a medal yearly to the pupil of the Andover Grammar School showing the highest proficiency in any one or in all subjects, as the institute may decide. For 1916 the medal, to be known as the Baxter Memorial Medal, will be given to the member of the graduating class who shall write the best essay on "The Evils of Intemperance, and How Best to Remedy Them."

Grand Falls.—Membership increased from 20 to 47 in past year. Time principally devoted to work for the soldiers. Money contributed to the following patriotic objects: $215.00 to the Hospital Ship Fund; $50.00 for a bed in Colonel Shillingworth's Hospital; $48 to Motor Ambulance Fund; $45 to Belgian Relief Fund; $25 for hospital supplies; and $30 for Grand Falls Machine Gun Fund. Over 300 pairs of socks and 12 quilts have been forwarded; 1 large box of garments for the Belgians, and a box of comforts to boys at Valcartier. Money has been raised in the following ways: Tag day. $75; patriotic tea and sale, $50; strawberry festival, $30; also by serving lunches at dances and voluntary contributions.

One of the institute members, Miss Irene McCluskey, was heroically rescued from drowning in December last by Mr. George Tuck. The institute obtained from the Canadian Government a Royal Humane Society medal for Mr. Tuck.

Many interesting papers read on subjects such as "The Duty of Members Toward One Another," "Home Nursing," "Civic Improvement," "The Care of a Baby," "Training Young Girls to Become Independent," etc. Pleasant visits interchanged with the New Denmark Institute.

New Denmark.—Organized September, 1914, with a membership of 15, which has since increased to 26. The average attendance is 14. Programs made out for six months. One or two interesting papers read at each meeting, some of the most interesting being "The Great and Good Women of Canada" "Christmas Spirit," "Good Resolutions for the New Year," "Friendship and Sociability," "The Twentieth Century Farmer's Wife," "Our Flag and What It Stands For." A very interesting lecture given by Rev. F. J. Howell on "Education, Its Uses and Value."

The first money collected for patriotic purposes was for the Patriotic Fund, being $184.75. The sum of $14.07 which had been collected to establish a library was used to help equip a hospital bed. Results of picnic, $5.00; proceeds of pie social, $74.30. One of the members donated $4.25, making a total of $97.50 to be spent on hospital bed and Red Cross work. One hundred pairs of socks have also been forwarded to the soldiers.

In June the Grand Falls Institute was entertained, and on Labor Day they more than returned the compliment by inviting the New Denmark Institute to a picnic, which was an unqualified success.

South Tilley.—Organized in September, 1914, with a membership of nine, which has since increased to 19. Principal work is comforts for the soldiers. Sixty pairs of socks have already been forwarded and the good work is still going on. The joint proceeds of a Burns' celebration held in January and a picnic in August amounted to $72, which was divided between the Belgian Relief Fund and Red Cross work. The institute was visited in September by Mrs. Porter and Mrs. Bedell of Andover. Mrs. Porter gave us many useful suggestions in promoting the work of the institute, and Mrs. Bedell gave a very interesting description of her visit to Valcartier. The institutes subscribes to two magazines: The Canadian Home Journal and the Mother's Magazine.

Petitcodiac.—Organized in August, 1914, with 11 members, and has since increased to 43.

Interest in the Belgians first claimed the attention of the institute. Contributions consisting of food, bedding, clothing, and money to the amount of $1,000.00 were sent to the Relief Committee. A prize was given in each department of the school by the institute. During the vacation the members also made picnic teas for the school children after working in their school garden plot. Ten dollars and fifty cents has been given to the Red Cross Society. A number of interesting papers have been read and recipes exchanged. At the February meeting Mr. T. T. Goodwin taught a lesson in parliamentary procedure and business methods. In June Dr. Townsend, of River Glade Sanitorium, gave an illustrated lecture on "Tuberculosis and Its Prevention." Thirty-five dollars has been sent to the Motor Ambulance Fund. The institute is also interested in village improvement work.

Bayfield.—Organized in September, 1912, with membership of 9, which has since increased to 25. Fifteen regular meetings have been held during the year. Four large boxes have been shipped to the suffering Belgians. Red Cross work has been taken up, and four large boxes were shipped to the soldiers. During the summer money was raised by concerts and the sale of ice cream, etc. This money is to be used for material for Red Cross work during the winter. Some interesting papers have been read and a number of books have been purchased and are exchanged among the members each month.

Point De Bute.—Organized in November, 1913. Present membership of 32, with average attendance of 18. Meetings held at the homes of the members. Principal work being Red Cross and Soldiers' Comforts. Programmes made out for the entire year. Tea is also sold at each meeting. The funds raised in this way are spent in material for Red Cross supplies. Over 130 articles, including socks, hospital supplies, and soldiers' comforts, have already been forwarded.

Port Elgin.—This institute has had a busy year. Red Cross work was begun in September, a little more than a month after the outbreak of the war. The first contribution was $60 to the Hospital Ship Fund. In October $7 was contributed to the Belgian Relief Fund, and eight barrels of clothing were forwarded to the Belgian Relief Committee. Two hundred knitted articles have been forwarded to the front and 142 made garments sent to the Red Cross. In November it was decided to work under the auspices of the I. O. D. F., thus taking advantage of the county grant of $200. At the December meeting many easily made Christmas gifts were exhibited and a demonstration given of home-made candy. Also paper on "The True Spirit of Christmas Giving." Forty-two lbs. of turkey were sent to St. John to form part of the Christmas dinner for the soldiers stationed there. The directors of the fancy work and bread classes of the Botsford and Westmorland Agricultural Society were appointed at the February meeting. It was voted to give a special prize for a night dress to be hand sewn and trimmed with hand-made crochet lace. first prize $1.00, second prize 75 cents, third prize 50 cents. Five dollars was voted to the Red Cross for medical supplies. Later a quilting bee was held and two quilts were sent in Red Cross box. Fifty dollars was given to the Ambulance Fund.

Upper Sackville.—Organized in September, 1912. Present membership 36. Motto "If you know a good thing—pass it on!" Important discussions on such subjects as "Should a Wife Understand Her Husband's Business?" "Fireless Cooker," "Montessori Principles," and "Modern Implements of War." "Canada Day" was the occasion of papers on "Resources of Canada," "History of Canada," and Canadian quotations. Programmes typed for six months and passed among the members. Cabinets supplied schools for individual drinking cups, also given by the institute. Two large boxes were sent to the Belgians. Ninety dollars has been raised for patriotic and Red Cross purposes. Five dollars raised by a sale of "Allied for Right" buttons.

Burtt's Corner.—Organized in June, 1915. Present membership 28. Special attention has been given to Red Cross and Soldiers' Comfort work. One box containing 64 articles, including socks and hospital supplies, has already been forwarded. From various sources $64.65 has been raised, of which $19.88 has been used for the purchase of material for Red Cross work. The members have taken splendidly to the institute work and hope to have another box of Red Cross supplies ready for shipment in the near future.

Dumfries.—Organized in October, 1914. Membership 15. Roll call answered during past year with quotations from different authors. Interesting papers on "What Could Women do in Time of War?" "Growing Friendly Flowers," and "What is Bread?" In August a very successful pie social and ice cream sale was held, the sum of $46.50 being realized. After this the members met and cleaned and papered the school house. In September the members of the institute met at the home of their president, Miss Lounsbury, and presented her with an address and a silver bread tray as an appreciation of her services as president. Miss Lounsbury was married on September 29th, but does not leave the neighborhood, so will continue with us in the good work.

Red Cross work was taken up during the winter months and 52 articles, including socks and hospital supplies, were sent to the Daughters of the Empire, Fredericton. Donation was received from a nearby lumber camp of $21.01 for Red Cross work. Five dollars was contributed to the Motor Ambulance Fund.

Fredericton.—In recalling the work of the Fredericton Women's Institute since the convention held in May, 1914, it is difficult to relate what we have accomplished; but, with a paid membership of thirty-one, we have been striving to do our "bit" in improving our homes and the community. By social gatherings from home to home every month we have no doubt influenced one another for good, and thus uplifted to some extent our home life. We have tried to better certain conditions that existed in our city as well.

We had planned to take during the year a course of study on "Women's Work in the World," studying one topic a quarter, under such headings as "Woman in the Home," "Woman in Business," and "Canadian Heroines," but, as with all the institutes and other women's associations, our plans for study and work were suddenly changed and a new and sacred duty given us to perform—work for our dear ones who went forth to fight that we might always have our peaceful Canadian homes. As an institute we have accomplished little in Red Cross work, but many of our members, who belong to different associations, have done their share in the great work. In the year that is before us we must put forth greater effort, for the need is greater.

At one of our meetings held shortly after the last convention a plea was made by a member of the King's Daughters that our institute combine with that and other women's associations in Fredericton in establishing a women's rest room, our branch to have charge of a sewing class for girls. The need for a rest room in this city is great, but the proportion had to be laid aside when Red Cross work became the greater need.

Our institute voiced the question last year of the care and protection of our shade trees. This matter we put before the city council, urging the need of appointing a commission and that the trees along the streets be cared for by the Department of Forestry of the University of New Brunswick.

The Curfew Bell question was taken up soon after our organization in November, 1913, and although "no curfew tolls the knell of parting day," the police have been given orders to see that all children under fourteen years of age, unaccompanied by a guardian, are off the streets at nine o'clock.

Our members have been endeavoring to make it compulsory that bread be securely wrapped in paper before it leaves the bakery. Two St. John firms are delivering bread in this way in this city, the price per loaf being the same as for unwrapped bread, but the weight one and a half pounds instead of two. We hope the day is not far distant when the Provincial Board of Health will take this question up. What is exposed to germs more than a loaf of unwrapped baker's bread?

Another article of food which is very often delivered to the housekeeper uncovered, except with dust, etc., is meat. The members of our institute have agreed whenever meat is delivered to them improperly tied up to return it to the meat shop to be wrapped in paper and securely tied.

We have resolved if we neglect to send in orders in plenty of time for their delivery before evening, to go down town and carry our purchases home ourselves. We are trying to persuade our friends as well to get their orders in early in the day, so that the delivery teams will not have to be out until the "wee sma'" hours.

Not until lately have the country women coming into the market had a suitable rest room or a place to warm themselves in winter. Our institute took up with the chairman of the market committee of the city council the question of equipping a room for this purpose in the basement of the City Hall. We are glad to say that the council has had the place renovated and employ a woman to keep it clean, and we have placed stationery and magazines in the room. This is much appreciated by the women coming to market, especially after a long and sometimes very cold drive.

The secretary of the Fredericton Exhibition Association left the placing of women's exhibits, caring for the exhibits, and the appointment of judges for women's work this year in the hands of our institute. The entries were numbered instead of being inscribed with the exhibitor's name, so in this way no partiality was shown. Two competent Domestic Science teachers and one efficient housekeeper were appointed as judges. Twenty-two dollars in prizes were offered by the Fredericton Women's Institute to the women of this city for different lines of cookery, and the competition was a very interesting one, several of our members being among the prize winners.

As an institute, we exhibited cookery in the departmental competition, and although we did not take a prize the five-dollar prize offered by the Department of Agriculture for the best home-made labor-saving device was won by one of our members. We hope that in future work of this kind will be encouraged by the department

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; inches—First insertion $2.25.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or
R. D. Robinson Publishing Co., Limited
Sussex, N. B.

Toronto Representative—J. Lester Davis, Miln Building 8 Johnson Street.

Montreal Representative—Dakers Cameron, St. Nicholas Building.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

December	5—19

PSYCHOLOGY OF FAIRS

The Maritime Farmer considers an effort to improve the standard of our county fairs a very necessary adjunct to increasing the usefulness of all agencies for promoting agriculture and agricultural practices. This, however, is much easier said than done. We consider it a real problem.

It is important to consider the incentive and frame of mind of the average farmer or citizen who attends our county fairs. We fear, through habit developed over a series of years, that the average person visits the county fairs as a pleasure seeker. It is supposed to be, in a great many sections, the principal frolic of the season. The average person is curious to see what is on display in the several departments, but in most cases his desire is satisfied by wondering just how such things are produced rather than to go into details as to how such a result was accomplished. He is at the fair for pleasure; he wants to see it all in one day, and therefore does not desire to go into detail about anything of a serious nature.

There are of course many exceptions, especially among exhibitors in any particular industry. These persons like to watch the judges, to see in what respect their exhibit loses out. It is a question here if the money end of the proposition (prizes) is not the propelling force rather than what can be learned to put in general practice on the farm. From our observation, the average person will thus glance over the exhibits at the county fair in about two hours, remaining at any one place only a short time for fear he will not get over all by the time the races or other special attractions begin.

It must be further remembered that the county fair is the great attraction of the year to many farmer boys and girls. The parents must accompany the children and this is an added reason for the family, as it were, to be continually on the move at the fair. If this depicts the general frame of mind of the average visitor to the county fair, then the problem of the county fair is to first meet the demand of the people in amusement; second, to come out financially on the right side of the ledger; third, to be an inspiration to its constituents and serve as a real educational factor in the county.

LOAFING LIVE STOCK

Under the above caption the following editorial appeared in a recent issue of "The Breeders' Gazette." Ponder it well:

"A young farmer accounted for his small income balance last year by explaining that his cattle and hogs gave meager returns. His bull proved impotent, so that he raised only 3 calves from a dozen cows. His sows farrowed weak pigs and lost most of them, but he kept them on through the summer to try again. The consequence was that a lot of good grass, hay, and corn went down the throats of unproductive animals. His loafing animals ate nearly as much as any in the neighborhood, and paid back but little for their board. With fairly accurate accounts he and two neighbors figured their year's balances. All had farms of the same acreage and all had about the same range of experience. His net returns were just about the same; the difference was cut entirely from the profits.

"There is no room on $250 land for idle stock. Grown animals must pay their way by working in the field or by breeding, and young stock must grow and become constantly more valuable. Loafing stock costs more than the owner usually suspects. Much of this failure shows plainest when the spring crop of calves, pigs, or lambs is counted. One farm will show 100 pigs from perhaps 15 sows, while another has 20 sows to raise about the same number of offspring. In one pasture one finds possibly 8 cows, each of which is raising a salf, and in another there may be a dozen cows but only 8 calves in the barn lot. Frequently the contrast is greater. The shy, barren, or unmotherly females, or the impotent males, that may be to blame are undesirables of the most unprofitable kind. Production must be a prime consideration. The females which annually show up a big count of young at weaning time will pay their way eve if some discount must be made on the score of quality. The best thing about it is that both numbers and quality can be secured together. One of the successful neighbors mentioned raised 5 excellent pure-bred calves from 5 cows."

DAYLIGHT IN FARM BUILDINGS

One of the commonest mistakes made in planning Canadian farm buildings is the small number of windows in the stables. In the placing of the buildings, in their relation to one another or to other surroundings, care may have been taken, but in so many instances there has been an utter disregard of the proper lighting of the stables. Many fine barns and stables, well painted, and of excellent outward appearance, are miserably lighted and are dark and gloomy within.

Prevention is better than cure, and light is the cheapest preventive measure known against disease. Dark and dingy stables are much more [illegible] of comfort and health, which means, incidentally greater profits, let us have more light in our farm buildings.

DON'T TORMENT--DON'T WASTE ADVERTISING MONEY

Two conditions, equally aggravating, always crop up at this time of year. Breeders of pure-breds advertise more extensively at this season and during the fall, and they pay good money for the service the agricultural journals render—at least, most of them do in time. They want to reach prospective buyers of their breed, and most of them cannot afford to carry on active breed propaganda work to any extent.

There are always a number of people who answer these advertisements from no other imaginable reason than curiosity, or to show the postmaster that he isn't the only man in the community who has mail come to his house. If you have any intention of buying stock, or any other commodity, by all means get comparative prices from various breeders, and mention the paper you saw the advertisement in; but don't make a nuisance of yourself by inquiring if you have no intention of buying.

On the other hand, some breeders are altogether too lax about answering inquiries. When some breeders run low, or if an inquiry reaches them from some point they cannot conveniently ship to, or if the letter does not appeal to them, they absolutely disregard it, and the inquirer is left in the dark. Failure to reply to inquiries wastes money, handicaps future business, and exhibits a lack of courtesy. Even though there are some inquirers who write from sheer curiosity, most of them have some idea of buying. Treat them with courtesy, anyway. It is coming to the inquirer, to the breed you represent, and to yourself.

Friendly rivalry between breeders of different kinds of stock forms an excellent incentive to raise the standards of animal husbandry, but it should not go farther than the friendly rivalry. The fact that one cow holds a record does not prove that her breed is best, but it does prove that she is an excellent individual, and excellent individuals may be developed from a number of breeds. Don't try to pick out the best breeds. Pick out the breed you like the best, and then spend all your time, study, and effort in developing the best possible individuals from your herd.

One of the best ways of doing this is to buy a pure-bred sire. You cannot get one that is too good. He will increase the production of your herd rapidly and cheaply, no matter what his cost. For the man who does not feel that he can afford to buy a herd of pure-bred cows, this is the best and most effective procedure.

A wagon road is no better than the worst hole in it, and the repair and grading up of our roads would not only add vastly to the size of the load we could haul over most of them, but much of the wear and tear of wagons and machinery and sacrifice of horses would be eliminated.

Don't allow the prospects of a heavy fruit crop to tempt you into leaving more fruit on the trees than they can properly sustain. By thinning it out the quantity will be greater and the quality much better than where it is crowded, and the danger from insects is also diminished.

HORTICULTURE.

BORDEAUX AND THE BLUESTONE QUESTION

G. C. Starcher, Associate Horticulturist, Virginia Polytechnic Institute

"Should I use the 4-5-50 Bordeaux formula and arsenate of lead when bluestone costs 30 cents per pound, or should I substituto some prepared spray material?" is a question many fruit growers are now asking. As an answer, let us compare the above formula with two Bordeaux and arsenate of lead paste substitu
largely sold in Virginia. Bordeaux made according to the Virginia formula contains:

Bluestone, 4 lbs., at 30 cents	$1.20
Stone lime, 5 lbs., when slacked 6.6 lbs., at ½ cent	.03
Powdered arsenate of lead, 1 lb., equal to 2 lbs. paste lead, at 17 cents	.17
Total dry materials 11.6 lbs, cost	$1.40

Don't Use Guesswork

It is wrong to use guesswork in discussing a problem like this, but since our fruit growers are guessing in a haphazard way let us guess intelligently. Since the substitutes mentioned below are in the form of paste, let us, for the sake of comparison, assume that they contain 20 per cent water. Adding 20 per cent water to 11.6 pounds dry materials in formula above, we have 13.9 pounds paste to each barrel, at a cost of $1.40 per barrel, or almost exactly 10 cents per pound. And this is a material about which there is no question of doubt. No substitute, pound for pound, can be better. Substitute No. 1 costs 20 cents per pound in small lots and as low as 14 cents in larger quantities. Substitute No. 2 costs the same price, but eight pounds are supposed to be used to each fifty gallons of solution instead of five pounds in the recommendations for No. 1.

Certain paste Bordeaux preparations contain as much as 62 per cent total moisture, a part of which is chemical moisture.

In other words, Bordeaux properly made with bluestone at 44 cents per pound is as cheap and more safe to use than substitute paste material now being sold. You know what you are using when you make your own Bordeaux. And this is not meant as a condemnation of the prepared materials. Some have good records. Many are new. They are convenient to use, but all must be carefully agitated while being sprayed.

A paste material containing the amount of bluestone lime and arsenate of lead recommended in Virginia for the June spray for bitter rot and second brood of codling moth to make 50 gallons solution must weigh at least 14 pounds. It is unwise and unfair to compare Bordeaux with other materials on any other basis.

How to Make Bordeaux

Bordeaux is made as follows: Dissolve the bluestone by suspending the desired number of pounds in a sack at the top of a wooden or earthen vessel containing an equal number of gallons of water. Slake the desired number of pounds of stone lime and dilute to an equal number of gallons of water. These are stock solutions and each gallon contains one pound of the respective chemicals. When ready to mix to the desired number of gallons of each of the stock solutions, add four gallons water, then pour these diluted solutions into the spray tank at the same time. Add the arsenate of lead in a sufficient amount of water to fill the tank, or enough water alone if no lead is to be used. Bordeaux is the standard spray for bitter rot and blotch of apple, potato and tomato blight, and various diseases of the grape, melons, and other vines. Do not use on peach, cherry, or plum. The formula is varied to suit special conditions.

WHY PYROX IS BETTER THAN BORDEAUX

O. B. Briggs, Local Manager, Bowker Insecticide Co.

It is undoubtedly Prof. Starcher's desire, as it is ours, that the Virginia fruit grower get the greatest possible value for his money when he buys his spray material. This at least is common ground, and if we have to differ with Prof. Starcher's conclusions it is because we interpret differently the figures that he has used in regard to the cost of home-made Bordeaux and arsenate of lead mixture as compared with the cost of Pyrox.

Prof. Starcher's conclusions seem to be based on the following statements that he makes: "A paste material containing the amount of bluestone, lime, and arsenate of lead recommended in Virginia for the June spray for bitter rot ad second brood of codling moth to make fifty gallons solution must weigh at least fourteen pounds. It is unwise and unfair to compare Bordeaux with other materials on any other basis." He also says: "No substitute, pound for pound, can be better."

Comparison of Strength

We do not know how Prof. Starcher has arrived at these conclusions, and we cannot see how they are based on facts. We will accept his own statement that it requires fourteen pounds of his home-made bordeaux and arsenate of lead mixture made according to the formula used in Virginia to make fifty gallons of solution. A solution of Pyrox made fourteen pounds to fifty gallons of water would surely be excessively strong, as can be testified to by any Virginia orchardist who has sprayed with Pyrox. With a high pressure barrel pump or power spray, we recommend using Pyrox one pound to seven or eight gallons of water, depending on the pressure. This is only six ad a quarter to seven pounds to fifty gallons of water. If this dilution had not proved strong enough for the control of bitter rot and the secnod brood of codling moth we would surely have heard of it long ago.

On the other hand, Pyrox used at this strength, and even at a weaker dilution under favorable conditions as regards the pressure and the fineness of the spray, has proved thoroughly effective. It is therefore very clearly evidet that the statement on which Prof. Starcher bases his conclusions is not based on facts. In short, hundreds of Virginia orchardists are using six to eight pounds of Pyrox to do the work for which he recommends fourteen pounds of his home-made Bordeaux and arsenate of lead mixture, and the results from the use of Pyrox at this rate have been uniformly satisfactory and we could even say that the results have been more satisfactory than from the use of Bordeaux.

Cost of Spray Chemicals

Prof. Starcher has shown that the material cost for his mixture for making fifty gallons of spray solution is $1.40. At the rate of one pound to eight gallons of water, or 6¼ pounds to fifty gallons of water, and at 12 2-3 cents per pound, which is the cost of Pyrox in the 300-pound barrels, the total cost of Pyrox for fifty gallons of spray is 79 cents. Or 6¼ pounds at 13½ cents, which is the cost in 100-pound kegs, would equal 84 cents per fifty gallons of spray solution. Now, the Pyrox spray is ready to use and simply requires to be mixed up with water, which every orchardist will admit means a considerable saving in time and labor. The cost of $1.40 per fifty gallons of spray, which Prof. Starcher has figured for the Bordeaux and arsenate of lead mixture, does not include the cost of the time and labor for making this material. It will therefore be very obvious that the difference of 56 cents to 61 cents per fifty gallons of spray in favor of Pyrox, as shown above, does not represent the entire difference, for the labor of making the spray is a considerable item.

Our conclusion would be that, even if a grower were able to make a satisfactory Bordeaux, and liked it, he would not be willing to pay 56 cents to 61 cents per fifty gallons of spray for the privilege of making his own Bordeaux. Nor does this tell the whole story.

Use Finest Spray Nozzle

Not only is Pyrox stronger, pound for pound, and as shown above it would appear to be twice as strong as the home-made Bordeaux and arsenate of lead mixture, but gallon for gallon of spray solution, it is a superior fungicide for the control of bitter rot and other serious fungous diseases, and it is more economical to use, even if Pyrox cost more per gallon of spray solution. This is due both to its superior fungicidal value and to its mechanical condition. It isn't how much spray you use, but how the spray is put on. A bushel of sand spread out on your barn floor will cover a larger area more thoroughly than a bushel of gravel. The same principle holds in applying a spray material, and a spray that is smooth and fine, so that it will go through the finest spray nozzle and be applied in a fog-like mist, will envelop every part and give more thorough protection with a less amount of material.

We believe that the common practice in spraying with Bordeaux is to use a spray nozzle with a hole in the disc measuring 5-64 of an inch. With Pyrox it is possible to use a disc with a hole half this size and we recommend always with good pressure the use of the disc the whole in which measures 5-128 of an inch. According to the Arkansas Experiment Station Bulletin No. 114, this means that while with the larger opening 3¾ quarts per minute would be applied at 150 pounds pressure, with the smaller opening which we recommend for Pyrox 1½ quarts per minute would be applied under the same pressure. The result is that the Pyrox solution applied under these conditions would go more than twice as far as the Bordeaux and arsenate of lead soltuion applied with the disc which it is necessary to use, because it will not go through the finer nozzle without clogging. The example of the bushel of sand and the bushel of gravel will show you why this smaller quantity of Pyrox will cover the surface more thoroughly than the larger quantity of Bordeaux which, because of its being more or less coarse and uneven in its mechanical condition, must be applied with a coarser nozzle and in a coarser spray.

Bordeaux is Guesswork

We have ever disputed the fact that Bordeaux properly made is a good fungicide and for this purpose is vastly superior to lime sulphur. The fact remains, however, that no matter how careful or intelligent the farmer may be, the making of Bordeaux is guesswork, for the farmer has no way of determining the purity or chemical composition of the chemicals that he buys to make Bordeaux. On the other hand, the most vital factor in the making of Pyrox is our chemical laboratory, where tests are being constantly made by expert chemists so that the result is a uniform and high-grade product chemically combined to get the greatest possible effectiveness.

Sticking Quality

Another factor which Prof. Starcher has not mentioned, but which has a great bearing on the result, is the sticking quality. It needs no proof to show that a material which will stick on in spite of rains will be more lasting in its effect.

In conclusion, we wish to say that we have never experienced any great difficulty in selling Pyrox under the old conditions with bluestone at its former low price, and with bluestone at 30 cents per pound it is impossible to figure in any practical way to show that fifty gallons of spray solution of home-made Bordeaux-arsenate of lead mixture will cost less than fitfy gallons of spray solution with Pyrox. In fact, our figures above and the figures showing the cost of the material given by Prof. Starcher will show that with bluestone at 30 cents per pound Pyrox cost 21 cents per pound and still be as cheap per tank of spray as the Bordeaux-lead mixture. This is saying nothing of the superior value of Pyrox as a fungicide, of the fact that it will go farther and do more thorough work, or of the fact that it will stick on in spite of rains and give more lasting protection.

ADHESO AND WHY IT IS SUPERIOR

Ralph R. Adams, General Manager, Ansbacher Insecticide Co.

A manufacturer must make a spray material far better than it is possible for a grower to make it himself, or that manufacturer will go out of business. It may be possible to fool a grower once, but not twice, for he can tell the value of a material by the results he gets, and there are not enough growers i nthe country to keep a manufacturer in business if he can only sell each grower once.

When you see the sale of a brand of spray material falling off, you know it is not giving the proper results, that the growers have tried it and found it wanting. Again, when you see another brand being used by more and more growers each year you know it must be a good material.

The final vote as to its value is with the growers of the country. With them lies success or failure for the manufacturer.

Home-made Spray Unsafe

Have you ever dug up old bulletins in regard to making home-made spray chemicals and found directions for making arsenate of lead? If you are one of the unfortunates who have made some under those directions, you saw your crop burn, wither, and die.

Since then you have been able to buy arsenate of lead that gave the good results you had hoped to, but did not, get by the so-called economy of making a home-made preparation. You then realized that it was possible for a manufacturer to produce a material far superior to anything you could make yourself from any formula given you.

The same situation has for many years confronted the grower in regard to home-made Bordeaux and arsenate of lead combined as compared with Adheso.

It is human nature that when a man makes up his own spray chemicals, and the result is burning or russeting, that he keeps it to himself, for no one goes around advertising his own mistake. But let him buy a commercial spray material and get what he does not consider the best results, and you can hear from Richmond to San Francisco.

Bordeaux Burns and Russets

In the years I have been engaged in the spray chemical business, and before that in orchard practice, I have never found an orchardist who did not at one time or another have trouble with home-made Bordeaux. One mixture would cause no damage, and another would result in burning or russeting.

It is because of these frequent bad results and consequent damage to the crop that lime sulphur came into use as a summer spray, although it is stated by the United States Department of Agriculture that Bordeaux should be used to control apple blotch

(Continued on page 714)

A Sluggish Liver

CAUSES LOTS OF TROUBLE.

Unless the liver is working properly you may look forward to a great many troubles arising, such as constipation, severe headaches, bilious headaches, sick headaches, jaundice, sick stomach, etc.

Mrs. J. Shellsworth, 227 Albemarle St., Halifax, N.S., writes: "I take pleasure in writing you concerning the great value I have received by using your Milburn's Laxa-Liver Pills for a sluggish liver. When my liver got bad I would have severe headaches, but after using a couple of vials of your pills I have not been bothered with the headaches any more."

Milburn's Laxa-Liver Pills are, without a doubt, the best liver regulator on the market to-day. Twenty-five years of a reputation should surely prove this.

Milburn's Laxa-Liver Pills are 25 cents per vial, 5 vials for $1.00; for sale at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

A New Shoe Idea for summer outdoor work

Write for Catalogue

For Farmers, Woodmen, Millmen, Trackmen, Laborers—all who work outdoors.

Palmer's "Moose Head" Brand

Summer Packs

Made of our famous Oil-Tanned Skowhegan waterproof leather; they have waterproof sole-leather outsoles and solid insoles. The soles, too, are attached by an improved clincher fastener process. They are staunch, light-weight working shoes for spring, summer and fall. Your dealer will likely have them; if not, write us, giving his name and address.

Advertise in The Maritime Farmer.

NEW CHEAP INSECTICIDE

The potato bug is now so well distributed throughout the Maritime Provinces that every farmer is naturally interested in any improved method by which this pest may be killed.

Mr J. A. Neilson, of the Horticultural Department of the Manitoba Agricultural College, has carried on some very successful experiments this year with a new and cheap insecticide, the special value of which is partly derived from the fact that paris green is this year selling at about three or four times its ordinary price. The new preparation will also stick to the foliage better than does the paris green.

The name of the new preparation is Calcium Arsenate. The formula is as follows: Sodium Arsenate (dry powdered), 10 pounds; fresh stone lime, 6 pounds; water, 2 gallons.

Heat the water. In about 1½ gallons of it dissolve the sodium arsenate. With the other half gallon begin the slaking of the lime, which has been previously broken into small lumps with a hammer. When slaking is well under way pour in the dissolved sodium arsenate. Stir until all slaking has ceased, adding even more than the original amount of water if this should be necessary to prevent the lime from burning. The result is a thick paste. Of this paste 4 pounds is enough to add to a 40-gallon barrel of water, this being the right strength for spraying.

When the spraying is to be done the paste should be liquified in hot water; pour through a cloth strainer to take out any lumps that might clog the sprayer, and water down to the right strength, as indicated above.

As with paris green or any other arsenical poison, the mixture should be agitated as it is used so as to prevent settling.

Unlike paris green, calcium arsenate will not burn the foliage, neither will it wash off as easily as the paris green. It is cheaper also than arsenate of lead, which has been considerably favored during later years because of its non-burning characteristics. Purchased this year in 10-pound lots, the sodium arsenate costs about 17 cents per pound. On the basis of these figures, the spray costs 25 cents per barrel, which amount should cover two-thirds of an acre.

SUMMER PRUNING OF THE APPLE

Whether it is best to do anything extensive in the way of pruning apple trees in the summer is a question regarding which a great deal has been said and written. Both sides have been well represented. But so far as I have heard or seen, the majority who have expressed an opinion are not in favor of the practice.

While there are strong objections to the doing of a great deal of this kind of work when the trees are in full leaf, it seems to me that on a restricted scale summer pruning may be quite useful. Just how much to do must be determined by the condition of the trees. If pruning is needed to improve the form of the tops, it would better be deferred until late in the fall or early next spring. The only exception to this rule is where branches have been allowed to grow across, or to come in contact with each other. If the growth of wood has been excessive a part of it should be removed. And if the tops are dense it will be wise to thin them sufficiently to allow a pretty free circulation of air and to admit enough sunlight to properly color the fruit. All dead limbs and those which are seriously diseased should be removed without delay.

Where branches are taken off the cutting should be done close to the trunk, or to the larger limb to which the one to be removed is joined. This is important, because spurs, even if they are short, are liable to decay and cause serious injury to the tree. The cut should be as smooth as it can be made. As the bark is soft at this time of the year, care should be taken not to bruise it or separate it from the wood. If large branches are taken off it may be well to cover the wound on the tree with paint. Whether it will pay to do this where only small branches are removed is an open question. In practice, at least, successful fruit growers are not agreed. Judging from the results of my own experience, it is a matter of very little importance.

On small apple trees no extensive pruning should be done in the summer, or, in fact, at any other season. With the exception of rubbing off superfluous buds, all the work that such trees need in this line can be done with pruning shears and a sharp knife. But though only a little is required, this work should not be neglected. Neither should its purpose be overlooked. This is simply to prevent growth that would be worse than useless to the tree.—J. E. R.

Send for new "Money Saver" Booklet

Barrett Money Savers for Farmers

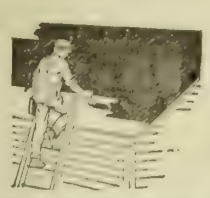
Made in Canada

BARRETT Money Savers will solve many of your problems, and save your time and money. Good dealers almost everywhere carry them in stock.

EVERLASTIC ROOFING

EVERLASTIC is a splendid "rubber roofing". It is just what you need. Tough, durable, weather-proof and inexpensive. No better "rubber roofing" could be made at the price. Very easily laid. It will solve your roofing troubles. Made in one, two and three ply weights. Be sure to ask for it the next time you go to your dealer's.

EVERJET ELASTIC PAINT



THEN there is Everjet Elastic Paint—the best carbon paint ever made. Everjet has saved many a dollar by keeping "ready roofings" in first class condition. It is elastic and expands or contracts to meet temperature changes. It never peels, scales or cracks. And as a roof paint Everjet stands alone. It has great covering capacity—therefore, it is not expensive to use. Absolutely waterproof—therefore, protects against leaks and weather. You should never be without Everjet.

AMATITE ROOFING

AMATITE Roofing is distinctive for two reasons—its bright, attractive, sparkling appearance and its great durability. It has wide fame, too, as the roofing that needs no paint. Its mineral surface is waterproof and fire-resisting. Amatite is made in rolls, each roll containing enough to cover 100 square feet with a 3 inch lap.

CARBONOL

THE most necessary thing you could have around the house is a bottle of Carbonol. It is the best disinfectant, healer and cleanser ever made. Removes grease, germs and odors. Therefore, put some in the water with which you clean house. Heals cuts and wounds; prevents blood poisoning. Wonderful in the sick room because it prevents contagion. It will keep your stable or hen house clean and drive flies away from garbage pails or cattle pens. The best thing you could have for a hundred different uses. Get a bottle today.

CREONOID, LICE DESTROYER AND COW SPRAY

CREONOID is the most effective lice destroyer and cow spray ever made. Spray your live stock with Creonoid and they will be happy and healthy. Creonoid makes care-free horses — cows that give a generous yield of milk — and clean, good-laying hens. A little Creonoid sprayed in the piggery helps make profitable porkers. Follow directions carefully.

GRADE-ONE CREOSOTE OIL

Barrett's Grade One Liquid Creosote Oil

NOW those fence posts of yours would not have rotted if you had used Grade-One Creosote Oil. It has been proved that this wonderful wood preservative will keep fence posts and timbers rot-proof for twenty years. Don't think of putting wood into the ground without treating it with Grade-One Creosote Oil. It penetrates farther into the wood than any other preservative. It also lasts longer. And it is so easily applied. Use it wherever wood is exposed to dampness, earth or weather. It saves you money.

ELASTIGUM WATERPROOF CEMENT

MANY a leak in your purse is caused by neglecting the little everyday repairs or else by paying too much to make them. Play safe. Have Elastigum — the wonderful, waterproof cement. It makes those little necessary repairs easy and cheap. And they are permanent too. It's just what you want for joining and relining gutters of metal or wood. It seals leaks and joints. The best thing you can use for chimney flashings. Elastigum is waterproof so that any joint sealed with it stays sealed.

Send for illustrated booklet describing Barrett Money Savers in detail. Address nearest office.

LIVE STOCK.

CALF REARING WITH MILK AND SUBSTITUTES

To make calf rearing for beef purposes pay for the milk at the rate it brings in the sweet-milk trade, butter making, or cheese factory, several calves must be reared per annum by each cow. There are many ways to this end, and endless variations of practice to suit situations and abundance or scarcity of labor.

The nearest approach to nature's original device is to put two calves to suck simultaneously from a cow for three or four months, and when these calves are started eating some ground oats mixed with a little linseed meal they may be weaned off the cow and continued in growth by hand feeding, always bearing in mind that they have access to good clean water. Another pair of young calves can be put to suck as their predecessors had done. Weaning such calves at three months, five calves can be reared each year by any good milking cow. One calf will suffice for the cow finishing up her lactation. The writer successfully reared ten calves in one season with two cows that were hard to milk. The period which required the closest attention was the weaning of the calves from the cow, but the sympathies of the children about the farm ought to be enlisted in this work and a very useful course in agricultural education will be achieved. Train the calves to eat from the hand the crushed grain, or chop and feed them with a substitute for milk from a pail of a mixture to be referred to later. There is difficulty sometimes experienced in getting the cows to take the second or third batch of calves. No set plan can be detailed to induce every cow to accept strange calves, but persistence, directed by brains, always will succeed. The future progress of these calves depends greatly on careful attention and good feeding to keep the baby beef on. They must not be neglected and allowed to shrink back.

Calves can be successfully reared on various substitutes for milk, but for the first month of their lives it is courting disaster to have much substitute of any sort. It is especially important for the calf that it get the first or colostrum milk of the dam. The milk is a powerful laxative, and is effective in removing the fecal matter from the alimentary canal, and in addition serves as a tonic. Some approve the taking away of the calf immediately it is dropped, but always give it the dam's milk. This more easily reconciles the cow and teaches the calf more readily to drink. If the calf is at all weakly it will be found advisable to let it suck for a few days, up to the ninth milking, when the cow's milk will be fit for use. This will also ease the cow's udder, if there is a tendency to inflammation, better than can be done by hand.

After the calf is a month old more liberty of ration is permissible, and much cheaper articles can be given safely in place of a portion of the natural milk diet. The secret of success lies in gradually working in the substitute in place of the good milk and inducing the calves to take up the new ration.

Linseed meal—not oil cake meal that has the greater percentage of oil extracted—should be scalded with boiling water and allowed to cool and turn to a jelly, will be found a good first substitute along with milk; about half a pound per day—that half pound dry meal made into jelly.

Where no skim or separated milk is available for the older calves a substitute or equivalent is found in mixtures of oleaginous meals cooked in hot water. Manufacturers have devoted much care and study to the invention of suitable substitutes, and while none of

Clean to handle. Sold by all Druggists, Grocers and General Stores.

these is equal to good milk wonderfully successful results can be obtained if carefully handled. Cod liver oil is the best substitute known to the writer, and calves have been successfully reared on that almost alone as an extra to milk; about 2 to 3 ounces to the gallon of separated milk is the quantity to start with. The price of cod liver oil today may preclude its profitable use.

A good calf meal can be made at home by mixing together two parts by weight of finely ground oatmeal, two parts cornmeal, and one part pure ground linseed meal. Practically as good results have been attained with this mixture as with any other substitutes or equivalents. A cream substitute should be pure, rich in fat, and readily digestible; and cod liver oil is the nearest approach to what is wanted. But a milk substitute needs a wider basis, and the above mixture of finely ground oatmeal, cornmeal, and flaxseed meal is as good as has been got.

It is always a point of difficulty to beginners to know what quantity of meal to dissolve in making the gruel. After some experience the individual progress of the calf will show if it requires less or more, and this knowledge can scarcely be taught by pen. But it may be some guide to repeat: Whole milk, sweet and warm, for the first month of calfhood, from 4 quarts at birth to 6 quarts per day at one month old; substitutes slowly and gradually take place as time flies. Quantity of meal to make into gruel, about one pint, or about half a pound by weight, for each calf per day, made finally into 6 quarts of warm gruel. At first the meal should be gently boiled or steeped in boiling water and left for six or eight hours to jelly, then reduced to thin gruel with warm water. During the transition period, when milk is in use, the quantity of gruel will not of course be 6 quarts. That is the daily allowance of milk or milk and substitute, or substitute. Even at three months two gallons per day, fed twice, is ample, and need not be increased. After the calf is from 3 to 4 months old a dry meal feed, starting with half a pound a day to two pounds when a year old. There are many cakes specially made for calves which are successfully used, but cotton cake nor cotton seed meal should not on any account be given to calves. Much harm has been done to calves by this meal or cake, which is valuable enough for older stock. Plenty of sunlight and ample ventilation are necessary. Calves can stand quite a bit of exposure to cold if well fed.—Ottawa Valley Journal.

GIVE PURE AIR

Some people are inclined to think a hog can get along anywhere and anyhow, and often no thought is taken for his comfort. A hog has no more sentiment than a hen, but he will thrive and grow, or suffer and squeal according to the way he is treated. Draughts are prime promoters of colds which develop into pneumonia and what is known as swine fever. Too many persons who attempt to raise hogs pay no attention to the ventilation, or if they attempt to ventilate or all they do little more than leave a few boards off around the bottom, through which the cold air comes, but they provide no way for it to get out.

It is important that the bottom boards should be tight, as also between the pens. Ample ventilation should be provided from above and not by underneath draughts. Who has not seen hogs piled upon each other in cold weather, shivering and fighting to get into a warm place? Under these conditions it is impossible for a hog to put on flesh, and there are nine chances in ten that he will take cold, which may develop into serious lung trouble. Pig house floors must be kept dry, whether of cement or plank. Clean, dry bedding is always appreciated by hogs in the fall or in winter. Their natural instincts are for cozy quarters which may be accepted as suitable for them. After you begin the fattening process it is wise to feed all they will eat with a relish. As a rule, the shorter the period of fattening the larger the profits, and the meat is better flavored for home use. With animals that will multiply as rapidly as pigs, it is a shame that men will waste their time, money, etc., on scrub hogs with no trace of ancestry or hope of posterity. Yet this is what a large number of farmers are doing, and still they wonder why feeding hogs is not paying them substantial profits. It is not wise

LYE

to sell good, mature brood sows and replace them with young ones, as it will produce a weak strain. In selecting a brood sow watch them at feeding time. The thriftiest and fattest always get to the trough first, and these are the ones to buy.—N. E. Homestead.

WHEN HOGS SHOULD BE RUNG

The ringing of hogs is a much more common practice in older countries than it is in the Maritime Provinces. Here we have an abundance of range for hogs and the rooting up of a pasture is not considered serious. As our present extensive methods are gradually replaced by more intensive methods we will find that a good crop of alfalfa or other good pasture is too valuable to be torn up by the snouts of hogs. The little copper wire staple so commonly used in the east and south is the best preventive against the rooting habit in hogs.

A hog on pasture should certainly have rings in his nose, especially if a number of hogs are kept on a limited area. One case where it is decidedly necessary is on alfalfa pasture, if the greatest use is to be obtained from this pasture. Many hogs, too, have a habit of rooting in the pen. This is most common among brood sows at time of heat. In cases where a dirt floor is used, or where planks and troughs can be rooted up, the ringing of pigs is advisable. The operation is simple, cheap, and effective. It is almost the only way that a notorious hog can be taught to behave.

NO MAGNET HAS EVER WORN OUT — The First Magnet is Still Running Perfectly

50 YEARS SERVICE

The Cheapest Separator in the Long Run

"No Magnet has ever worn out"—do you realize all that says for the splendid construction, the sound materials, the honest workmanship that goes into EVERY Magnet Cream Separator? The first Magnet ever built has given in our own factory the equal of 50 yeare twice-a-day service. And it skims perfectly to-day—just as it did the day we built it. A separator that delivers every ounce of cream throughout a lifetime of use is surely the cheapest separator you can invest in. And you need pay only a few cents for repairs—the Magnet is built on true mechanical lines from sound, hard-workin material. We built for sturdiness and strength, not cheapness, and we are satisfied with the Magnet—just as every owner is completely satisfied.

GETS EVERY DROP OF CREAM

So perfect is the design of the Magnet skimmer that it will skim milk hot or cold. No wobbling—the balance and weight of the Magnet allows proper skimming even when the machine is not level. And the double support of the bowl—running at top and bottom on bronze cushion bearings—ensures every drop of cream being taken cleanly and quickly.

EASY TO CLEAN

EASY TO RUN

LASTS 50 YEARS

MAGNET CREAM-SEPARATORS

A CHILD CAN RUN IT

There's just the exactness of construction in the Magnet—just the careful balance and heft in the square gears that makes this long-life separator so easy running that even a child can manage it. No sudden pull-up of speed when milk is poured into the tank—the heft of the gears carries the weight. Many farmers have written us telling us their children do the separating.

ONE-PIECE SKIMMER

No awkward discs in the Magnet Skimmer. It's different in design and better for skimming right down to the last drop. Open, and so never chokes up. Impossible to get clogged with dirt.

EASY TO CLEAN AS A MILK PAN

Five minutes, no more, is all you need to devote to the cleaning of the Magnet. Skimmer bowl and spouts are detachable in a moment. Skimmer, too, is one-piece so that you can easily clean with a brush. Every part is open and easy to get at,—no cracks, or crannies to retain into. "Magnet" saves hours of toil for you in your dairy. Sweet and clean in next to no time.

Write To-day for Demonstration

FREE Say you are interested and at once you will receive from us our illustrated catalog telling you about the Magnet its history, its special features. Also it will show you what other farmers think of this wonderful Made-in-Canada separator. And if you wish we will gladly bring a Magnet to your own dairy and show you just what it can do—this at not a cent of cost to you.

DAIRYING.

DEPARTMENT OF AGRICULTURE
PROVINCE OF NOVA SCOTIA

Truro, N. S., July 24, 1916.

Editor Maritime Farmer:

I enclose an article which I clipped out of the Creamery Journal of Iowa. I think possibly this will be of interest to many of your readers.

W. A. MacKAY,
Dairy Superintendent, N. S.

BLAZERS OF THE TRAIL

Why is the butter maker asked to do everything?

This is the question which is asked on every side whenever a bunch of butter makers get together, whether the occasion be a national or state convention or merely a gathering of a small group

Upon first thought it does appear to be unjust that the man who works hard all day in a creamery should be asked to go outside his plant and spend his spare time trying to improve the conditions of his patrons. In most cases he is working for a salary and has no share in the profits of the plant. Why, then, should he work overtime trying to bring about conditions which will mean more money to the patron, but will not add a dime to the butter maker's pocketbook?

"Give us quality." "Make your butter of uniform grade," demands the butter merchant. If the butter maker knows his business he is utilizing the best methods in making his butter, and it is the condition of the raw material which is causing the lack of uniformity and the poor quality. This means that he is called upon to plead with the patrons to take better care of their cream and bring it to him oftener in order that he may make better butter and draw a higher price in the market. Where the creamery is run on a co-operative basis, or where a premium is offered for good cream, this means money in the patrons' pocketbooks; the butter maker does not profit a cent, yet he is called upon to plead and argue and make wild promises in order to turn more money into the pockets of the very men who howl about what the butter maker asks.

"Help organize cow testing associations, so that your patrons may get more milk and make more money from their herds," is the cry of the agricultural colleges and dairy papers. Why? It doesn't mean any more money for the butter maker, perhaps; only more work.

"Beautify your creamery grounds; paint up; clean up," is another group's plea. Why? It may mean that the improved appearance of the creamery will increase its value, but is that putting any more money in the butter maker's pocket?

"Talk dairying to the grain farmer." "Get in line with the educational work." "Learn to detect leaks that are losing money for the creamery," and dozens of other similar propositions are asking the assistance of the butter maker. Why? Does it mean more money for him?

Why is the butter maker asked to do everything?

Take this question of an employee of a large corporation, put him in the place of the butter maker, tell him he is expected to do all these things for his employers without any apparent reward in sight, and what is the result? Instead of uttering a whine of despair and complaining that he is given everything to do and gets nothig for doing it, he will straighten his shoulders and go at his task with new real. Why? Because he feels that he is needed, that he is necessary to his firm's success—that he is doing a man's work. His business training has taught him that he can get no more out of his work than what he puts into it, and that there is no royal road to success. His own efforts must earn his reward, and while his employers are apparently allowing his work to go unappreciated he knows that sooner or later they must recognize his merits or some other firm will.

The butter maker who is not content with standing still realizes this also. He is going after better cream, he is helping to organize cow-testing associations, he is beautifying his creamery and the grounds around the creamery, he is boosting dairying and trying to get more raw material, he is looking after the little details in his plant and attempting to improve his own methods. Why? Because he knows that while he may be working for a bunch of directors who will take all they can get and ask for more without being willing to pay for what they get, sooner or later he is going to take a big step up. Either his employers are going to have to "come clean" with more money or some other creamery is going to take him away from them.

Times are changing. Where but a short time ago it was customary for the butter maker to stay for life at just the salary he received when he started working directors are beginning to realize the fact that it's the dollar that talks, and if they are going to get every penny out of their creamery which it is capable of producing they have no place for a "cheap" man, for they are finding out that he is liable to be cheap in more than one sense of the word. The time is not far distant when butter making will be appreciated as being the highly specialized technical profession which it has become, and the men who are vitally interested in the business will learn that a good butter maker is worth a salary which is something more than an insult.

When the time comes when this fact is more generally appreciated some of those butter makers who are asking "What's the use?" will be wondering why they do not seem to be getting any place while the young fellow over in the neighboring community is going further every year. If they will stop and notice they will find that these are the men who didn't ask "Why is the butter maker asked to do everything?" but who went ahead and blazed the trail to better dairying, who saw that their own future rested on their ability to make good even when their efforts apparently put money in their patrons' pockets and meant nothing but extra work for the butter maker. They were working for better positions and more money in the future, it is true, but they were also working because they took pride in their work. They are the kind of men who would succeed in any business, for, no matter what their present salary may be, in a broad sense of the phrase they are "high-priced" men.

BUTTERMILK AS A BEVERAGE

The use of buttermilk or culture buttermilk as a beverage is increasing. This increase no doubt has been stimulated by the writings of the noted Russian scientist. Dr. Metchnikoff. In his book, "The Prolongation of Life," he states that the use of fermented milk in combating autointoxication—toxic fermentations in the intestines—is based on the priciple of lactic acid bacteria, and that the products of their growth prevent or retard the growth of the toxin-producing germs in the intestinal tract.

Many physicians have prescribed buttermilk for medicinal purposes. It is believed that it may be used successfully as a remedy for kidney troubles. Buttermilk has, in addition to being a pleasant beverage, valuable food qualities. The composition of average buttermilk is: water, 90.50; fat, 0.20; casein and albumin, 3.30; milk sugar, 5.30; ash 0.70 per cent. It will be seen that buttermilk has practiccally the same food value as skim milk.

One of the first fermented drinks known to European peoples was kefir. This beverage of fermented milk had been used by the peoples of southern Russian, Turkey, and the Balkan countries for many centuries. There are

TOURIST TRAVEL TO ALASKA

Summer travel is now at its height and intending tourists are reminded of the many attractive features of a trip over the Grand Trunk and Grand Trunk Pacific Railways,—of all perhaps that westbound through Prince Rupert to Alaska is the finest.

This service has been further improved by the inauguration of faster schedules between Prince Rupert and Skagway.

The steamer leaving Prince Rupert at 12 noon Wednesday will hereafter arrive at Skagway at 8 a.m. Friday. Southbound steamer will leave Skagway at 7 p.m. Saturday.

This service will enable passengers to make trips through to White Horse and return while vessel is in port.

Descriptive booklet "Alaska" will be mailed on application to:

no records and but few traditions of the origin of the fermented milks they used. It is probable that their preparation and use developed gradually by cumulative experience. This drink was first made in the Caucasus Mountains from milk of cows, sheep, and goats. Different tribes made it under different names, and all the names are said to be derived from a root signifying a pleasant taste.

In Chicago there is quite a large business done by a Jewish creamery selling thick sour cream to be used in the place of butter for spreading over bread. Spreading bread with sour cream is general among Jewish people in other cities. The sale of culture butter has become quite a business with some milk dealers. It is said that the saloons do an etxensive business selling culture buttermilk to customers at the same price as beer. I know of one firm that has worked up a considerable business by selling what it terms "creamed buttermilk"—that is, buttermilk fortified by having some cream mixed with it.

Originally the term "buttermilk" meant the by-product of butter making, or the portion of cream that remained after the fat had been churned out of the cream. As cream normally is churned sour, the casein of the buttermilk is in a precipitated and finely divided condition. The casein remains suspended in the liquid for several hours, but gradually settles to the bottom, leaving a transparent whey on top. Occasional stirring keeps the buttermilk in its homogeneous milky condition. When it comes from fresh and properly ripened cream it is a refreshing, delicious drink. The old custom of obtaining butter by churning sour milk still prevails on a large scale in the American south. There buttermilk is the by-product of churning milk, and it is a common and popular drink in the southern homes and public eating places.

Lactic acid-producing bacteria, which cause milk and cream to sour, produce not more than 1 per cent of acid. Metchnikoff's bacillus, or bacillus Bulgaricus, which is used quite extensively in the preparation of culture buttermilk, is capable of producing as much as 3 per cent lactic acid if allowed to stand long enough. Bacillus Bulgaricus produces a viscous curd which will not settle to the bottom. In preparing a mother starter, which can be used from time to time for souring additional lots of milk, take a quart of skim milk, or whole milk, boil it or pasteurize it to destroy the bacteria present, cool back to a temperature of 70 degrees F., and add to this a pulverized lactic acid tablet; cover, and let stand from 12 to 24 hours. As soon as the milk is coagulated it is ready for use, and should be stirred before serving.

In preparing culture buttermilk from day to day, add from 1 to 2 per cent of the soured buttermilk of the previous day's make. If Bacillus Bulgaricus is used the temperature of milk to be soured should be 100 degrees F. instead of 70 degrees F. Some follow the practice of souring a lot of milk with lactic acid tablets and an equal amount with Bulgarian tablets. After the two lots are soured they are placed in a churn and thoroughly mixed by churning to a smooth consistency.

In preparing buttermilk some add a little whole milk or cream, so that particles of fat will be seen floating around on the surface when churned, thereby having the appearance of the old-style buttermilk. One gallon of whole milk to 20 gallons of skim milk will give a good combination when soured and churned. Tablets can be purchased from dairy supply houses.

Bacillus Bulgaricus is a lover of high temperatures and will persist in the digestive tract much longer than the common lactic acid germ. Bulgarian buttermilk will stand heat and long age without wheying off, but the flavor of Bulgarian buttermilk is sharp and astringent or coarse. The flavor of the lactic acid culture is pleasant. By combining the two cultures a fine-flavored beverage which does not whey off is produced.—G. L. McKay, in the Breeders' Gazette.

Don't wait until winter and then wish you had a silo—order one today

Everyone nowadays appreciates the necessity of silage for milch cows, beef cattle, or sheep, if they are to be profitably fed. No other feed equals it. No other feed is so economical. You want a silo and need one. You can not save anything by delaying your purchase. Act at once so that next winter you will be prepared to get the most profit from your livestock. The silo will pay for itself before spring. Order now an

IDEAL GREEN FEED SILO

It will give you longer service, a better quality of silage, and more profit on the investment than any "cheap" silo or silo you can erect from "cheap" material. This has been proved by the experience of many farmers who have tried both. It is simply another illustration of the best being the least expensive in the long run. In better silage, the Ideal will save the difference between its cost and that of an inferior silo the first season you use it.

The time to erect a silo is at hand. Don't wait, or you will be put to extra expense in rushing your silo up in time to fill. If you wait too long, you may have to go through another winter without a silo.

Ask for complete information regarding the Ideal. Our large illustrated catalogue will interest you. A copy will be sent on request. Better still, order your Ideal today. There is no better silo made. You take no chances. Its value has been proved on thousands of Canadian farms.

THE HORSE

BREEDING HORSES TO COLOR

The ambition of the breeder is to produce animals of a certain character at will. Out of all the good herds he gets a few which come up to his ideal of perfection. The object of his work is to make all his young stuff uniform and of high grade. The breeders of Hereford cattle can foretell the color and marking of all their animals, as can the breeders of AberdeenAngus. These breeds of cattle breed uniform to color because all other color tendencies have been bred out or eliminated.

The behavior of coat colors in horses is instructive. There is not a blending, but a segregation of colors. So complete is the segregation that it is possible to breed horses of any desired color. This has not been done on any large scale except with the Suffolk. There are over 12,000 Suffolks registered, and all are chestnuts. There can be no such a thing as a gray, bay, or black Suffolk. This is so because the foundation stock from which the Suffolk sprang in 1768 was chestnut. The horse of chestnut coat color has lost the physical material that can produce gray, bay, and black. Chestnut horses breed true for chestnut because they carry no property for any other coat color. To establish a family of chestnut horses in a breed is easy; all that is required is to make chestnut matings.

There is a belief among some horse breeders that a chestnut horse whose ancestry for several generations has been chestnut is more prepotent than one whose parents are of other colors. Often in mating gray, bay, and black horses indiscriminately the product is chestnut. Horses of such origin are just as strong in producing chestnut color as horses of pure chestnut ancestry. It seems that so long as there is present in the make-up of a horse the physical basis for other colors chestnut cannot appear. It is held in check; it is not allowed to express itself. This is because it is a weaker color than dun, roan, gray, bay, and black.

There should be no confusion when chestnut is designated the weaker color. This tsatement is true from the standpoint of heredity only. It does not mean that the horse is weak or inferior. The strongest and best horses may have a chestnut color. To breed chestnut horses all that is required is to have the sire and dam chestnut. There is no necessity of inquiring about the ancestry of the parents. When horses possess chestnut color they will breed true for it.

It is somewhat more difficult to establish a family of black horses. The starting point is to select black individuals. Some of these will be pure for black color and some will have suppressed a basis for chestnut color. There is no way to find out which ones may carry the latent element of chestnut except by breeding. Those which throw chestnuts are not pure for black and should be cast off.

Brown is genetically a bay, and can for breeding purposes be classed with it. Bay is stronger than black and chestnut. It breeds true except for the two weaker colors. A bay horse can carry the physical elements for bay, black, and chestnut. I have a tabulation of 3,712 bay matings. The result of these matings are: bay foals 3,131, black foals 107, chestnut foals 474. That is, bay coat color will breed true in 84 per cent of the foals produced. The breeding test will reveal the individuals which carry bay only. Selecting these will soon give the breeder a pure family of bays. The test for a pure bay stallion is easier to make than for the mare. A stallion mated to black and chestnut mares that produce nothing but bay foals can be counted as pure for bay. The Cleveland Bay is the only breed of horses whose color must be bay.

Gray is stronger than bay. To secure a family of gray horses it will be necessary to eliminate those individuals of gray color that carry latent the elements for any or all the three weaker colors. A gray stallion used on solid colored mares which produce all grays can be considered pure for gray.

It is not desirable that horses shall be bred true to color. The color does not necessarily carry with it either good or bad qualities. It is transmitted independently of size, strength, speed, endurance, style, and beauty. There is a possibility that in some individuals it may be linked in transmission with other qualities. However, the link has not as yet been proved. A worthless horse may have the best of color, while the best horse is liable to have the ugliest shade.

The law of color inheritance is valuable in showing the method by which necessary traits can be secured and bred true in domestic animals. Certainty in breeding can be accomplished only when pure characters are being mated in the breeding stock. Breeding stock is likely to have many, many traits which the operator will want pure in addition to coat color.—W. S. Anderson, Kentucky Experiment Station, in Breeders' Gazette.

HORSE COMFORT AT NIGHT

Horses cannot work and still keep comfortable in hot weather, but there is no reason why they cannot be made comfortable nights. If they sweat the whole night long in hot, stuffy stables they are not fit for the hardest work. Continual sweating reduces vitality and often throws them off feed to such an extent that they are weak and lifeless at work.

The common plan of turning the horses out of the stable after supper is just the thing needed at this time of year. After the grass is well hardened by the summer heat night pasturing does not reduce working capacity. If there is no pasture handy for the horses it is better to turn them in the barn lot with a tank full of water and a rack of hay than leave them confined in a hot stable. The open night air is cool enough to stop sweating, and the horse is much refreshed and invigorated by it. Even the fact that they get water to drink at night would be worth all the trouble of turning horses out. Most farm horses are never watered after supper if they stay in the stable. Any working horse needs water then especially in summer. It is impossible for a thirsty horse to gauge the amount of water his system requires when he goes to the trough from a hot day's work. After filling up on dry hay and grain he is thirsty again. If there is no water until morning the system may run injuriously low in the supply of fluids. In well-regulated city stables horses are watered at night after eating their hay. The freedom of a barn lot or pasture with water at will all night is still better. Horses so handled are not thirsty in the morning, and sometimes do not even care to drink after breakfast. They go to work feeling fresh and rested, and are much less apt to become overheated than horses which pass uncomfortable nights.

Careful attention to the health of horses in hot weather, and watching for the first danger signals in the field, enable some of the greatest hustlers with farm operations to get a surprising amount of harvest work done with each horse, and without ever killing one from heat. It pays to be careful and to anticipate hot weather trouble so as to prevent it. An overheated horse is a poor piece of property, and the overheating can be avoided.

Getting to town and market is becoming more a matter of time than distance, and the automobile cuts time wonderfully. It also adds to the pleasure of life and the social benefit of the farmer.

This School Girl Had Bad Fainting Spells

Was Weak and Run Down, But Dr. Chase's Nerve Food Made Complete Cure.

The most critical time in a girl's life comes during the school age, when she is impelled by rivalry to put forth her best efforts in studying for examinations. At the time she should have healthful outdoor exercise and abundance of fresh air to keep the blood pure and rich, she is confined by her studies. Is it any wonder that she becomes run down in health and suffers from headaches, indigestion, loss of appetite and spells of weakness or fainting?

The case described in this letter is a good illustration, and you can read here the splendid results of using Dr. Chase's Nerve Food to help through this critical period.

Mrs. H. Houston, Highland Grove, Ont., writes:

"While attending school my daughter became weak and very much run down. She was frequently troubled with bad fainting spells, and nothing we tried seemed to do her any good. We were advised to try Dr. Chase's Nerve Food, and did so with most satisfactory results. I am pleased to tell you that after using five boxes of the Nerve Food she was completely cured, and has no return of the fainting spells."

This statement is certified to by Mr. Hamilton Houston, Justice of the Peace.

The reason Dr. Chase's Nerve Food is so effective in cases of this kind is because of its extraordinary blood forming influence. By creating an abundance of rich red blood it strengthens the action of the heart, revitalizes the exhausted nerves and builds up the system in every way.

The appetite is restored, digestion improves, you rest and sleep well, and the new vigor and energy is felt in every organ of the human body. Dr. Chase's Nerve Food is doing wonders for men, women and children whose systems have become weak and run down. 50 cents a box, 6 for $2.50. All dealers, or Edmanson, Bates & Co., Limited, Toronto.

THE FALL TERM
of the
Fredericton Business College
will open on
Monday, Aug. 28, 1916

Booklet descriptive of our courses of study and rates of tuition will be sent on application. Address

W. J. OSBORNE, Principal,
Fredericton, N. B.

No Summer Vacation

Will be given this year, but we will do our "bit" by fitting young men and women for the work that is waiting for them.

Students can enter at any time.

Send for catalogue.

THE ST. JOHN BUSINESS COLLEGE

S. KERR, Principal

POULTRY

CO-OPERATIVE FATTENING OF CHICKENS

The announcement is made by the Poultry Department of Manitoba Agricultural College that chickens will this fall again be fattened there on the co operative plan. Last year upwards of seventy farmers, located all over Manitoba, shipped their chickens to the college to be fattened, the shipments aggregating 1567 chickens, and selling, when finished for $1,559, or 99½ cents apiece. The birds were sold with heads and feet on and were undrawn. The following prices were received: N. 1 birds, highest price, 25 cents; lowest price, 20 cents. No. 2 birds, highest price, 18 cents; lowest price, 16 cents.

About 75 per cent of the carcases graded No. 1. Had it not been for 75 old hens shipped in by the consignors the average price would have been higher.

The best gains were made last year with chickens weighing about four pounds each. Fifty Buff Orpingtons sent by Mrs. Gill, Rathwell, gained 81 pounds in the three weeks; even this rate of gain was beaten by many small lots.

The breeds largely received were Plymouth Rocks, Wyandotts, Orpingtons, and Rhode Island Reds. The Barred Rocks were probably the most satisfactory; they ate well during the whole period, made good gains, and graded the largest percentage of No 1 carcases. Some Leghorns were sent in, but they were unsatisfactory from a feeder's standpoint.

The carcases were sold to the produce handling stores of Winnipeg.

This year chickens of the heavy breeds will again be received, also turkeys. Positively no Leghorns, old hens, ducks, or geese will be taken. Consignments of chickens may be shipped from early September, provided they average three pounds or over per bird. Turkeys will be received any time after October 1st. There should be a good demand for chickens this year, with prices higher than one year ago, and there is a shortage of turkeys. Farmers, therefore, are urged to keep their young stock growing right along during the summer.

SEPARATING THE SEXES OF FOWLS

It has been proved by more than one experiment that hens lay more eggs when separated from male birds than they do if kept constantly mated. Pullets mature in better form if separated from cockerels as soon as the sexes can be determined with certainty. It is better to sell the cockerels for market purposes than to keep them until older, and only such as are to be reserved for breeders should be kept, and these should be shut by themselves. Cockerels that are kept separated from hens and pullets until they are to be used are better as breeders. Eggs from hens kept away from male birds keep longer. Male birds kept confined are better off than if allowed to run at large. All this shows that it is a profitable practice to separate the sexes during all the time that hatching is not going on. It makes a little trouble to keep the male birds confined, but it pays in better conditions for the females, in earlier maturity, greater egg production, and larger profits.

CELERY CABBAGE FOR GREEN FEED

Have any of our Farmer readers ever tried celery cabbage for green feed for their poultry? About the 15th June the editor's little boy sowed a five-cent package of celery cabbage seed on a plot containing fifty square feet. It is now about 15 inches tall. It made a very thick stand and by judicious thinning it appears as if there will be enough to afford a bountiful supply of green feed for the flock of twenty hens for the remainder of the season and leave a good number of heads to hang up after the snow flies. We find celery cabbage does not wilt so readily as some other greens we have tried, as it is very juicy, fleshy, and brittle. It is first choice with our hens when fed with other varieties, and they are responding very well indeed. During the last month they have averaged about 17 eggs per day.

STORRS CONTEST NOTES

The 1,000 hens in the international egg-laying contest at Storrs, Connecticut, made a slight gain in production during the 35th week, ending July 2, whereas all signs pointed to a falling off in production. They laid a total of 4,212 eggs, which is 325 in excess of the yield for the corresponding week last year. Two pens of Leghorns belonging to P. G. Platt, of Wallingford, Pa., and Will Baron, of Bartle, England, tied for first place for the week with 59 eggs each. Dr. N. W. Sanborn's Buff Wyandotes, of Holden, Mass.; Elmwood Farm's Mottled Anconas, of Little Falls, N. Y.; and four pens of Leghorns owned by Branford Farm, of Croton, Conn.; Harry Williams, of Bridgeport, Conn.; James H. Lord, of Methuen, Mass.; and Abel Lathan, of Brierfield, England, all tied for second place with 55 eggs each. Four pens tied for third with a score of 54 eggs each.

"DOG DAYS"
the best time to buy a
DE LAVAL
SEPARATOR

THERE WAS NEVER BEFORE as good a time to buy a De Laval Cream Separator as right now.

THE "DOG DAYS" ARE AT hand when dairying is most difficult without a separator and when the increase in quantity and improvement in quality of cream and butter are greatest through the use of a good separator.

THEN THERE IS THE GREAT saving of time and labor, which counts for more in summer than at any other season and often alone saves the cost of the separator, aside from all its other advantages.

THIS IS LIKEWISE THE SEASON when De Laval superiority counts for most over other separators, in closer skimming, larger capacity, easier running, easier handling, easier cleaning, and absolute sanitariness.

A DE LAVAL CREAM SEPARator bought now will easily save its cost before the end of the year, and it may be bought for cash or on such liberal terms as to actually pay for itself.

Look up the nearest De Laval agent AT ONCE, or drop us a line and we will have him look you up.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience,** we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment; If you suffer from **pain in the head, back,** or **bowels, feeling of weight** and **dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid,** to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured,** my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all—**young or old.** To Mothers of **Daughters,** I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask for the free treatment to-day,** as you may not see this offer again. Address:

FOR HOME AND COUNTRY

This Department is devoted to the best interests of the Homes of the Maritime Provinces. Contributors to these columns are leaders in the "For Home and Country" movement. This Department is yours. Use it to the best advantage by sending us timely suggestions, short articles dealing with your experiences, and reports of your Institute meetings.

For the Sake of a Woman

First I think it was sheer panic at the prospect of banishment from one's own kind that drove us together. At any rate, I never encountered a more heterogeneous impossible herd than made up the passenger list on that trip. Even before "All ashore!" had been called I had mentally sifted down to Norling as my only possible hope of human companionship.

He told me afterwards, in that frank spontaneous way of his, that he had come to the same conclusion regarding me, which probably accounts for the fact that before the first day was over we had slid into a delightful and exclusive partnership for escaping boredom. I gathered that this Hawaiian trip was supposed to be an education.

Our mutual esteem was still running high as we leaned over the rail, watching Honolulu grow up out of the perspective, and were laying our plans for the first day ashore. It was an old story to me, but I had plenty of amusement explaining the harbor sights to Norling, until a bevy of information-hungry old maids fell upon me as an animated lecturer and pestered me with questions. Finally we managed to disentangle ourselves without brutality, and shifted forward.

The harbor activity was focussing upon us, the arrival of the big passenger ships being a rather important happening. While I was watching two old Chinamen in a sampan-like ark and tryink to figure out how they managed to keep afloat, Norling gave a sudden tug at my arm.

"Some one in the boat over there is trying to attract your attention, I think," he said.

Surely enough it was. I looked over toward the trim cutter, manned by bluejackets, and in the sternsheets discerned one of my boon familiars, Lieutenant Bobby Nicholson. Manifestly, Bobby was shouting and making frantic signs, but they were about as informative as the gestures of a crab. I couldn't hear above the din. But I did some non-committal wigwagging myself.

Within a few minutes we had warped into the dock. Thanks to the wheels of my experience, oiled with some coin of the realm, we soon had our hand luggage ashore and were pushing our way to safety through the regiment of professional assisters. We found Bobby Nicholson standing impatiently in front of the hotel when we got there. He had ridden.

"I'm in an awful rush," he spluttered after he had metaphorically fallen on my neck, and had been introduced to Norling. "Came to tell you to be sure to be at the blowout at the Colonial Club tonight. Bring your friend. Sure to have a good time. Didn't know you'd be back or I'd have sent you invitations. Good thing I saw you from the cutter. Well, so long. See you later. I'll be late for duty."

He was off with a rush. Then suddenly he wheeled in the centre of the driveway, and, shading his eyes from the sun, called back:

"I forgot to tell you your friend Drewit got back to town yesterday from Wailuku."

"Is he——" I began, starting after him; but he anticipated my query and called over his shoulder half mockingly, half pityingly:

"Yes, he is; worse than ever."

Then he was gone.

My face must have betrayed the sickening wrench at my heart. As I turned to Norling, who had heard the whole conversation, he laid his hand on my arm sympathetically.

"Is it," he said softly, "is it some one you care for?"

I told him. Sidney Drewit and I had been boyhood chums at home—chums through school; and then, years after, had picked up the thread of our friendship again in Honolulu. I told him of the ambitions and bright prospects of Drewit, which suddenly a year before he had overturned and cast aside like an empty cup. Since then he had been drinking himself to death—literally going to the devil, and seeming to glory only in the downward progress.

"But why?" asked Norling compassionately, "has he done it?"

"A woman," I rejoined. "Yes, a woman was the cause, although he has never mentioned it even to me. He had been engaged to a girl in England, but after he set out to perdition he ever spoke of her."

"Poor chap, poor chap!" said Norling softly. "We must do something for him; there may have been a mistake."

* * * *

Among the Britshers at the club that evening was Drewit, and I saw at a glance he had aged ten years in the six months since I had last seen him.

He kept one of the Chinese waiters almost exclusively busy serving him with drinks—big drinks—which he tossed off raw mechanically without a wince.

Later in the evening he came over to where Norling and I were hobnobbing with a couple of my intimates—Drewit's intimates, too, including Nicholson. Apparently Drewit was sober, but it struck me ominously it would have been better if he had not been after the brandy he had drunk. There were stories and jokes, and finally, as men will, afar from home, we reached the toasts.

Bobby Nicholson led off with a panegyric to "The Navy." Dixon, who had succeeded in the colony, toasted "Fair Honolulu," and some one toasted "God's Own Country." Finally some one called on Norling. He sprang to his feet enthusiastically. He raised his glass.

"To woman," he cried, "God's best gift to man!"

We were standing, glasses uplifted, ready to complete the ceremony, when I saw a peculiar change come suddenly over Drewit's face. With a curse, he hurled his glass from him, and its contents spread over the white cloth like splotches of blood. Then he wheeled fiercely, and shouted, with almost maniacal fury:

"That for women—all of them!"

Quicker than the eye could follow, a flush dyed Norling's face, and before we could prevent him he struck Drewit full between the eyes. Then we got between them. Not that it was necessary, though, because Drewit only sank to his seat and held his hand to the livid welt on his forehead. The old look of furtive despair had come back into his eyes. It struck me as almost disappointing that he had not resented the blow. But common sense triumphed, and I realized that if we could avoid scandal the thing must be patched up. Besides, my heart ached for both men—for Drewit, that he had been humiliated, justly though it was; for Norling because his reason had resumed sway and he was suffering from the sting of remorse at having sacrificed any hope of helping the man he pitied. Drewit was looking at me appealingly, and it suggested a solution for the time being.

"Come on, Drewit," I said, "and you, Norling—you are both my friends—let's walk out into the cool night air together. It will clear our heads and show us what fools we can make of ourselves."

It struck me as strange that Drewit needed little persuasion, although Norling, openly repentant, seconded the appeal. Not one of us spoke until we had walked far up the deserted street. It was Norling at last who broke the silence.

"I am a brute and a cad," he said to Drewit; "not fit to associate with gentlemen, and I ask you to forgive me. I will apologize publicly."

"It was my own fault," rejoined Drewit dully.

"No," said Norling, "you did not understand my feelings, and I want you to know, so that you can forgive me."

Drewit turned and placed his hand on Norling's shoulder.

"My boy," he began; and then he paused as if in search of words.

"My boy," he repeated, "it is I who should ask forgiveness of you. Tonight has shown me there are two sides to every shield, and I must show you mine, so you will understand my bitterness and at the same time value the love of that good woman—back home. I have never spoken before, and I need not ask you to respect my confidence."

Norling and I simply nodded.

"To make the thing clear," continued Drewit, his voice hard and dry, "you should know that I once felt toward a woman as you feel—now. I placed her so high in my heart she seemed to me the well-spring of everything in the world that was good and true and worth a man's best effort. She was my savation. I was too poor to marry then, and so I came out here and struggled and denied myself, and then, when the goal seemed just within my reach, when I thought I had won my happiness, I found I had been worshipping a hollow mockery."

Drewit stopped and shuddered, drawing his hand across his eyes in a dazed sort of way, while we waited in painful silence. At last he pulled himself together.

"She wrote me she could not marry me; that she was engaged to another man," he continued, in a colorless monotone. "If she had loved the man I could have forgiven her, because I loved her enough to know what love does to one. But she did not even allow me to retain my respect for her—that was the worst of all.

"It was ambition, selfishness, feminine vanity, that actuated her. Calmly, with a cool kindness, she wrote me she loved me better than the man she was to marry, but that he was rich and I was not. Every moment, she said, even while she was with this man, enjoying the luxury she was too weak to refuse, her heart would be with me. According to her standard, she regarded this confession as a balm for the wound she had inflicted. She was incapable of understanding that she had shattered more than my hope of happiness with her—that she was poisoning my very soul against life itself. And that is why I have never gone back. In a colony one may go to perdition without causing scandal."

He gave way to a burst of mirthless laughter. It was Norling who spoke in an awed tone.

"You should have gone back," he said. "There may have been a mistake. Loving like that, I cannot understand why you surrendered so easily."

"There was no mistake," said Drewit calmly. "I wrote several frantic letters, and received one reply that banished all doubt. I think I will read it aloud; it will convince even you."

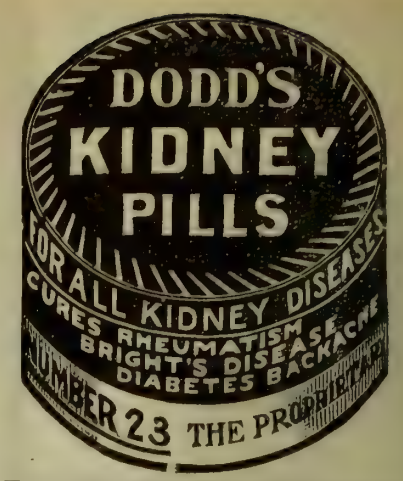
He fumbled in his wallet. Then he held up the letter so that the bright light from the moon fell upon it. The date he read was of a year before.

He began in a clear, even voice:

"My own Sweetheart Sid—It is hard for us both. But what I wrote before is true. And all the time I love you, dearest; love you as I shall never love another. I know I am spoiled and selfish and weak; but weighing in the balance against your love are wealth, position, luxury—and I cannot give them up—all that my soul craves—except you. But you must not rebel, dearest—you will forget——"

"Forget!" he muttered, half to himself. "Forget!"

From the club house in the distance,



WHY WOMEN WRITE LETTERS

To Lydia E. Pinkham Medicine Co.

Women who are well often ask "Are the letters which the Lydia E. Pinkham Medicine Co. are continually publishing, genuine?" "Are they truthful?" "Why do women write such letters?"

In answer we say that never have we published a fictitious letter or name. Never, knowingly, have we published an untruthful letter, or one without the full and written consent of the woman who wrote it.

The reason that thousands of women from all parts of the country write such grateful letters to the Lydia E. Pinkham Medicine Co. is that Lydia E. Pinkham's Vegetable Compound has brought health and happiness into their lives, once burdened with pain and suffering.

It has relieved women from some of the worst forms of female ills, from displacements, inflammation, ulceration, irregularities, nervousness, weakness, stomach troubles and from the blues.

It is impossible for any woman who is well and who has never suffered to realize how these poor, suffering women feel when restored to health; their keen desire to help other women who are suffering as they did.

Avoid waste of Fuel

Straight Walls Firepot of "Sunshine"

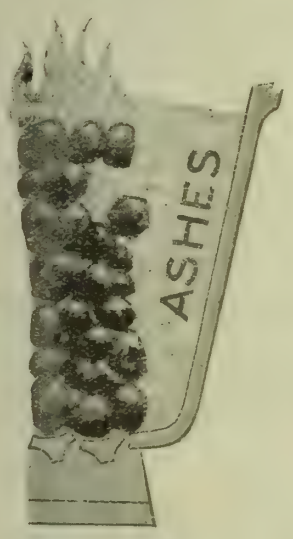
Unless you KNOW positively that a cheaper furnace will heat your home without waste of fuel, there is small satisfaction in saving a few dollars on its purchase. The Sunshine Furnace saves coal because it is well made and because every part has been carefully thought out.

☞ **LOOK IT OVER. Any one can see that the greatest heating factor in a furnace is the fire-pot; that a pot with straight walls like the Sunshine fire-pot will give off more heat than one that must often have an outer lining of ashes.**

Doors and dampers that are tightly fitted will certainly hold the fire longer than those that are loosely fitted. The wider air passages and larger radiating surfaces of the Sunshine must heat the air much more readily. These Sunshine Furnace features are coal-savers that mean much in mid-winter.

If you are looking for economical heating, you must see cearly that it will take a good modern, well-made furnace to supply it. You will naturally think well then of

McClary's Sunshine Furnace



Slanting Walls Firepot gathers ashes and decreases radiating surface

Saving coal interests you, of course. Then you will want a copy of our booklet. Send the coupon today for a copy. If you want information about the cost of heating your home, we will let you have it promptly and without charge. If you will write to our Heating Engineer, he will show you how to plan your heat distribution so as to get the utmost warmth with the least expenditure. Write him, giving the size and number of rooms in your home—a floor plan of the upstairs and downstairs—and he will give you the probable cost of putting in a system that will give you the heat you want where you want it. Fill in and send the coupon direct to the factory.

McClary's

Kindly send me without expense on my part.—

1. Your booklet on the Sunshine Furnace.

2. Also forms for filling out, so that your heating engineers can tell me how to order and install a system that will properly heat my home.

Name .....

Address .....

through the stillness of the night, came the strains of an air the band from the cruiser was playing, and borne clearly down the cool night breeze we could distinguish the melody: "Then You'll Remember Me."

"Listen!" said Drewit, with a laugh that snapped like a whiplash. "Her favorite song! She sang it the night we parted, and she gave me a bunch of forget-me-nots—her flower."

Norling started, as if to speak, apparently, but Drewit began to read again:

"This man I am to marry I cannot even respect. He is vulgar—even vulgarly rich; that is, his father is, and he will get it all. But I have stirred up unnecessary ambition in him so he would not always be dangling at my side—a living punishment for my worldliness.

"He has been a good-for-nothing, with mean tastes and instincts. You may judge when I say that he has tattooed on his arm the picture of a prize fighter. I tell you these things so you will pity me. Once during a carouse in New York he shot a man, and barely escaped punishment. I have nicknamed him 'The Savage'—he thinks from affection, being too much of a fool to suspect the truth——"

A low groan from Norling caused us to turn quickly. He had staggered back against a tree.

"What's the matter, Dickie?" I cried. "Are you ill?"

"No," he said tremulously; "only fighting with myself against belief in what I attacked Drewit for saying tonight."

He drew himself up half-heartedly, like a man that has perforce determined to face some crisis that inevitably must spell ruin for him.

He pulled up the sleeve of his coat and shirt, baring his arm.

"Look!" he cried. "Do you see the picture of Fitzsimmons tattooed on my arm? When I left she sang her favorite song: 'Then You'll Remember me,' and gave me a cluster of forget-me-nots as a token of faithfulness. She nicknamed me 'The Savage' because I was a good-for-nothing and shot a man, as she described. Because I am so vulgarly rich she takes me, although she loves Drewit."

He plunged his hand into his breast pocket, and from the packet he produced tore out a bunch of withered blossoms.

"See!" he cried, throwing them on

"Acme"

Canada's famous White or Blue Laundry Starch

For years, clever Canadian housewives have used "Acme" Starch for all their home laundry work. They know that "Acme" Starch always gives the best results. At your grocer's.

BURDOCK BLOOD BITTERS CURED DYSPEPSIA.

Unless the stomach is kept in good shape your food will not digest properly but will cause a rising and souring of food, a feeling of rawness in the stomach, pains in the stomach or a feeling as if a heavy weight were lying there.

Burdock Blood Bitters cannot be surpassed as a cure for dyspepsia and all its allied troubles.

Mr. James R. Burns, Balmoral, N.S., writes: "About two years ago I was badly troubled with dyspepsia, and could not get any relief. I tried most everything, not even the doctors seeming to do me any good. One day a friend told me to try Burdock Blood Bitters, as he had seen it advertised. I did so, and by the time the first bottle was gone I felt better, and after taking three bottles I was completely cured. I highly recommend it to all sufferers from dyspepsia."

B.B.B. is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

the ground. "I am going to stamp her out of my heart as I do these tender, lying flowers under my feet!"

* * * *

It was Drewit who placed his arm around Norling's shoulders with a masterful tenderness.

"Don't" he pleaded gently. "Don't lose your hold, as I did. I was a fool; you made me see that tonight. We understand each other—you and I—we must fight it out together."

THE CARE AND TRAINING OF CHILDREN

The subject is not new. It has existed since Eve's motherhood, and while it perhaps had little thought devoted to it in the first decade the interest has gradually increased so that today we have many books written on Children's Training, Children's Rights, or the Care of Children.

Therefore I do not expect to be able to bring forth any new ideas, but hope to so present some of the more important facts that have either lain dormant or become entirely forgotten by us that we will have a new and full understanding of this important subject.

As I am speaking chiefly to mothers, I shall try to handle the subject as best I can from a mother's standpoint.

The care and training of the child does not by any means begin with its advent into this world. Physiologists and psychologists state definitely that the influences affecting the child begin before birth. Therefore it is very necessary if we desire healthy, happy children that care and training begin them also. How can this be accomplished? Only one way. The mother-to-be needs plenty of plain, well-cooked wholesome food, plenty of fresh air and healthful exercise—but not overwork—and, above all, loose clothing and a cheerful contented mind. Many a weak or deformed child is the result of a mother's too tight clothing, and there is little doubt that many a criminal act could be traced to a mother's rebellious mind.

The Baby

With the arrival of the baby a new care is added. But, oh, how sweet a care!

See to it that the baby has plenty of warm, soft clothing; never torture the new-born babe with the old-fashioned starched, tucked and be-frilled linen slip. The dainty flesh is too tender to bear the contact without becoming irritated and sore. Bathe the baby daily; see to it that the room and water are warm, and make good speed lest the baby get chilled. Dry thoroughly by soft pressure and repeated patting. Apply a good powder to all folds and clefts.

A sure sign of the good mother is the perfect condition of these parts.

Feeding

In regard to feeding the baby, by all means give it the only ideal nourishment: that obtained from the mother. It is the only safe nourishment, for the milk goes right into the baby's mouth and never sees the light of day, and is therefore free from bacteria and germs that are likely to get into the cow's milk on its long journey from the cow to the baby, and likewise with the patent foods so highly advertised.

Sleep occupies much of baby's time twenty-two hours out of the twenty-four being required up to one month, and at least sixteen hours at six months. When sleeping give the baby a supply of fresh warm air the year round. It may sleep out of doors in summer if provided with a cool, shady place and not exposed to heat; but to wrap the baby in coat, cap, and mittens and put it out on the verandah to sleep in midwinter is, I consider, preposterous. If mother wishes a sleep she does not put on her fur coat and lie in the hammock with coverings enough to tire a mule, and tucked in so tight she cannot move. By no means; instead, she will loosen her clothing, put on her kimona, and lie with light coverings in a warm room supplied with plenty of fresh air. What comfort or rest does the baby get if while sleeping it is wrapped and bundled and weighted down with coverings?

Training

The baby's training begins very early, for no one is more susceptible to influences than the baby. Regular hours for food and sleep are essential, but these things should be carefully, not rigorously, observed. The wants of newly born babes may be subject to some variation, and the sympathy of the mother should lead her to study and gradually interpret baby's desires. Some claim crying is good for a child, but we must remember that crying is its protest against pain and discomfort, and we should not drudge giving up time to it and soothing it, thereby infusing into the little life love that will nurture it into ampler life.

When baby has reached the stage of crying for wilfulness, care must be taken to make the child recognize that the mother is not swayed by its self-will or anger, but adheres firmly to her path of steadfast love and duty. When the babe recognizes that fact an important step has been taken in its training.

As the child grows older and begins to move about at its own free will it is very natural for it to want many things that are not good for it to have. When it is trying to secure some loved article, tell the child no, no, and divert its attention by bringing forward some new thing that it may have. If ever the child has secured what it may not have, take it gently away, at the same time saying no, no. It soon learns what it may and may not have. But if persistent in securing forbidden articles, a smart slap on the hand is generally very effective and saves the child and mother heart aches which are sure to follow later if the child is allowed to continue snatching that which it may not have.

Growth

The growth from babyhood to childhood is so gradual that it is very hard to know where the dividing line is, but as truly as the child is father of the man, so is the baby father of the child; and if care is taken of the physical and mental welfare of the babe the child is more easily managed. The one thing essential for every child is happiness. It not only helps him physically, but his mental and moral forces are materially benefited, and if we desire a child healthy in mind and body, keep him in close touch with nature. He may often be mud-smeared, and as a result have torn clothing, but that is a necessary consequence of direct, useful contact with all sorts of interesting things that are helping to mold and form character. The child who has always to stop and think of his clothes first is truly to be pitied.

Children's Rights

The child has rights which we often ignore. He has the right to a genuine, free, serene, healthy, bread-and-butter childhood; but often in our Canadian homes there is so much hurry and worry, and our manner of living is so often keyed to concert pitch, that we drag the children along with us, and the result is far from satisfactory. We cannot expect a healthy, happy child under such circumstances. With the child as with the baby, he needs plain food, regular hours for sleep, and plenty of fresh air and healthful exercise.

As to the training of the child, there are many theories written, some practical and many very impracticable. There can be no hard and fast rules made for the training of children. We can generalize to a slight extent, but each individual child must have treatment peculiar to himself; and to make training a success the child must first of all be understood, for no one has a right to undertake training a child who does not first take pains to understand him. Secondly, and not less important, the person undertaking this duty must be endowed with a lot of patience, tact, calmness, an excellent memory, and plenty of firmness; but care must be taken that firmness does not shade into obstinacy. Mothers, examine yourselves, and if you do not possess all these qualities, cultivate them, for they are not of an impossible nature, and you will find ample reward for your trouble in the betterment of your child. Thirdly, let there be few rules. Many an immoral act of the child has first been suggested by the strenuous rules laid down by the parents.

Obedience

The first thing every mother should strive for is to teach the child obedience. It takes a great deal of care and time to accomplish this, but when you hear a mother flatly say of a child five or six years of age: "I simply cannot make him mind; he is beyond me," you can at once make up your mind that it is no fault of the child, but of the mother. Why does he not obey? Simply because the mother has not insisted on obedience. How often do we hear: "Harvey, you must not do that; stop now!" and similar expressions, and when the forbidden act is done we hear a doleful voice wail out: "I'll tell your father!" and straightway it is all forgotten by the mother, but not by Harvey. He knows that mother failed, and he knows that he can disobey again, and yet she will fail. Is there any wonder that he soon gets beyond her? The child loses all respect for his mother's wishes; he knows nothing and fulfils nothing but his own desires.

How different the child who, when told not to do a certain act, it is seen to that he does not do it. All young children are persistent in their wilfulness, and it is here the mother needs her memory, her patience, her tact, and her firmness. Do not be afraid to talk to the child and tell him why he should obey. Even very young children can understand a great deal if told to them simply and kindly. Do not think it silly and a waste of time to explain to the child the reason he should obey you and not do certain things. By so doing you gain the child's confidence and he soon understands that if you say he must not do cetrain things you have a good reason for saying so, and obedience comes readily. But if other methods fail to secure obedience do not be afraid to use the rod of correction.

Punishment

In these days a great deal is said against corporal punishment, due no doubt to the too frequent and severe use of corporal punishment a few generations back. But I believe that our Puritan forefathers, whose two strong points were the Bible and the birch rod, had more God-fearing and parent-respecting children than we of the twentieth century have.

I do not mean to advocate corporal punishment to any great extent, but I must say that there are times when moral suasion fails perceptibly, and if corporal punishment is brought to the

I bought a horse with a supposedly incurable ringbone for $30.00. Cured him with $1.00 worth of MINARD'S LINIMENT and sold him for $85.00. Profit on Liniment, $54.

rescue the child is often raised a good big step upward on the ladder toward obedience and character forming. When the child has learned obedience his character forming is not so hard.

Force of Example

If we wish our children to have good morals and an upright character we must set a watch upon ourselves, for the children are very susceptible to object lessons, and learn from example in one week more than they learn from a book in one year. Therefore we must be careful of our child's early companions. Much or all of our care and influence can be spoiled by the child coming in contact or companionship with a street urchin whose chief training has been to learn to dodge the police.

Keep the Child Busy

A child must be kept busy. It is his very nature to be busy, and it is our duty to provide him with something that will keep him busy. As soon as the child knows the name of familiar objects, and can walk, he can be taught to do little things for mother, such as bringing her thread or thimble, dust pan, rubbers, etc.; and these duties should enlarge as the child grows older. The child enjoys doing this, and it is training him to know he is not living for himself alone. Bestow plenty of praise; children like to be told they have done a thing well, and it stimulates them to greater effort. Be careful not to praise work that you know has been carelessly done, and it is not necessary to condemn. The child knows that he has not put forth effort, and generally your look of disappointment is not forgotten, and the careless work is not repeated. But his activity should not be all work. The child needs more hours for play than for work, and it is our duty to furnish him with toys and books suitable to his age and taste.

Trust the Child

The lack of truthfulness is sometimes found among children and is one of the hardest problems to deal with, but usually the best results are obtained by letting the child see that you are trusting him. It seems to stick to his memory that he is being trusted, and after a time he seems to feel it hardly worth while to tell or act the lie.

In the first part of this paper I stated that the child has rights which we should respect. I just wish to add one more right which belongs to the child. He has every right to be taught that other people who are not children have rights also, and he should be trained to respect those rights. He should learn that a street or concert hall filled with adults is no place for a game of tag. The child who does not respect the rights of his elders grows up a very self-satisfied and egotistical man.

Reverence

All through child training we should never lose sight of the training for reverence. Whatever our class or creed, we all believe in the Omnipotant One, and if we wish our children to be their very best, teach them love and reverence for the Divine. For, after all is said and done, true reverence for our Maker is all that makes life worth while.

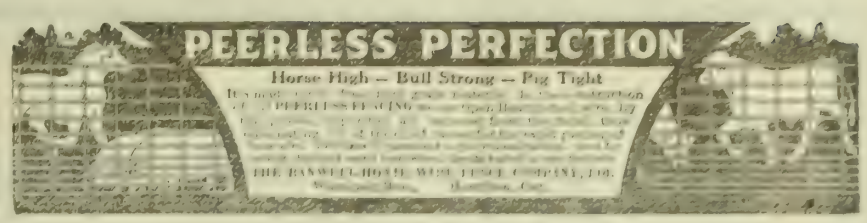

TABLE DECORATING HINT

One of the most satisfactory colors to use for table decorating is rose pink, which bears the light of the sun and artificial lights without much change. So often one plans a color scheme and, alas! when the lights are turned on the blue looks green, violet changes its hue, and yellow looks pale and faded. Red is a splendid color to use in winter, but is dangerous in combination. Menus and guest cards for flower luncheons are made by cutting leaves out of water-color paper and painting them in natural color. Next select your flowers and cut them out of cotton, spot each with its natural color and sprinkle lightly with gilt, pull out the cotton to make the flower look real. On the leaves in gilt is painted each guest's name. Large petaled flowers are the best to use. Fruits can be used in this way, making charming souvenirs if well done. Now that summer is here, a fruit luncheon, using all kinds of fruit beverages and salads in the menu, would be quite the thing.

Don't handle gasoline by the light of a lantern or other open light. If you have no electric light where the tank is located, never fill it except in daytime.

ABOUT THE HOUSE

Whip cream in a pitcher instead of a bowl, to do it in half the time and [illegible]

A cloth dipped in ammonia will often remove the stains from the collar of an overcoat.

Paraffin rubbed on the heel of stocking will cause them to [illegible] longer without wearing out.

Orange fritters are as delicious an accompaniment to broiled or fried ham as apple sauce to a spare rib.

Dates stuffed with peanut butter and then rolled in sugar are a pleasing change from dates stuffed with nuts.

In cooking beans and peas their flavor will be much better if they are cooked in as little water as possible.

If a curtain or portiere pole is rubbed with hard soap before being put up, the draperies will slip on easily.

Dates and figs cut in small pieces and served with plenty of sugar make a tasty accompaniment to a dish of rice boiled in milk.

Bess—And is Freddie in any danger from his compound fracture?

Belle—Not a bit. His nurse is a fright.

Ford Motor Company of Canada
Limited
FORD, ONTARIO

FEATURES GATHERED FROM THE NEW BRUNSWICK WOMEN'S INSTITUTE REPORTS

(Continued from page 698)

and that more institutes will take part in the competitions.

"Allied for Right" Button Day, May 21st, was a happy one for many of our institutes, when large sums of money were raised by them for the Motor Ambulance Fund. Late that night our institute handed over to the supervisor $501.40, after a thorough canvass of the city, assisted by many willing workers. Since then we have contributed small sums to the Red Cross and Patriotic Funds. We are hoping to raise more money for patriotic purposes by the sale of a Quotation Calendar.

In taking up the year's work, let us remember the words of Lowell:

"Thousands of years ago a leaf fell on soft clay and seemed to be lost. But last summer a geologist in his ramblings broke off a piece of rock with his hammer, and there lay the image of the leaf, with every little line and every vein and all the delicate tracery preserved in the stone through those cneturies. So the words we speak and the things we do today may seem to be lost, but in the great final revealing the smallest of them will appear."

Lower Kingsclear.—Organized August, 1915. Present membership 24. Have already repaired the Agricultural Hall, in which the meetings are held. Meet every week to knit and sew for the Red Cross, making hospital shirts and socks.

Meductic.—Organized in June, 1915, with a membership of 10, which has since increased to 18. Over isxty dollars has already been raised for Red Cross work. Forty-four dollars was cleared at a pie sale. Twenty dollars of this went to the Ambulance Fund and $10 to the Red Cross Society, the remainder spent in yarn for socks. Twenty dollars was raised by an autograph quilt, this to be divided between the Machine Gun Fund and more yarn. The younger members are getting up a play at which they hope to increase the funds for the work. The result of four months' work is very encouraging.

Nashwaaksis.—Organized in October, 1914, with a membership of 29, which has since increased to 41. Roll call is answered by suitable quotation. It was decided at the first meeting to take up Red Cross work, and each member gave 10 cents to start the Red Cross Fund. In November $27.25 was added to the fund by a supper, and in February $62.50 was collected by the members throughout the neighborhood for the Belgian Relief Fund. On Button Day $20 worth of "Allied for Right" buttons were sold, and $18.50 received as donations from other sources. Of this money $40 has been given to the Motor Ambulance Fund and $38 for material for Red Cross supplies, which was made up into over 100 articles for the soldiers. Besides this over 400 articles were made up from material supplied by the Daughters of the Empire, Fredericton.

A school committee is appointed every two months to visit the school. As a result two drinking fountains have been installed in the school rooms. A committee is also appointed every two months to visit the si k. The institute has been a great help socially. and we are doing our best to live up to the motto "For Home and Country." a

New Maryland.—Organized in June, 1915, with a membership of 11, which has since increased to 13. The first attempt to raise money was a pie and ice cream social, from which $57.00 was raised, and was devoted to Red Cross purposes. Twenty-five dollars was voted to the Field Ambulance Fund. Some papers have been read, such as "A Helpful Paper for a New Institute" and "Institute and Home," with brief discussions on the same subjects. We are now clothing a poor and aged lady who has no one to support her.

Cross Creek and Stanley.—Organized in November, 1913, with a membrship of 18, which has since increased to 40. The principal work carried on is Red Cross work. One hundred and ninety-one dollars and ninety cents has been expended on soldiers' comforts and hospital work. This has been raised through teas, concerts, and mite boxes. Cross Creek and Stanley each have separate beds endowed in the Canadian Hospital in France. A contribution of $40 was given for flour for the Belgians, and $130 was raised toward the Machine Gun Fund. Programmes are in the form of a wall calendar, Cross Creek making out six months' programme and Stanley the remaining six. Red Cross work is forwarded to the Daughters of the Empire, Fredericton.

Southampton.—Organized in June, 1915, with a membership of 16. Present membership 25. Since organization $27 has been raised for Red Cross work. Forty articles, including socks and hospital supplies, have been forwarded to the Daughters of the Empire, Fredericton. No institute work has as yet been undertaken. The Red Cross work is very essential, and we hope to branch out along other lines as well.

Tay Settlement.—Organized in June, 1915, with membership of 26, which has since increased to 41. The principal work so far has been knitting and sewing for the soldiers. Money to carry on Red Cross work has been raised in various ways. The first money was a donation of $40, the proceeds of a social. An ice cream social in July netted $45. Twenty-five dollars of this was donated to the Motor Ambulance Fund. In September the gross receipts of a concert and fancy sale amounted to $107. The roll call has been answered by Household Hints, Proverbs, Jokes, Quotations, etc. Interesting papers have been read on "The Present War," "Current Events," "Home Nursing," etc. Recipes have been exchanged and discussions held on "Preserving Fruits," "Canning Vegetables," "Books We Should Read," and "School Improvements." The young girls have taken a great interest in the work. Of the 41 members, 20 are young girls. Our institute work is still in its infancy, but we feel that a great deal of good can be done by the united efforts of the women. Meeting together with a common interest will result in a better feeling of friendship and neighborliness, which is in itself worth while.

Williamsburg.—Organized in October, 1914, with membership of 16, which later increased to 26. No special subjects have been taken up by the institute. On the 24th of May an entertainment was held, realizing $93. This was used to endow a bed in the Duchess of Connaught Hospital in England; $20 to the Ambulance Fund; and the remainder expended on material for Red Cross work. One hundred articles, including socks and hospital supplies, have already been forwarded to the Daughters of the Empire.

THE CLOVER CROP

(Continued from page 696)

the use of a clover-huller. This machine will be stationed at some point centrally located in various districts where the number of farmers served will warrant its being operated.—O. C. Hicks, Soils and Crops Division, New Brunswick Department of Agriculture, Fredericton.

"SWAT THE COCKEREL"

While you are swatting the old "rooster," swat the young one and make him a capon. June is the best time for caponizing surplus cockerels. If young birds are beginning to develop combs and wattles they are ready for the operation. The heavy breeds should be caponized at about two to two and a half pounds; the light breeds one and a half to two pounds. Rocks, Wyandottes, and Reds make the choicest capons.

Many people have hesitated going into this phase of poultry production because of the common opinion that the operation was a difficult one. This is not the case. With very little experience an operator should not have over 5 per cent loss. Since these nearly all result from a severed artery at the time of the operation, such birds can be killed at once and used for food. One can become familiar with the details of the operation from the directions which accompany each set of instruments, or from Farmers' Bulletin 452, United States Department of Agriculture, Washington, D. C.

Practice shows that a 10-pound capon can be grown on the same amount of eed and in the same time as an 8-pound cockerel. On the most undeveloped markets capons bring from three to six cents per pound more than cockerels, and when well established seldom sell for less than 18 to 25 cents per pound.

It is not only the greater weight and high selling price that makes capon raising attractive, but their sweet meat of fine flavor wins a place for them on every table.

HANDLE THE PULLETS

Handle the chicks, and market deformed birds as soon as they are of market size. Crooked backs, hip joints of unequal height, crooked toes, long beaks, combs with side springs, duck feet, off-colored eyes, and pronounced tendency to off-colored feathers cannot readily be detected without handling the birds. It is well to sew a band of red flannel or mark with colored paint the legs of birds destined for the early market. A dab of paint on the wing bow is also good. Let these birds run with the others till about the size needed, and then pen and fatten. Many a sale can be made at the door if the chicks are cooped and ready. Keep them free from lice and growing every day, but get rid of them quickly.

Too much attention cannot be given to the selection of cattle for breeding or feedig purposes.

BORDEAUX AND THE BLUESTONE QUESTION

(Continued from page 700)

and bitter rot, for it is well known that lime sulphur does not control these fungi nor even scab in a season when there is much moisture.

Why then is it that in spite of the fact that Bordeaux is acknowledged to be the best fungicide, and far superior to lime sulphur, that the latter has come into use? The answer is, plainly, because home-made Bordeaux is apt to cause severe damage.

If thousands of practical growers state that there is this danger in using home-made Bordeaux, I am willing to take their word for it.

It is proof enough that when they make home-made Bordeaux they do not know what they are getting, and it is for this reason only that so many have given up its use, for even if the results obtained by it and lime sulphur were the same, no one with a sense of smell or regard for himself and his team would use lime sulphur in preference.

Many Years of Experiments

Over sixt years ago we began the manufacture of paris green (and, by the way, you can get the formulas for making that, but I hate to think what would happed to your crop when you used it), and later of arsenate of lead.

Then, on account of the country-wide complaint about burning with home-made Bordeaux, we began the manufacture of arsenate of lead and Bordeaux combined.

Our chief chemist, who has been with us for about twenty years, with his assistants, began experiments that showed why the grower does not know what he is getting when he makes a similar preparation.

Guesswork, Poor Work

How many growers know that bluestone contains iron, sulphur, other impurities, and often free sulphuric acid, and that these ingredients vary in amount in different lots of bluestone?

Therefore when you are buying bluestone you are making your first guess, for what grower ever has it analyzed? Lime over 99 per cent pure should be used, but does the grower know whether the lime he gets is over 99 per cent pure?

One thing is known, and that is that if you leave home-made Bordeaux mixture standing it will turn black.

What would be said of Adheso if it did that?

Many who read this article are using Adheso orange label. Make some Bordeaux mixture and then mix up some Adheso orange label and let them stand, and see what happens. You certainly will know then that you are getting something you don't want whe you make Bordeaux mixture.

When you see the Bordeaux mixture turn black you will realize that a powerful chemical reaction is taking place, and know why, even though it is always sprayed when freshly made, it goes through chemical changes on the leaves and fruit that result in burning and russeting.

This then, as cheimsts, was our problem. To do in the manufacture of arsenate of lead and Bordeaux combined what we had previously done in making arsenate of lead. This was to produce a material that gave the beneficial effects desired without damage to foliage or fruit.

This was not the work of a day, but of years. We found that in buying bluestone there was much that we had to reject, and the same with lime, that even the purest raw materials we could buy had to be further purified. How we do this, and how we make our combinations, I naturally am not at liberty to say. One thing is certain: that we obtained after long experiments a material so pure and stable against reaction that it showed no such dangerous chemical changes either in the spray tank or on the foliage or fruit, as ordinary Bordeaux.

Although it was safe and far superior to ordinary Bordeaux chemically, yet its physical qualities were not so far advanced as its chemical.

It was not nearly as gritty as home-made Bordeaux and stayed in suspension in the spray tank much better, for homem-ade Bordeaux must be violently agitated. In addition, it only stuck a little better than Bordeaux.

We had thus far produced the purest chemical mixture known, and of superior physical qualities, but we felt before we could generally urge its use by the thousands of growers who were satisfied with our arsenate of lead that it should be made as nearly ideal as possible.

Adhesive Quality at Last

Ever since the discovery of Bordeaux mixture by Millardet, chemists here and abroad have endeavored to give it adhesive qualities. You will find in bulletins similar statements to "the value of a spray chemical depends upon its adhesion," and "if it had not been for rains which washed off the Bordeaux the results would have been far better."

In making experiments to secure greater adhesion, or sticking quality, I several years ago hit upon a way to produce the material so that it actually was not washed off by rains, and at the same time was of such a nature as not to interfere with the breathing of the leaves.

I further found methods of eliminating all grit, and in creating a covering quality and degree of suspension in the spray tank that is unknown in home-made Bordeaux.

It is during and immediately after rain that the chief fungous infestations take place. Therefore it is little wonder that Adheso gives infinitely better results than a material which is washed off and leaves the fruit and foliage open to the attacks of the fungi.

It is not the thickness of the coating of copper or amount of copper in a mixture that goes onto a leaf or fruit that counts, but the completeness of the coating. A thin, unbroken film of copper hydrate will afford absolute protection against the fungi, which is what Adheso does, whereas a heavy coating of copper that leaves many parts of the foliage unprotected and is almost entirely washed off by rain cannot give protection.

Prices Compared

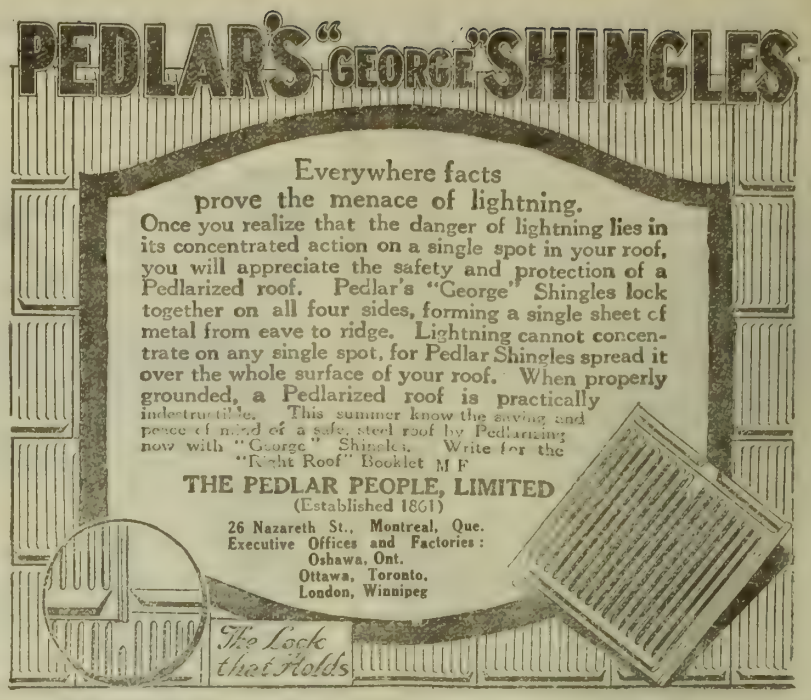
I think that there is no advice that has been given the grower that has done him so much damage as that in regard to what spray chemicals should cost him per pound, and how he can make them cheaper per pound himself. In giving figures of the cost of home-made materials one thing is almost always omitted, and that is the cost of labor. Surely the grower's time is worth something.

Ordinarily Adheso costs the grower about the same as home-made spray, but this year, due to the fact that we bought raw materials very early and have given the growers the advantage of it, the cost has been considerably less. It is foolish to figure what such materials cost per pound. The only way is to figure what they cost per spray tank.

A home-made preparation may only cost 10 cents per pound, but as you have to use over 13 pounds of it to 50 gallons, the cost per spray tank is over $1.30. Adheso orange label costs you 13 cents per pound, and 4 pounds of it are commonly used to 50 gallons, at a cost of 52 cents per 50 gallons of spray material.

I ask all growers who read this article to watch carefully the results obtained by Adheso this year and judge for themselves, unaffected by what anybody else may say, whether it or home-made Bordeaux gives the best results, not only in regard to burning or russeting, but also in regard to the amount of clean fruit produced.

A mistake often made is in being misled by a fancy for certain shapes, colors, and fashionable points, to the neglect of others relating immediately to the usefulness of the matured cow. Some men will have all their herd of one color, or must have particular markings in certain situations, and if a cow is of a certain roan tint they will forgive her being a bad milker and not worth her salt, or perhaps they never trouble to inquire, and do not know how worthless she is for the purpose for which she is supposed to be



PEDLAR'S "GEORGE" SHINGLES
Everywhere facts prove the menace of lightning.
Once you realize that the danger of lightning lies in its concentrated action on a single spot in your roof, you will appreciate the safety and protection of a Pedlarized roof. Pedlar's "George" Shingles lock together on all four sides, forming a single sheet of metal from eave to ridge. Lightning cannot concentrate on any single spot, for Pedlar Shingles spread it over the whole surface of your roof. When properly grounded, a Pedlarized roof is practically indestructible. This summer know the saving and peace of mind of a safe, steel roof by Pedlarizing now with "George" Shingles. Write for the "Right Roof" Booklet M F

A PROMINENT P. E. I. STOCK BREEDER LURED BY THE WEST

The name of Fred Clark, of Victoria, P. E. I., the prominent breeder and exhibitor of Holstein cattle, is a household word with readers of **The Maritime Farmer.** He and his neighbor, W. M. Lea, with whom he co-operated in breeding and exhibiting under the firm name of Lea & Clark, have been two of the most successful dairymen in the Maritime Provinces.

We are sorry to announce that Mr. Clark has sold his farm and has taken up his abode in Winnipeg, where he hopes to find a good market for his black and whites and a remunerative sale for milk and cream.

Fred's stock will be a good advertisement in the West for Maritime Province cows. He has already been asked to come East and purchase some 200 head of two-year-old heifers for a large ranch near Winnipeg. During the last month he has taken three carloads of cattle from Prince Edward Island, and as soon as the weather gets a little cooler the balance will be purchased and taken West.

So while we are sorry to lose Mr. Clark from our midst we feel that he will boost Eastern stock for all he is worth.

George Callbeck, of Summerside, who accompanied Mr. Clark with his shipment of cattle, on his return trip paid **The Maritime Farmer** a friendly call. George is a hustling, wide-awake, typical young Islander. While he liked the West pretty well, he says P. E. Island is good enough for him. Callbeck's Yorkshire Swine are becoming pretty well known not only in Canada but also over in the United States. Good judges of swine claim that the Callbeck strain of Yorkshires is second to none in Canada, and consequently the demand for their young stock exceeds the supply. We have heard one judge say that the Callbeck herd contains the most typical Yorkshire sow in all Canada. They have been offered fancy prices for her, but they have refused to part with her, as they consider she is worth more to them as a tried and true breeder than any monetary consideration they might be induced to accept in exchange.

THE N. B. F. & D. A. EXCURSION

As announced on another page of this issue, a mid-summer meeting of the New Brunswick Farmers' and Dairymen's Association will be held on the Experimental Farm, Fredericton, N. B., on August 23rd. Excursion parties are expected to come from all parts of the province. Buy a single-fare ticket for Fredericton, and when doing so do not fail to ask for a Standard Certificate. At Fredericton you will receive in exchange for this Standard Certificate, after it has been duly signed by the secretary of the New Brunswick Farmers' and Dairymen's Association, a free ticket for the return trip.

Take a day off with your wife and family, and spend a pleasant, profitable day at the Experimental Farm with your neighbors and fellow farmers from other sections of the province. You will have ample opportunity to inspect the splendid farm buildings, live stock, implements, and the methods followed in the field, garden, orchard, and dairy.

You will see ideals which it will be well worth your while to pattern after, and be assured that the closer you can follow them, or improve on them, the greater will be the profits from your operations.

Dinner will be served free on the farm to the excursionists.

Interesting addresses will be delivered by prominent agriculturists, and you will be free to ask as many questions as you like.

"Metallic" Ceilings

and wall plates make very handsome, easily cleaned, fire retarding [illegible]. Splendid for home, church, school, etc. Fit up one room and see how you like it.

TRIBUTE TO THE HORSE

"Here's to that bundle of sentient nerves, with the heart of a woman, the eye of a gazelle, the courage of a gladiator, the docility of a slave, the proud carriage of a king, and the blind obedience of a soldier; the companion of the desert plain, that turns the moist furrows in the spring in order that all the world may have abundant harvest, that furnishes the sport of kings, that with blazing eye and distended nostril fearlessly leads our greatest generals through carnage and renown, whose blood forms one of the ingredients that go to make the ink in which all history is written, and finally, in black trappings, pulls the proudest and the humblest of us to the newly sodded threshold of eternity."

GAS ENGINE DON'TS

Don't attempt to run an engine without providing sufficient lubrication.

Don't over-oil the engie. Just enough

Don't over-oil the engine. Just enough in the right place is better than a quart.

Dont' use common black oil on small bearings. Such oil is not suited to the purpose.

Don't screw a spark plug on too tight. It may "bake" fast. Graphite, if available, should be used on the thread.

Don't put gasoline into the tank without straining it through a chamois. There may be water in the gasoline, or some sediment that would clog up the carburetor or fuel pipe.

DRILL FOR LEATHER PUNCH

The ordinary automatic awl will be found a very useful article to take the place of a leather punch and to aid in punching holes in leather. As there is usually different sizes of teeth with the drill, different sized holes may be made. It will be found much easier to make a hole in thick leather such as traces, with this tool than the ordinary leather punch of the farmer, and will take the place of it when the punch may happen to be mislaid.

It never pays to use a cheap lantern. During recent years the desire for underselling has resulted in the sale of a alntern whose burner, instead of being securely screwed on the oil reservoir, is merely slipped on. As a consequence, if the lantern is upset the burner comes off and the oil is allowed to run out upon the lighted wick. The result is either an explosion or a serious blaze, and unless speedily checked damage to life and property. One part of the farm equipment that ought always to be safe is the lantern.

TAKE A DAY OFF
Between Haying and Harvesting

Visit the Experimental Farm Fredericton, N. B., on

Wednesday, August 23rd.

A Mid Summer Meeting of the N. B. Farmers' and Dairymen's Ass'n will be held there on that date

Experts will be on hand to talk on various branches of the work right in the open.

ORCHARD HILL FARM
Brown's Flats, N. B.

MAXIMUM PRICES FOR HAY AND STRAW FIXED

The following maximum prices, taken from a recent issue of the London Morning Post, have been fixed by the Army Council for hay, oat straw, and wheat straw of the 1916 crop in England and Wales:

Hay, 6£; oat straw, £3 10s.; wheat straw, £3 per ton, on the conditions that the Forage Department bale or truss and the vendor delivers to certain ports or troop centres. This will enable the vendor whose produce is close to the particular port or troop centre to obtain the advantage of proximity value. Where the vendor consigns his produce by rail he will not be charged with railway freight in excess of 10s. per ton.

In cases where the railway freight is 10s. per ton or more the prices actually received by the vendor will be £5 10s. per ton for hay, £3 per ton for oat straw, and £2 10s. per ton for wheat straw, on condition that he carts the produce to rail.

Where forage is not lifted until after December 31, 1916, the following additional payments will be made irrespective of the date of purchase:

Lifted druing January, 1917—2½ per cent of purchase price.

Lifted during February, 1917—5 per cent of purchase price.

Lifted during March, 1917—7½ per cent of purchase price.

Lifted during April and after—10 per cent of purchase price.

When desired, an advance of 50 per cent of the purchase price will be made within fourteen days of the purchase.

Interest at the rate of 5 per cent per annum will be paid from October 31, 1916, to the date when the final bill is sent for signature, upon all amounts remaining due upon the purchase.

All hay must be insured against fire by the vendor.

The maximum prices at which hay or straw of the 1916 crop shall be purchased from the producer by hay merchants and others shall not exceed £5 10s. per ton for hay, or £3 per ton for oat straw, or £2 10s. per ton for wheat straw (including delivery to rail by the vendor, but exclusive of the cost of baling or cutting and tying), and the maximum prices at which hay or straw shall be resold to the consumer, delivered onto his premises, shall not exceed £7 10s. per ton for hay, £4 10s. per ton for oat straw, and £4 per ton for wheat straw.

EXCURSION TO EXPERIMENTAL FARM

The New Brunswick Farmers' and Dairymen's Association will hold a monster agricultural excursion to the Experimental Farm in Fredericton on August 23rd, the executives of the association having reached that decision at a meeting held in Fredericton on July 26th in the provincial agricultural offices. Arrangements are now under way to have an excellent programme prepared. Hon. J. A. Murray, Minister of Agriculture, is to be one of the principal speakers, and experts from the experimental farm at Ottawa will discuss various agricultural problems.

The idea of this excursion was discussed at the last session of the Farmers' and Dairymen's Association, but it was then suggested that a two days' mid-summer meeting be held at the experimental farm between haying time and harvesting. Now, however, it has been decided to run the excursion and allow all farmers of the province to spend one entire day at the experimental farm.

President C. E. Fisher, of Chatham; H. H. Smith, of Hoyt Station; N. W. Eveleigh, of Sussex; A. R. Wetmore, of Clifton; and Superintendent W. W. Hubbard, of the experimental farm, attended the meeting.

Ontario Veterinary College

110 University Avenue, Toronto, Canada

Under the Control of the Department of Agriculture of Ontario.

Sydney, N. S.
October 3-6, 1916

IF YOU HAVE LIVE STOCK FOR SALE ADVERTISE IN THE MARI-

THE MARITIME FARMER

AND

CO-OPERATIVE DAIRYMAN

REGISTERED TRADE MARK

Official Organ of The Farmers' and Dairymen's Association of New Brunswick, The Nova Scotia Farmers' Association, The Nova Scotia, New Brunswick and P. E. Island Fruit Growers' Associations, The Maritime Stock Breeders' Association, The Maritime Bee-Keepers' Association and The Newfoundland Agricultural Board.

Volume 21. SUSSEX, NEW BRUNSWICK, AUGUST 29, 1916. Number 22.

Pure Bred Cow Will Give Greater Profit Than Grade

A Certain Element of Refinement Always Follows the Breeding and Rearing of Pure-Bred Live Stock.

A pure-bred cow is a cow that has sire and dam recorded, with number and pedigree, in the herd book of her particular breed. This cow is eligible upon payment of a small sum to have her name, those of her sire and dam, date of birth, the name and address of her breeder, placed in the herd book. When the name is entered in registry the cow is given a serial number which follows the name when written and a certificate of registration is issued her owner.

The term "thoroughbred" is frequently and erroneously used as synonymous with "pure-bred." Thoroughbred is a running horse. It is a specific name, just as Percheron, and its use in connection with any other breed of live stock is incorrect.

A grade cow is a cow which has fifty or more per cent of the blood of one breed. For example, the offspring of a pure-bred Holstein bull and a cow of mixed breeding.

A scrub cow is a cow of mixed breeding, no one blood predominating—that is, less than fifty per cent.

A high-grade cow is a cow resulting from several successive crosses. Starting with a scrub cow, after five successive pure-bred crosses the offspring would be thirty-one thirty-seconds pure and would be termed "high-grade." In some horse registration books such an animal is eligible to registry, but with cattle such is not the case. These high-grades, although practically the equivalent of pure-breds, lack the prepotency and the ability of the latter to transmit to their offspring uniformity of type and performance.

There are two chief sources of revenue from a herd of dairy cattle, writes M. R. Shafer, in Farmer's Review, namely, milk production and sale of cattle for breeding purposes. Of these two, the first is by far the more important, milk production being the ultimate use of all dairy cows. It is true that many breeders make very good profits rearing cattle to sell for breeding purposes alone, paying very little attention to the sale of the dairy produce of their herd. However, considering the large number of dairymen who supply the milk consumers of our large cities, the creameries, the condenseries and the ice cream factories, the cattle breeding industry is a mere drop in the bucket as compared to that of milk production.

The sphere of the grade dairy cow is confined to milk production. Her whole value is measured by her performance at the pail. With the pure-bred cow this is not true. Besides her value as a milk producer, this pure-bred cow is capable of producing a calf for which there is usually a ready market at a price four or more times as great as the price commanded by the calf from a grade cow of apparently equal quality.

In comparing pure-bred and grade dairy cows in regard to milk production many complications arise. On the average dairy farm the grade is by far the most popular cow. Yet we believe, and rightfully so, that the pure-bred is a larger and more economical producer than the grade. If this is not true, then all the toilsome years of striving toward the ideal are of no account. Surely the dairy animal, which represents the effort of the most careful breeders and students of breed selection, is on the average a better cow than the one that just happened and whose ancestors are unknown.

There are poor pure-breds as well as grades, and good grades as well as pure-breds. To determine the value of type, the Connecticut Station conducted an experiment, using two pure-bred Guernseys, one of the strict dairy type and the other of the "mongrel" type, and two grade cows of similar types. The good pure-bred cow returned a net profit of $22.17, while the poor pure-bred gave a profit of $1.86. The good grade cow produced 1,000 pounds of milk and 86 pounds of butter fat more in a year than did the poor type grade.

This same station conducted an experiment on pure-bred and grade dairy cows. Fourteen grades and eleven pure-breds were used. For the year the pure-breds averaged 5,811 pounds of milk against 5,522 pounds for the grades. Of the twenty-five cows, four were kept at a loss; three of these four were pure-breds. These experiments show that a pedigree is not a guarantee of dairy quality. The difference between pure-bred cows of the same breed is very great. A pedigree should be considered only as an assurance of pureness of breeding. The scales and Babcock tester, with accurate feed records, are the only proof of quality.

The New Jersey Station conducted a rather unique experiment to determine the effect of feed on amount of milk produced. Four cows were selected for this experiment. No. 1 and No. 2 were fed a good dairy ration, while No. 3 and No. 4 were fed a non-nutritive ration. At the end of thirty days the rations were reversed for the same length of time, No. 1 and No. 2 being fed the poor ration, and No. 3 and No. 4 being feed the good ration. Due to the change of feed, cow No. 1 decreased 11.2 pounds and cow No. 2 decreased 3.5 pounds of milk a day. Cow No. 3 gained 3.3 pounds and cow No. 4 increased 5 pounds of milk per day. The nutritive ration produced 687 pounds more milk and 31.47 pounds more butter fat than the poor ration. Data from this experiment shows that it is more profitable to keep twenty cows, feeding them a good dairy ration, than to keep twenty-five cows feeding them a poor ration. This evidence that feed is of first importance and that in order to get the most profitable returns from a dairy herd the most nutritive balanced rations must be fed.

The possibilities of grading up an average herd by the use of pure-bred sires are very great. No dairyman who keeps ten or more dairy cows, either pure-breds or grades, can afford to be without a good pure-bred bull at the head of his herd. No man should expect to succeed in up-grading a dairy herd by using a grade bull. The pure-bred sire has prepotency and the ability to transmit to his offspring the inborn tendency to milk and butter fat production. This the grade bull does not have, most assuredly not with so great a degree of uniformity as the pure-bred bull. A good bull must be able not only to get a few high producing daughters, but transmit his dairy tendencies to a large percentage of his offspring. Money spent for this kind of a bull is indeed well spent.

Unless backed up by considerable capital the man starting into the dairy business cannot afford to purchase all pure-bred animals. In most cases this would be unwise. The averafe beginner will find it more profitable to purchase a larger number of good grade cows than a few high-priced pure-bred ones. Buy a suitable number of good grade cows. The $100 cow is usually cheaper than the one that can be bought for $60. Put a good pure-bred sire at the head of this herd. Money spent for a bull is usually well spent, for he is at least one-half the herd. Do not be afraid to put considerable money in a good sire, but be sure that you buy from a reliable breeder. Buy one or two good pure-bred cows, preferably in calf by some good bull. Again do not be too economical, for these cows are the foundation of your herd to be. By keeping all heifer calves and by an occasional purchase the grade herd can be gradually transformed into an all pure-bred herd with a comparatively small outlay of capital. No dairyman should be satisfied with a grade herd, but do not rush it too rapidly. Use judgment.

The fundamental reason for keeping a dairy herd is the profit which it returns. A few are kept for pleasure, but these need not be considered. Since profit is the fundamental reason for dairy cattle, in choosing between a pure-bred and a grade herd it would be well to compare the profits returned by the average high grade and the average pure-bred cow. This is attempted in the following table:

Grade	
Capital invested $100.00	
Interest and depreciation 10 per cent	$10.00
Cost of feed 1 year	75.00
	$85.00
300 lbs. butter fat at 30 cts.	90.00
Profit	$5.00
Value of calf	25.00
Profit with calf	$30.00
Pure-bred	
Capital invested $250.00	
Interest and depreciation 10 per cent	$25.00
Cost of feed 1 year	75.00
	$100.00
300 lbs. butter fat at 30 cts.	90.00
Loss	$10.00
Value of calf	75.00
Profit with calf	$65.00

Note.—Labor was considered to be offset by the value of fertilizer produced in each case. Service of bull, which would be practically the same in each case, was not taken into account.

Here we have the whole question in a nutshell. Not considering the value of the calf, the profit of the grade cow is $5.00 per annum, while the pure-bred cow is kept at a loss of $10.00. Many dairymen who keep grade bulls realize no profit from their calves. Considering the grade calf to be worth $25.00 and the pure-bred to be worth $75.00 at six months of age, we have a profit on the grade cow of $30.00 per year and on the pure-bred cow a profit of $65.00 per year. The calf is the determining factor; without it dairy business would be a failure. Considering the ready market for young pure-bred stock, the pure-bred dairy business would be a failure. Considering the ready market for young pure-bred stock, the pure-bred cow is a more profitable investment than the grade cow.

In the show ring there is little comparison between the grades and pure-breds. The grade cow is not eligible to the ring in the larger shows, and if she were the competition of the well-bred registered cow would be too severe. The show ring is in reality a side issue to the breeding and rearing of pure-bred dairy cattle. The premiums are scarcely ever more than sufficient to defray the expenses of the exhibition. Pleasure and advertisement are the only returns of the show ring.

Profit is the fundamental reason for keeping a dairy herd. We have shown that the profit from a pure-bred cow is greater than that from a grade cow of

Importance of Road Maintenance and Repair

By Ralph G. Carter

There is no phase of the road problem more important than that of maintenance. The general impression that there are certain types of roads that are permanent is erroneous. No permanent road has ever been constructed, or ever will be, according to the road specialists. The only things about a road that may be considered permanent are the grading, culverts, and bridges. Roads constructed by the most skilful highway engineers will soon be destroyed by the traffic, frost, rain, and wind unless they are properly maintained. But the life of these roads may be prolonged by systematic maintenance. A poor road will not only be improved by proper maintenance, but may become better in time than a good road without it.

Keep Surface Well Drained

The first and last commandment in earth road maintenance is to keep the surface well drained. To insure good drainage the ditches should be kept open, all obstructions removed, and a smooth crown maintained. Except for very stony soil the road machine or scraper may be used very effectively for this work. The machine should be used once or twice a year, and the work should be done when the soil is damp, so that it will pack and bake into a hard crust. Wide and shallow side ditches should be maintained with sufficient fall and capacity to dispose of surface water. These ditches can in most places be constructed and repaired with a road machine.

Hard and Slow Work with Horses

Even under the most favorable conditions, work with a road machine or scraper is slow and difficult for horses, and under many conditions almost impossible; besides, so many horses are required to operate a grader that they are unwieldy in a narrow road and very difficult to manage. Then, too, in the spring of the year, when the work of the roads should be done, teams as well as men are at a premium, as the farmers are busy in the field and have no horses or men to spare.

Doing the Work at the Right Time

The all-important thing in road building and in maintaining good ones is getting onto the roads when the dirt is in just the right condition—doing the work a day or so late makes the work harder and less effective. With a tractor, roads can both be built and kept in excellent shape because of the fact that weather conditions can be immediately taken advantage of and the work completed before the roads become dry and hard.

All vegetable matter, such as sods and weeds, should be kept out of the road, as they make a spongy surface, which retains moisture. Clods are also objectionable, for they soon turn to dust or mud, and for that reason roads should never be worked when dry or hard. Bowlders or loose stones are equally objectionable if a smooth surface is to be secured.

Using the Drag to Advantage

A split-log drag or some similar device is very useful in maintaining the surface after suitable ditches and cross section have once been secured. This drag can also be used to advantage on a gravel road as well as on an earth road. The principle involved in dragging is that clays and most heavy soils will puddle when wet and set very hard when dry.

In dragging roads only a small amount of earth is moved, just enough to fill the ruts and depressions with a thin layer of plastic clay or earth which packs very hard so that the next rain instead of finding ruts, depressions, and clods in which to collect, runs off, leaving the surface but little affected.

The drag should be light and should be drawn over the road at an angle of about 45 degrees. One round trip, each trip straddling a wheel track, is usually sufficient to fill the ruts and smooth the surface. If necessary the road should be dragged after every bad spell of weather when the soil is in proper condition to puddle well and still not adhere to the drag. If the road is very bad it may be dragged when very wet and again when it begins to dry out. A few trips over the road will give the operator an idea as to the best time to drag. Drag at all seasons, but do not drag a dry road.

The slope or crown of an earth road should be 1 inch to the foot. If the crown becomes too high it may be reduced by dragging toward the ditch instead of from it. If the drag cuts too much shorten the hitch and change your position on the drag. If it is necessary to protect the face of the drag with a strip of iron it should be placed flush with the edge of the drag and not projecting. A culling edge should be avoided, as the main object in dragging is to smear the damp soil into position.

Notwithstanding the fact that road drags have been widely used, there are very few reliable data available which relate to the cost of drag maintenance. Furthermore, most of the data which have been collected are difficult to interpret, because of the fact that they do not usually furnish sufficient information concerning the character of the surface maintained or the prevailing climatic and traffic conditions to warrant any very general deductions. Sufficient is known, however, to warrant the unqualified statement that no cheaper method than dragging has ever been devised for maintaining the types of roads for which the drag is adapted.

The cost of constructing a satisfactory road drag varies from about $2, when a plit-log drag is used and all materials are conveniently available, to perhaps $10 or $12 when the drag is made of first-class sawed lumber, neatly finished in every detail, and painted. This item of first cost appears almost insignificant when it is considered that the life of a well-constructed road drag should be at least three or four years.

The cost of operating a drag varies, of course, with the cost of labor and power. Accurate data has showed that under favorable conditions a road could be dragged at the rate of about one mile per hour. This was where the road was comparatively well shaped and only one trip in each direction was necessary. Where more trips of the drag were required the rate was, of course, correspondingly diminished.

The Draft of Plows--

By Prof. J. Macgregor Smith

University of Saskatchewan, Saskatoon

Do you know how much power it takes to pull your plow, or any other farm implement, for that matter? In any manufacturing plant careful records are kept of the amount and cost of the power required to run the machinery. This cost is very closely watched so that the work is done as ecnomical as possible, thus keeping operating expenses at a minimum. Why should not farmers keep the same careful check on operating expenses? If it pays manufacturers it will pay farmers, who are also manufacturers. As outlined in this article, municipalities could profitably invest in a dynamometer to be used at the plowing matches which ought to be held in every locality. Every pound saved in draft is as good as a pound earned, and all reasonable economy is the duty of every true citizen.

The plow having been brought to its present standard of perfection, we find ourselves, not so much perhaps from humane motives as from a sense of financial loss through wasted powers, studying this interesting topic: the draft of plows.

The tota draft will be influenced by numerous factors, including shape of moldboard; condition of plow, sharpness of shares and scouring qualities; various adjustments; character and condition of the soil; presence of various attachments, coulters, gauge wheels, etc.; size of furrow; weight of plow and angle of the line of draft.

According to Sanborn, "the plow shows the lightest draft when set to cut the widest furrow of which it is normally capable." This is probably accounted for by the remarkable results of an experiment at the Utica trials, which showed that 55 per cent of the draft of the plow was caused by the cutting of the furrow slice, 35 per cent by friction of the sole, and only 10 per cent by the work of lifting and turning the furrow. The average draft of a number of plows running in the empty furrow was 168 lbs. The whole draft was 476 lbs., and the draft with the moldboard removed 434 lbs. The difference between 168 lbs. and 434 lbs. was taken to be the draft required for cutting the furrow slice. Sanborn states later that 42 per cent of the draft is used by the share and landslide, and another writer puts the moldboard friction at only 2 per cent. These figures will not hold for all conditions, but even an approximate idea of the division of draft explains many frequently observed facts.

Small Cutting Edge

In relation to the size of the furrow the cutting edge should be as small as possible. A furrow 4x12 inches has a line 16 inches long which must be cut, and an area of cross section of 48 square inches, a proportion of 1 to 3. One 6x14 inches has a cut surface of 20 inches and an area of 84 square inches, a ratio of 1 to 4.2. The larger the furrow cut, therefore, the less the influence of the cutting edges on each square inch of cross-sectional area, which is a commonly accepted unit of comparison. Sanborn found a constant decrease in draft per square inch as the furrow was deepened and widened up to the normal capacity of the plow. When made to cut wider, narrower, shallower, or deeper than the adjustments of the plow ordinarily permitted there was an increase in draft of 15 to 20 per cent, much harder work for the plowman, and a poorer quality of plowing.

Long Hitch or Short Hitch?

"Does a plow with a long beam pull harder than one with a short beam? I have heard it claimed that it does."

On the contrary, a long hitch to a plow will make it pull some easier than a short hitch. A plow is different in this respect from a log or a wagon. Here a short hitch causes the horse's tugs to have a lifting effect on the load, which tends to keep it from digging into the ground, which helps to lighten the pull. But when the horses' tugs pull on the beam of a plow it tends to lift the plow out of the ground and something must overcome this lifting or the plow will not stay in the ground.

If the "suck" of the plow nose is not strong enough to overcome this lifting action of the tugs, then you must set the beam clevice or lift on the handles enough to overcome it. This is setting one force to overcome another, and that always means lost energy.

Tests made at one of the agricultural experiment stations showed that hitching a nine and a half foot chain between the end of the plow beam and the evener made a saving of 6 per cent in the draft of a fourteen-inch walking plow, while a thirteen and a half foot chain made a saving of 8 per cent in the pull. You see, when you increase the length of the hitch you decrease the lifting action of the tugs, and so reduce this energy that is lost in overcoming that lifting action. The line of pull from the point of the horses' shoulders to the center of the load of the plow should be as nearly parallel with the bottom of the furrow as is practicable.

The power absorbed in severing the furrow slice demands that shares be not only sharp but properly sharpened. Sanborn reports a difference of only 6.7 per cent in favor of an old point resharpened over a dull point on the same plow, but an advantage of 36 per cent in favor of a new point over the old point resharpened. At all events, farmers should not waste power on dull shares. The Winnipeg motor contests have shown a difference of almost 50 per cent in the draft of different makes of plows plowing the same depth and width of furrow in the same land. Is this not worth consideration? But to get to the point in a practical way: How much does it take to pull your plow—400 lbs. or 2,000 lbs.? If this question were asked at a meeting of practical men, answers would be given covering even a wider range than the figures suggested above.

Test the Draft of Plows

There is no better incentive to better farm practice than an active interest in plowing matches. There is a splendid opportunity afforded at such a gathering to demonstrate some important factors in the operation of our most important implement—the plow. When a man is between the handles of a walking plow he carefully adjusts it to work as easily as possible; but he sometimes forgets when he is sitting on a bag of hay on a sulky, and his horses suffer. If too little power is supplied the teams lose in condition, or, worse still, the quality of the work done is lowered.

A municipality might very profitably purchase a dynamometer (it is simply a strong spring balance) and loan it to any man at a nominal fee. This is not an extraordinary proposal, and the writer has had this suggestion made to him by several farmers. If this is not possible, arrangements should be made to have the agricultural colleges supply demonstrators to test the plows right in the field. Seeing is believing, and one practical dem-

N. B. Farmers Enjoy Field Day at Provincial Experimental Farm.

President George E. Fisher and the other officers associated with him in the management of the New Brunswick Farmers' and Dairymen's Association conceived the idea that it would be a good plan for the association to conduct farmers' excursions from various parts of the province to the Experimental Farm at Fredericton. Arrangements were made for the excursionists to meet on the same day at the Experimental Farm and there view the transformations that are taking place to make what is destined to be one of the finest experimental farms in the Dominion. There they could see crops grown under the most modern methods, and although perhaps each and every farmer in the assemblage may not be able to do things just as they are done at Fredericton, yet the ideals are there, and it is well for everybody to strive for the highest possible ideals. It may take some time to get there, but "every time a little," the good old farmer's motto, is sure to bring success.

The attendance on the 23rd inst., when the excursion was held, was just about twice as large as was anticipated. Over 1200 farmers, their wives, and children came and enjoyed the outing. Old friends were met and new ones made. The Farmer representative saw many of our readers while there. It was interesting to note the conversations carried on by small groups as they wandered hither and thither to the various points of interest about the farm and compared experiences.

After the inspection of buildings and field crops, W. W. Hubbard and his efficient staff saw that the wants of the inner man were satisfied with a good substantial dinner, which was no small task, and for which they deserve every credit.

After dinner was served President Fisher addressed the audience. He told them what the New Brunswick Farmers' and Dairymen's Association's aims and objects were, and referred to the officers' wish to see the membership list recruited to fully 1000 strong for next year.

W. W. Hubbard spoke of the work that is being accomplished at the Experimental Farm, and the real value it should, and will, be to the farmers of the province when schemes now under contemplation are carried out.

Mr. J. H. Grisdale. Director of Dominion Experimental Farms, outlined the work of the various farms and stations under his supervision. He urged the farmers to keep in touch with the work that is being accomplished. Large sums of money are spent each year on the development of these farms and the testing, trying, and proving of cultural methods and comparative yielding value of various varieties of seed, all with the main object that the farmers of Canada may be informed at the minimum cost to themselves of the most up to date and profitable methods to adopt in their occupation.

Prof. E. S. Archibald, Dominion Animal Husbandman, gave an excellent demonstration in live stock, using the stock on the farm as illustrations.

Mr. G. C. Cunningham, Provincial Plant Pathologist, gave an excellent address on potato diseases, which was very much appreciated. The subject of combating and controlling potato diseases is receiving a great deal of attention, and it behooves potato growers to heed well the warnings and information sounded and distributed by Prof. Cunningham and the various experimental farm reports, bulletins, and pamphlets.

We believe the success attending this initial attempt to hold a farmers' field day at the Experimental Farm warrants the institution of such a day as an annual event.

Selecting Bull to Head a Herd no Easy Matter

If the expression so often made use of by breeders of pure-bred animals—that "the sire is one-half of the herd"—is true, and I believe that it is, the importance of selecting that sire must impress itself forcibly on the prospective buyer. Many mistakes have been made in these selections in the past, and without doubt many more will be made in the future, not alone by the beginner in the breeding of pure-bred stock, but by those who have devoted the greater part of their lives to trying to produce something better.

Where the purchase of a pure-bred sire means placing him at the head of an established herd of pure-bred matrons, should a mistake be made it is impossible to estimate the loss which the purchaser must sustain. No breeder of pure-bred animals would be short sighted enough to continue to keep at the head of his herd an animal whose offspring proved to be below the standard which he has been for years striving to attain. To do so would be suicidal to his own best interests, not only financially, but to his reputation as a breeder and judge of the stock he is producing. The financial loss would be far more easily recovered than the loss of confidence his customers would have in him were he to continue in service a sire whose offspring proved faulty.

The experienced breeder of pure-bred stock needs no instruction in the matter of selecting a sire. He is quite familiar with blood lines, should be a competent judge of individuality, and knows the weak points in his herd which he is striving to strengthen. To this it is an added fact that he has an acquaintance with other breeders which is valuable to him at a time when the new sire is needed. Possibly he knows teh individuals in other pure-bred herds almost as well as his own, and often watches the development of one or more young things in other herds up to a time when he is fully satisfied that all he has to do is to make the purchase, having fortified himself against possible mistake as fully as it is possible to do. In a case of this kind it is no fault of either the producer or purchaser if the sire does not fill all hoped for requirements, and it is simply a matter of not "nicking," that mysterious something which makes a sire a failure in one herd and a splendid success in another.

To the Inexperienced

With the novice or new beginner the situation, however, is entirely different unless he has been so situated that he has had ample opportunity to become familiar, not alone with the breeding of pure-bred stock, but with the feeding as well. He is quite liable to make a mistake in the selection of his first pure-bred sire. The possibility of making this mistake will, however, be greatly lessened if he is fortunate enough to make his initial purchase from a breeder who will conscientiously try to sell him what he should have rather than what he (the beginner) might wish to buy, owing to more pleasing appearance caused by higher condition, or special fitting for show purposes, color, etc.

I have felt for years that the breeders of certain classes of pure-bred stock, principally the beef breeds of cattle and different breeds of heavy horses, have not always acted toward their customers in a manner that was best for either in the matter of preparing their young sires for sale. Not all breeders are guilty, but many are, of the practice of forcing the young things to a point where it cannot but impair their future usefulness. You may say that every one is familiar with the fact that nurse cows and forced feeding are practiced, and should protect themselves in buying. I have attended the leading fairs for many years, and have never failed to find the nurse cows in evidence, or to have heard not onyl few, but many, ask why such thin or poor cows were at a fair, not knowing that many of the young things up to twelve and fourteen months old, which they so greatly admired, were indebted to these thin cows for much of their attractiveness.

Relative to the colts, and even older horses among the draft breeds, how many back on the farm know that muc hof the fat and attractiveness of young stallions they see at our fairs is produced by feeding four times a day—not simply the hay and oats with which they are quite familiar, but in addition to this syrup, flaxseed meal, alfalfa meal, sugar beets, carrots, boiled barley, and in fact anything which will produce fat and growth; this feeding will produce attractiveness, but not usefulness.

To the beginner I would say: Do not attempt to buy the overfat sire; rather select the sire with symmetry of form, attractive enough while thin to be pleasing. If possible, see both sire and dam of the young sire you are contemplating purchasing, and if possible to do so see the ancestors even farther back than sire and dam. If these are pleasing to you there can hardly be a dwoubt of the fact that his offspring will also be satisfactory. Buy from reputable breeders and dealers. Tell them as nearly as you can of what you are in need to improve your herd. Buy only young animals which will with care improve in your hands. If your breeding animals are light boned and perhaps undersized buy increased bone and size in your sire. On the other hand, if your females are inclined toward coarseness, buy more refinement in your sire. remembering always that masculine character must present itself in the successful sire.

Spend a week or two visiting the breeders and their herds. You will find in the years to follow that the time was well spent, and the breeders will be found only too willing to answer all questions which are of mutual benefit and from which the prospective purchaser will glean much valuable knowledge.—F R. Shaw, in Ottawa Valley Journal.

Oat Hay a Fine Dairy Feed

For years I have made it a practice to remove the oats from the field about the time the grain is passing from the "milk" to the "dough" stage of growth, using the crop for hay.

This usually can be done in early July. If the oats are left to stand longer there will be more grain, but the feed value—the palatable succulence of the stems and blades—will have been forfeited during the ripening process; there will be very little real nourishment contained in the product.

In curing this oat hay one must remember that, while the curing is very necessary, it is easily carried to extremes, in which case the greenness of the growth renders it peculiarly susceptible to the "cooking" action of the sun, and a great amount of the best part of the feed will be absorbed, while the product will be brittle and difficult to handle in stacking or mowing away.

A little practice will enable one to tell when the oat hay has cured sufficiently. It should not be quite as dry as ordinary meadow hay when raked. I rake it into wind-rows as soon as it cures, and put it into shock as quickly as possible. Sweep-rake harvesting, either from the swath or wind-row, is not advisable, as so much of it will overcure in this case.

Oat hay will keep well in outdoor stacks, but they ought to have a top of slough grass or other coarse meadow grass, to start the water off. I have realized best results, however, by storing it away in the hay mow. Of course, one can have the oats bound, and they will be fine to handle in feeding out during the winter months, but one must be careful not to get the sheaves too large or bound too tightly, which might induce mold.

I have found oat hay a splendid dairy feed, the milky consistency which is stored away in the grain being especially conducive to a heavy milk flow. It requires very little other grain or mill feeds in conjunction with it. For horses and stock cattle, and especially for sheep, it is excellent, no grain whatever being required with it. It is particularly adapted to raising young stock—calves, colts, and lambs—the elements contained in it being most conducive to the promotion of bone and muscle growth.

As soon as the oats are removed from the field I re-stir or thoroughly disc the ground. I may add that I have been delayed in doing this as late as July 29th, and the plan worked at that period. On this slightly rough surface, without harrowing, I sow some sort of seed for producing another crop. This is let stand till fall, when it is mown for hay, or if it seems rather late for it to make hay I utilize it for pasture. In either case it proves a valuabe crop, and it will not drain the soil of any more vitality than the growth of weeds which usually springs up after harvest and infests oat fields.

The first season I ever tried this plan I sowed the oat stubble to a mixture of oats, millet, and corn (two pecks of millet seed, a peck of oats, and a half peck of corn to the acre).

This made a growth as high as one's waist, and made some fine roughage for winter feeding. I used it along with the oat hay which had been removed from the land. Since that I have tried various mixtures for this second cropping. The last one I employed consisted of about two pecks of millet, about the same amount of cane seed, and a peck of corn to the acre. This made a wonderful growth, and I utilized it as late fall and winter pasture, although it was rank and tall enough to be mown for roughage. Other mixtures will suggest themselves to dairymen, the nature of these depending on various soil conditions, climatic influences, location, etc. I also have handled wheat stubble successfully in this manner, re-seeding it as late as mid-August, although there is considerable risk attached to seeding at this late date.—M. Coverdell.

WHAT THE SOW THISTLE IS LIKE

There are still thousands of farmers who cannot identify the perennial sow thistle on sight. Especially is this true in the areas where it is not generally distributed, and, as prevention is better than cure, and recognition of the plant when it first appears on a farm is the secret of easy combat, the Manitoba Department of Agriculture sends out this intimate word description, by which any farmer may identify this exceedingly dangerous weed. There is no other plant growing that will answer this description in all its details, and we suggest that every farmer who does not know the weed should paste this description on his granary door or somewhere else where he can refer to it.

Roots.—This plant produces a system of brown root stocks running horizontally through the soil from two to six inches below the surface. A few fibrous roots grow from these root stocks, but their main function is to act as storehouses of plant food and to aid in propagation. On these root stocks buds are produced, and from these upright shoots of a whiter color are sent to form new plants. From the upright root a great mass of fibrous roots are thrown out, and it is largely through these that the plant feeds. When undisturbed the roots will form a very dense mass and the plants will come up very thickly. The roots and all other parts of the plant are filled with a milky sap.

Leaves.—At its first appearance above ground the plant produces a rosette of leaves quite similar in general appearance to that of the dandelion, the leaves being much the same shape. The leaves are of a light green color, rather soft, have a heavy midrib, and are very distinctly veined. In the rosette stage the greatest width of the leaf is about one-quarter way back from the tip. An unvarying characteristic that helps greatly in identification is that in all stages the leaves have a continuous fringe of spines or "prickles." These spines are about one-sixteenth inch long and are set one-eighth to one-sixteenth inch apart. They are very regular as to size. After two or three weeks in the rosette stage the plant produces an upright stalk, and the leaves borne higher up from its sides are somewhat differently shaped and larger. On a strong plant these stem leaves are from six to twelve inches long close to the ground but quite small toward the top of the plant. Each leaf clasps the stem tightly, having no leaf steam or petiole, as in the case of, say, a popular leaf. These stem leaves lose the regularity of outline and are usually deeply cut with divisions directed backward. They still preserve the fringe of spines.

Stems and Branches.—The stems are of a lighter green than the leaves, usually devoid of noticeable hairs or spines, of rather soft character, and hollow. The plants grow from one to five feet tall. Side branches are shot out from the angles at the base of the leaves, and the plant becomes considerably branched, especially if given plenty of room.

Buds and Flowers.—When about one-third developed the flower bud is much the shape of a binder twine ball. Then it lengthens. The flower is very similar in appearance to the dandelion, but rather larger and a faint shade darker. They are so much alike, however, as to be undistinguishable except to an expert. They open in the morning and close at night. The outside row of petals have very fine serrations at the tip. The bloom first appears about July 4th, and the buds continue to open for several weeks. In most cases after the first flower has bloomed there is a series of flowers produced on surrounding stems, and these latter grow longer than the earliest flower stems.

Seeds.—The seeds are about one-sixteenth inch long, dark reddish brown, oblong and ridged lengthwies. At the top is a tuft of white silky hairs, which spread in drying and cause the seed to float in the air long distances.

SOUND ADVICE

Professor W. R. Reek points out to us that dairying is the great agricultural industry of Prince Edward Island and will always remain so, but one of the drawbacks, according to Mr. Andrew McRae, is the lack of good cows. There are too few that give 6000 lbs. of milk or over, and the great majority give around 3000 lbs. per year, or in many cases less. Good cows are always in demand. The western provinces are gradually adding to their live stock by recruiting among the herds of the eastern provinces; they are willing to pay a long price to get a high-class cow. The transportation charges are no more on a good cow than on a poor one. A word of warning is necessary. If we are to remain a dairy province, and if we are to advance in this work as we should, great care must be exercised in the selling of cows or heifers. Too often large prices induce sales which would never be made if serious consideration were given to the subsequent effect upon the personnel of the herd. Keep the best cows for breeders unless a surplus of high producers is on hand. A foundation herd of cows that have been tried and tested should never be parted with except when an equally good, or better, individual can be put in the place of every one sold.

An export trade in cows is an excellent asset, says Prof. Reek, if we are prepared to meet it properly. To do so we should have a surplus of good cows to offer and reserve foundations which will give good crops of calves next year and the year after. The offering of poor cows and the shipping of such to other parts give the Island no credit, but will ultimately cause her to be a point of supply when cattle in other districts are not available. When the demand is growing is the time to reconstruct our systems of breeding in order that only high-class progeny will be produced. The great secret leading to unusual success in Prince Edward Island at the present time lies in the selection of the sires to be used. Scrub bulls are dear at any price, and the returns from money invested in pure-bred animals will always warrant the expenditure. By careful selection, by careful rearing, by attention to the older stock, and by testing for milking qualities through the use of the scales will the dairy cattle be gradually raised in all parts to a high standard of efficiency.

There is no reason why Prince Edward Island should not become one of the great producers of pure-bred dairy animals in America, attracting buyers from every Province and State where a demand arises. The natural advantages, especially for the combatting of disease, are greater than in many parts. The securing of such a trade lies altogether in the ability to offer well-bred, high-producing cows, heifers, and bulls. Every indication points toward a scarcity of good stock, and now is the time to prepare for the brisk demands of the future. Do not sell the best cows or heifers, but build up the herds by breeding only the best bulls, and in a few years there will be large numbers of stock for sale that wil return very remunerative prices. Build for the future rather than for the present.

However, such cattle should not be raised for export purposes only. Our dairy production is not nearly so large as it might be, and until near the maximum our first aim must be the building up or the transforming of our industry until second to none, either in the production of cattle or the production of butter and cheese.

"Quantity is the measure of power if the quality is good, but in this case quality is the keynote to success," adds Prof. Reek.

Renfrew Machinery Salesmen Find Business in the Maritime Provinces Better Than Ever

Among recent visitors to Sussex was Mr. F. D. Vickers, general manager of the Refrew Machine Company, makers of the Standard line separators, scales, and engines. Mr. Vickers met the Maritime Province sales staff here and held a conference in regard to the general policy of the company.

Besides Mr. Vickers there were present E. H. Vickers, Sussex; W. A. Jeffries, Sussex; J. A. Beckwith, Nova Scotia; T. McMaster, North Shore; and C. G. Howard, Prince Edward Island.

The reports of the business for 1916 showed that more Standard lines have bee nsold in six months of the present year than during all 1915. The whole selling policy of the company was discussed, and plans were made for the next six months. The stories told by representatives tallied in one regard: sales have never been easier to close among the farmers, and settlements have never been more satisfactory. The company is adding another line to its list—a thirty-pound household scale, and there is already a large demand for it.

Mr. F. D. Vickers was delighted with his visit, and more delighted with the efforts of his eastern staff, who are putting Standard goods on the map.

ACTION OF PLANT FOODS

A subscriber in Pictou County, N. S., wishes to know the part played by the plant foods—nitrogen, phosphoric acid, and potash—in the growth of the plant.

In considering the part played by the plant foods—nitrogen, phosphoric acid, and potash—in the growth of the plant, it must be kept in mind that the effect of any element is largely dependent on the other elements necessary to plant growth being present in normal amounts, that all the elements, working together, are essential to maximum crop production, and thateven when these are present the results obtained by their use are often very materially affected by cultural and climatic conditions.

It is generally conceded that:—

Nitrogen exerts its greatest influence on the amount of foliage, the flowering process, maturing, color, growth, quality, and disease-resisting power of the plant.

If insufficient available nitrogen is present there will be a lack of foliage, stalks or stems will be short, leaves or blades small, color yellowish, weight of foliage, straw, and grain or fruit less than when required amount of nitrogen is available.

If excessive amounts of nitrogen are used the growth of foliage will be out of proportion to the grain or fruit, the growth, development, and maturity of the crop retarded, a tendency to softness of the tissues and apparently less power to resist attacks of fungus diseases.

Potash is apparently essential to the formation and transference of starch and other carbohydrates, has an important part in the development of eaves and woody parts of stems, stiffens the stem, stalk, and straw, assists in the development of the fleshy parts of the fruits, and makes the plants more resistant to the attacks of fungus diseases.

Lack of potash results in weak plants, while excessive amounts delay the maturing of the crop.

Phosphoric acid in available form favors rapid development of the young plant, hastens maturity, increases the proportion of grain to straw, assists in developing the grain, and is necessary to the development of protopeasm, without which there could be no plant growth.

DON'T USE WOODLOT FOR A PASTURE

Stock is usually permitted to graze in woodlots. What is the effect of grazing on the welfare of the woodlot? In open woodlots grazing removes the grass and weeds which otherwise might wither and become inflammable and a fire menace. The sod may be sufficiently broken by the hoofs of animals to permit tree seed to germinate in the mineral soil and thicken the stand of trees. A woodlot, however, should be so dense that little or no forage can grow in its shade.

On the other hand, heavy grazing has a deleterious influence on a woodlot, because stock will trample young seedlings, pack the ground around the trees, adversely influencing the permeability of the soil to water and air, and occasionally certain classes of stock, especially goats, and to a less extent sheep, will bite off seedlings.

Salting stock under trees usually will cause the trees to die, as many cattlemen are aware.

An occasional light grazing of a woodlot may result in but little injury to the woodlot and afford considerable advantage, but heavy grazing is to be condemned.

PREPARING APPLES FOR COLD STORAGE

It will bear reiterating that apples for cold torage should be picked when fully grown, but while still firm and yet well colored. They should be placed in cold storage promptly and all unnecessary delay in grading and packing should be avoided. Storing direct from the orchards without grading, and grading at leisure is good practice. For long period storage only the best fruit should be selected, and it should be free from disease or blemish of any sort. If the fruit is immature or of poor quality it will naturally wilt and decay more readily. If overripe it will dry out and evaporate and become what is known as "mealy." Overgrown fruit is not desirable for storage, as it lacks firmness. Medium-sized, well-colored fruit is the best.

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mask

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

CASH VERSUS CREDIT

That inequality and inefficiency strongly characterize the credit or "tick" system as conducted at present by practically all our country merchants should need no special corroboration in the minds of either the consumer or merchant himself. The facts are it is not real credit at all.

The merchant is not responsible for this, though he could do a great deal to improve it. He does too much to encourage it. Why should a cash purchaser pay for the credit of all debtors who buy on credit? A system which calls for a given price for an article paid for one year after sale and the same price for that article at the time of sale is essentially wrong. The conditions prevailing in one transaction should not govern another under entirely dissimilar circumstances.

There seem to be too many farmers at present to whom credit is an absolute necessity at some time of the year to render possible the total elimination of the present system. A liberal and real discount for cash, however, should be made. Prices might be fixed on 30 or 60 days' credit, with increasing charges thereafter. Some definite settlement plan ought to be adopted—say, 30 days. At that time if the customer does not pay in cash he might make a definite settlement with acceptable notes. Definiteness of policy on the part of the merchant, and backbone to live up to it, are necessary. The concensus of opinion among farmers seems to be against the present system, and though some will always be willing to make unnecessary purchases because credit is available, most farmers are shrewd enough to take advantage of discounts. "In so far as the mail order houses have increased the cash payment habit of mind, they have performed an economic service to both the consumer and the retailer," says a well-informed writer. If the farmer, instead of being a suppliant before the local merchant, could institute credit with his banker and pay cash to the retailer, who would pay cash to the wholesaler or manufacturer, who would manufacture for cash, several exorbitant and duplicate "credit profits" could be eliminated. The objection that credit cannot safely be extended to the farmers is scarcely a tenable one. He gets it now, and pays well for it, too. To stand this giant "system" on its feet instead of its head is not easy, but then we might be able to make it of some real service instead of a burden.

Under such a system many jobbers and wholesalers would have to do something more to justify their existence than they do at present. The army of drummers that marches up and down the country would have its ranks decidedly thinned. The retailer is not altogether responsible for the high prices. Though we are "over-stored" it is doubtful if the elimination of a number would leave more than a good living margin for the remainder. The retailers' recent move for consolidation and direct buying from the manufacturer shows his conclusion in the matter, and is one of the first fruits of mail order competition. The issuing of a special catalog by retail merchants shows they are alive. The present truck system of three "ticks" or credits—manufacturer to consumer—is making too much of a broncho of the farmer and mail order houses are helping lift the burden.—Grain Growers' Guide.

THE BACKBONE OF N. S.

The following editorial appeared in a recent issue of the Morning Chronicle, Halifax, N. S.:

"Agriculture—the backbone of Nova Scotia." How often have we all glibly repeated that statement! And how much have any of us done to justify that statement by our deeds? However, the fact remains: Agriculture is the backbone of our industrial life in this Province. It is the sure foundation upon which our Provincial prosperity is based—and it is progressing.

Progress along any line of human endeavor is led by the enthusiast. Always the enthusiast must be in advance of the needs of the occasion. Just so far will people be prodded along by the enthusiast and always a little short of the ideals he sets will they fall. The enthusiast is a very necessary and vital factor in the upbuilding of our national life just as he is in our business or home life.

Nova Scotia is fortunate in having many enthusiasts pointing the way to progress along the various pathways of endeavor open to our people. Agriculture, the noble vocation, has its enthusiast in Melville Cumming, and a worthy son of Nova Scotia he is. The Morning Chronicle has been indebted to Principal Cumming on each recurring New Year's Day for illuminating articles on our basic industry. We esteem his pleasant prods to greater effort and wish him well in his worthy endeavor to increase the output and value of our agricultural products.

We are exceedingly pleased to congratulate Principal Cumming upon the splendid showing he has been able to make for the creamery industry of this Province. A thirty-four per cent increase in the value of this industry following a three hundred and sixty per cent increase in the preceling year period is indeed a magnificent showing. From ten to fifty per cent more profit for the farmer on his dairy produce as a result of the general improvement in dairying is well worth while. Sixteen million dollars worth of dairy and animal products raised in Nova Scotia in 1915 constitutes a gratifying record. These facts stand out in Principal Cumming's report and fully justify the government's policy in respect to agriculture.

"Nova Scotia another Denmark," has been the guiding light of the government's agricultural policy. It is a sound policy and we are entering upon its full realization. The farm—a factory from which nothing is taken but the finished product—is a sound and sane ideal to set. The finished product is dairy produce and animal products. Let the enthusiast lead the way; the farmer of Nova Scotia has struck his gait and it content to follow. He will make it twenty-five million dollars worth of dairy produce and animal products within the next few years.

COMING EAST

A rancher living on the line of the Pacific Great Eastern in British Columbia has written to the St. John Board of Trade for information respecting farms on the St. John River and the cost of railway carriage for his family and stock. He says he is coming East in the spring to take up a farm here. It is such instances as these that indicate the growing interest that is being awakened in New Brunswick farm lands, and the growing appreciation of the farming opportunities which this Province contains. For mixed farming, dairying, and stock raising New Brunswick is not excelled by any other Province in the Dominion, while rural life here has little of the dreary monotony which affects so many of the newer localities in the west.

UPWARD TREND OF MACHINERY PRICES

Farmers who intend purchasing machinery this season are well advised to buy or arrange for its purchase as early as possible. The probabilities are that manufacturers will be obliged to increase their selling price before the season is far advanced. The price of iron and steel are now at a high mark, and, in fact, everything that goes into the making of machinery is high in price, with no prospect of being reduced in the immediate future. It is not necessary to discuss at length the reasons or causes for this condition. It is simply one of the many reactions of the war.

* * *

Make a study of feeding and caring for the animals. A herd will not develop itself. It takes study, persistence, brains, and ingenuity—and not a little experimenting. And the dairyman must choose carefully the sire for his herd and the cows he keeps for milkers. The records and pedigrees must, of course, be given the proper attention.

* * *

It's the indivilual that counts, not the breed as a whole. Make every individual measure up to the scales and the Babcock test, and you may develop the proper individual from any one of a number of breeds.

* * *

One man can, and does, make more profit from a forty-acre farm than another man can from an eighty. A difference in the farms, you say? Yes, and usually a decided difference in the owners.

* * *

The best way to get a profit-producing dairy herd is to use only good, pure-bred sires, take good care of the cows, and keep the calves "coming" right from birth.

* * *

If you have live stock- seed grain, or other farm produce for sale, advertise in The Maritime Farmer.

HORTICULTURE.

MAKING OLD TREES BEAR

A tree is simply a big plant. It is fed through its roots and leaves the same as the tiniest clover plant. The fact that it is large and sturdy looking leads many to believe a tree can be neglected, that it doesn't need the cultivation, fertilization, and general care that must be bestowed on smaller species of plants to make it thrive.

However, this belief is fallacious. To be sure, many trees will do fairly well even if neglected. But the same is true of more fragile forms of vegetation. Some will die, others will continue to live but will not show healthy growth, nor will they bear well if they are fruit trees, unless they happen to be favored by especially favorable natural soil conditions.

Hard, impervious soil is the tree's greatest obstacle to maximum thriftiness.

Plowing the surface between and around trees helps some, but when a tree is eight or ten years of age, or older, its roots go down several feet. The plow cannot break up the hard subsoil, and thus little or no relief is afforded the feeding roots by plowing. In fact, surface plowing encourages shallow rooting, which every horticulturist knows is bad for a tree.

To date the only practical remedy that has been found for hard soil is blasting with dynamite. Its use enables the orchardist to deeply stir and break the subsoil.

The blasting is quickly and easily done, usually an inch and a half soil auger being employed to put down holes to a depth of about three to four feet. One quarter-pound charge of a slow dynamite, five or six feet out from the trunk, is generally sufficient for a tree under five years old. For larger trees from two to six charges, planted at different points around the trunk, will be required. The proper point to place the holes for the older trees is out at about the edge of the foliage line.

The effect of the blasting is to break up the hard soil, enabling the roots to advance easily into new feeding beds; also to increase the water-storage capacity of the subsoil so that the tree may not suffer from lack of moisture during periods of drought.

POISONING THE POTATO BEETLE

In any community where the Colorado potato beetles are present all possible measures should be taken to exterminate them, or at least to keep them under reasonable control. The following treatment of this pest is recommended:

The way to fight potato bugs is by poison, and the secret of greatest success is promptness. When first the tiny baby bug, newly hatched, begins to feed he may be killed by a poison solution one-third or one-half the strength needed to exterminate his brothers only four or five days older. The standard solution is paris green and water, from three-quarters to one pound of paris green in a 40-gallon barrel of water. When used in this strength the paris green, especially is of an unreliable brand, may burn the potato foliage somewhat, but this can be prevented by adding unslaked lime at the rate of two pounds to every pound of paris green. The lime has nothing whatever to do with killing the bugs; it simply prevents the poison from doing what one is trying to prevent the bugs from accomplishing—that is, destroying the foliage. If lime is used it should be dissolved and strained before adding to the bulk of water, otherwise it may clog the nozzle of the sprayer.

Here are a few pointers as to the use of the paris green:

1. Don't throw it on top of a large amount of water and attempt to stir it in; much of it will attach to the sides of the barrel. Rather take a little water and with this make a paste of the paris green. Then by gradually adding more water the whole amount of poison can be brought into solution.

2. Keep the solution well stirred as it is used. Paris green does not dissolve in water; it is simply held in suspension. Don't let it settle to the bottom of the barrel.

3. Use as fine a spray as possible and don't flood the leaves. When the water runs off the poison is running away with it. If sprayed on finely without dripping more solution actually remains on the leaf than if it is flooded.

4. Try to avoid spraying before a rainfall. The poison will wash off.

5. Respray as often as necessary throughout the season. If well done, two or three treatments should suffice. Paris green sells this year in country stores at from 60 to 75 cents per pound, and from one to one and a half pounds per acre is enough, if well put on, to do the entire season.

PRUNING THE TREES

Always use a pole saw and pole shears on the tips of long branches, and use the pole hook in removing dead branches of the ailanthus and other brittle trees where it would be too dangerous to reach them otherwise.

Do not "head back" or cut off the top of a tree except where the tree is old and failing, and then under special instructions.

Be as sparing and as judicious in pruning as possible, and do not raise the branches so high as to make the tree look like a telegraph pole.

Commence pruning the tree from the top and finish at the bottom.

Make every cut as close and parallel to the trunk as possible.

To make the cut perfectly smooth the saw must be well set and sharp.

Leave no stubs, dead and dying wood, or fungus-covered branches behind you.

Do not fail to cover every wound with coal tar, not allowing it needlessly to run down the trunk.

Do not remove several large branches on one tree at a time. They must be removed gradually, the work extending over several seasons.

Prevent tearing the bark off the trunk in removing large limbs by first making an "undercut."

Make the cuts on a slant. Some trees, like the elms, sycamore, linden, and willow will stand the process of heading back more than others, and the poplar is a tree that must be cut back every few years to keep its crown from becoming too tall and unsafe.

When shortening a branch, leave a few twigs at the end to draw the sap to the freshly cut wound and thus enable the growing layer under the bark to heal it over.

In trimming small branches or shoots the cut must be made just above a bud.

When several branches come out from the trunk in a whorl they should not all be cut away at the same time lest the tree be girdled. This arrangement of branches occurs most frequently in the coniferous trees.—American Forestry.

TIE CAULIFLOWER HEADS EARLY

As soon as the heads begin to form great care is required in trying up to protect them from the sun, wind, and dust. Perfect heads are what we should aim to get. From them we derive the profit. The tying should be so done that it will be easy to see when the head is ready to cut. Good judgment is required.

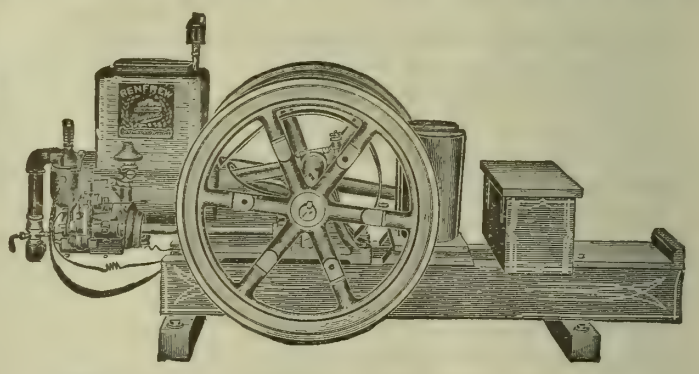
It is better to cut a little early than too late. Young, tender heads are more salable. More are consumed if taken to market young than later. If danger from frost threatens, the leaves should be tied more closely. This will protect heads from a certain amount of frost—say, seven degrees.

ARTISTIC MARKINGS

The tendency of many fruit growers is to not pay enough attention to the proper marking of their boxes and barrels. For this reason they do not obtain the high market price.

Some growers are using stencils of special design to much advantage and thereby greatly increasing their output.

The War Brings New Farm Labor Problems



FOR years there has been a shortage of farm labor in Canada. Recruiting has intensified this shortage, for thousands of farmers' sons and able-bodied hired men are now in khaki. Many farmers are at their wits' end to know how to carry on their work under today's conditions.

While the

Renfrew Standard
It starts without cranking

gasoline engine cannot altogether take the place of the absent workers, it can lift a great burden of work off the farmer's shoulders.

It can furnish power for cutting wood, fence posts, turning handles, running the grindstone.

It can drive the thresher, grain elevator, straw cutter, fanning mill and hay press. It can run the sausage grinder, green bone cutter, separator, churn and washing machine. It can pump water for the cattle.

THE Renfrew Standard gasoline engine can do the work faster and at a great deal less cost than man-power. It enables the farmer to do a great deal more work, saves him a lot of hard labor. It's a war time necessity.

Any young boy or girl of average intelligence can run a Renfrew Standard gasoline engine. No trouble to start it—it starts without cranking. It has two complete ignition systems—high tension magneto and batteries. It has a carburetor that saves gasoline—and a fly ball governor that enables it to be regulated as closely as a steam engine. It is a big, strong engine—for example, the 6 h.p. Renfrew Standard is almost as large as the average 8 h.p. gasoline engine.

All sizes from 1½ h.p. to 60 h.p.—stationary, portable and semi-portable. Write for engine catalog and prices.

We also have a full line of ensilage cutters, grain grinders, saw frames, etc.

THE RENFREW MACHINERY CO., Limited, - Renfrew, Ont.

Agencies almost everywhere in Canada

Unable To Sleep Or Do Any Work.

SUFFERED FROM HER NERVES.

Mrs. Thomas Harris, 8 Corrigan St., Kingston, Ont., writes: "I had been a constant sufferer, for many years, with my nerves, and was unable to sleep at night, or do any work through the day. I at last decided to consult a doctor and find out what was really the trouble. The first one told me I would have to go under an operation before I would be well, but I would not consent to this. One day I took a fit of crying, and it seemed that if anyone spoke to me I would have to order them out of the house. I must have been crying two hours when my insurance agent came in. He advised me to try a box of Milburn's Heart and Nerve Pills, and I at once sent to the drug store and got two boxes, and before I had them taken I felt like a different person. I have told others about them, and they have told me they would not be without them. I am very thankful I started to take Milburn's Heart and Nerve Pills."

Milburn's Heart and Nerve Pills are 50 cents per box, or 3 boxes for $1.25, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Famous Little No. O Power Mixer

Turns out a batch of thoroughly mixed concrete in less than one minute. Discharges from either side, which other mixers do not do. Also mixes your lime and cement mortar to perfection. Light, durable, highly guaranteed, and has a big reputation. Adapted for a hundred different kinds of jobs. A great money saver. Write for our special offer.

WETTLAUFER BROS., Limited

APPLE SHIPPERS COMBINE

On August 2d and 3d the first annual convention of the newly organized National Commercial Apple Growers' Association was held in St. Louis, Mo. This marked the permanent organization of the society which was launched in St. Louis in une, when Senator Dunlap, the well-known Illinois orchardist, acted as temporary chairman and H. C. Irish, of St. Louis, as secretary.

The foremost apple growers of the country are lined up with this new organization. Generally the past season was unsatisfactory to a majority of commercial growers. The lack of unity, poor quality apples, and attendant low prices broke the market early, and it is to avoid a repetition of these conditions that the association was formed.

This association is not intended as a horticultural society, for the business or theoretical or cultural subjects—but has for its aim efficient co-operation among the members to eliminate waste and insure a more uniform market distribution than has prevailed in the past. It is not a trust. No individual or concern who reaps a legitimate profit from the apple business will suffer, but with the information this association will be able to gather and disseminate among its members each member can the more intelligently make his price and terms, since he will be informed upon market conditions as well as the buyer.

It is its purpose to maintain an office in charge of an experienced man, who will act as secretary-statistician in the pay of the association. He in turn will disseminate daily market and crop information, both by bulletin and in response to direct inquiry. Laws, market regulations, and other subjects of vital interest, present and future, will be analyzed and present 1 for the benefit of the members. Such information will first be given in confidence to members only.

THINNING FRUIT PAYS

The man who puts on the market inferior fruit does an injury to both himself and the fruit business.

Fruit can be too large for the market, but it seldom is.

Thinning is the only recipe for large, plump, high-colored, juicy fruit. It pays.

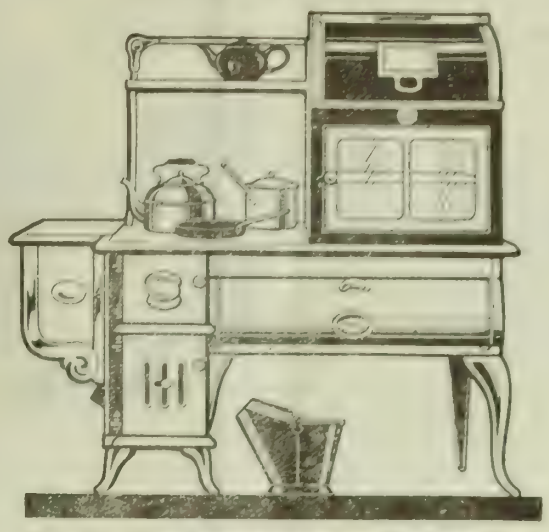
Nobody wants undersized or misshapen fruit. A crate of little peaches never brings as much as a crate of big ones. So it pays to reduce the number of crates by thinning if the quality is thereby much improved. Often, however, there will be just as many crates as there would have been if no thinning had been done. Sometimes there will actually be more. The large fruits are more cheaply picked, packed, and handled.

Thinning saves the fertility of the orchard. Not very much fertility is taken away in the pulp, but the seeds draw heavily on it. In other words, the man who thins takes off more good fruit, gets more money, and removes less fertility from the orchard. He also saves his trees from exhaustion. It pays.

CLIPPINGS AID LAWN IF PROPERLY USED

The question often arises whether the cut grass should be left on the lawn or removed. The following may solve the problem:

A lawn will always do better when some form of top dressing is applied each year. Well decomposed sheep manure is best. When no manure is used grass clippings will take its place to a certain extent. In such case it serves a double purpose—as a mulch and as humus. The mulch protects the plans from drying out, and the humus aids in the formation of plant food. There is danger of overdoing the above, for if the layer of clippings becomes too deep they will heat when this overheating. water is applied. As a result, the So, to be on the safe side, remove grass roots become injured through all but every third or fourth cutting.



LIGHTER DAY HIGH OVEN COAL RANGE

STOOPING—bending over to an oven makes baking day so wearisome. Now, it is needless exertion. The Lighter Day Coal Range has a Handy-height Oven. The Handy-height Oven has a Clearview Door. There is no bending over—none. Dishes can be watched as they bake. This saves many weary trips to the oven.

Eureka Potato Digger

Gets the Potatoes and separates where no other digger can

A strong statement, but an actual experience many times, saving growers more than the cost of the Digger. Ask us for the proof.

The Eureka elevator and duplex shaker provide more separation than other diggers. Large wheels and main gears supply ample power. Mostly malleable and steel, avoiding frequent breakage and lost time. Growers report digging 80 or more acres without repairs. High clearance over shovel prevents weeds and vines bunching. Has vine-turner attachment.

6-ft. and 7-ft. sizes; several styles.
Prompt shipments from distributing points.

Wilkinson Plows

THE oldest line of steel beam plows in the Dominion, made in the old Wilkinson Plow Co's factory, by old Wilkinson Plow Co. experts—every one of them men who know their business. It is **the standard line of plows** and includes 25 or more styles to choose from. U. S. S. Soft Center Steel Moldboards, highly tempered and **guaranteed** to clean in any soil. Steel beams, steel landsides and high carbon steel coulter. Clevises can be used either stiff or swing. Each plow is fitted especially with its own pair of handles—rock elm, long and heavy and the right bend. The long body makes it a very steady running plow. Shares of all widths — specials for stony or clay land.

General purpose, light, medium, and heavy, side hill, sod, drill or one horse plows

The plow shown turns a beautiful furrow, with minimum draft and narrow furrow at finish. *Ask for new booklet.*

Repairs for all Wilkinson Plows

LIVE STOCK.

TAKE THE HORNS OFF

It is quite generally the practice at the present time to remove the horns from cattle. To be sure. Jersey and Ayrshire fanciers do not remove these appendages from their favorites without many a pang, as neither of these breeds seems to fill so perfectly the eye of such persons when without horns. Hence it is that breeders of fancy stock do not usually remove the horns from those animals that are to be offered for sale.

It is safe to conclude, in the light of our present knowledge, gained through experience, that dehorning as generally practiced is decidedly a humane operation, and should be more generally practiced than it is. Numerous injuries are thus entirely avoided, not to mention the much greater ease and safety in handling cattle after removal of horns.

There are two periods in the life of a bovine when the horns may be removed—when very young, and after reaching maturity. The method of procedure will vary greatly with the age of the animal. After a careful study of methods, results, etc., I think all will agree that, everything considered, the best time to operate is when the animal is young. At this time very little skill is necessary; there is little constitutional disturbance and consequent loss in products and flesh; and, to me more important still, seems to be the fact that animals thus operated upon in the large majority of cases come out with no serious scar or deformity, and have a perfectly smooth poll closely resembling those animals born hornless.

When mature animals are dehorned it is very common to see stumps left varying in length from one-half to two inches, which are weapons almost as savage as the entire horn. In this operation considerable skill and experience are required to give uniformly good results. When performed by the inexperienced, great difficulty is encountered in properly restraining the animal, this often resulting in a hurried and incomplete operation.

This operation should be performed either in the fall after the flies have disappeared or in the early spring before flies have arrived. It is more or less cruel to operate during the heat of the summer when flies are numerous.

The important thing in this operation is to have the animal securely held in some way. Where much of this work is done an especially strong stanchion is desirable. For ordinary purposes a ring in or near the floor through which a rope can be drawn will answer, so that the head may be pulled down with the aid of nose tweezers and securely held. The horns are best removed with one of the patent dehorning shears so constructed as to give great leverage.

In removing the horns it should be cut down close to the hair. Some say that to insure good results a ring of the skin should be taken. Care should be used not to cut too deeply, however. as serious bleeding sometimes follows. For a dressing all that is used is a little pine tar and a pad of absorbent cotton or oakum to check the bleeding and keep out the dirt.

Newly dehorned animals should not be allowed to feed from hay or straw stacks, where the wounds would become filled with chaff and dirt and possibly give rise to serious complications. When serious bleeding follows the operation, use either tincture chloride of iron and a pad of cotton or touch the small arteries with a white hot iron, searing them over. When a case gives considerable trouble I would by all means advise the latter.

As a result of many experiments covering a wide range in time and country, it has been decided that the best dehorning agent is caustic potash fused in the pencil or stick form. Directions for dehorning calves usually state that the caustic should be applied as soon as the budding horn or button can be felt under the skin. As a rule, this can be done when the calf is but a few weeks old, and although it is claimed by some that horns may be removed from animals six months old it is undoubtedly best to operate early.

When the proper time arrives, clip the hair over the horn from an area the size of a half dollar, wash with soap suds, and rub on the moistened caustic. To prevent the caustic from running, moisten it only slightly, and apply lard or vaselin all about the spot treated. When the scabs fall off a careful examination should be made, and if the horn is still prominent make another application of the caustic. To protect the fingers, wrap the caustic well with paper. If active caustic is thoroughly applied over a sufficiently large area the horn will unfailingly be killed by one application.

By all means, dehorn your calves, thus saving time and perhaps avoiding serious personal injury.

SCOURS IN YOUNG PIGS

Cure scours by finding and removing the cause of the trouble. If the pigs are kept free from scours and thumps they have escaped the most common trouble of the pig pen. The ailment is really a symptom of indigestion caused by changing the feed of sow, too much feed, dirty pens and troughs, or chilling the sow or pigs in cold rain or winds.

Changing the feed of either sow or pigs from sweet to sour milk will often cause scours, and so will the improper use of feeds like blood meal, tankage,

and oil meal, which contain more protein than the other feeds which the animal has been eating. It is usually well to feed both sow and pigs all they will eat, but if this should result in stimulating the milk flow so that the youngsters get more than they can digest, scours will result, and the sow's feed must be cut down.

Clean dry quarters and clean troughs will do much to prevent scours by preventing the pigs from swallowing filth which contains germs which multiply in the stomach and intestines and cause digestive trouble. If the sows have been wading through mud and filth before being suckled by the pigs the same results are likely to follow. So they should all be kept in clean dry lots where the sun has a chance to get in and kill the germs, and good ventilation makes the air pure and helps to keep the floors and lots so dry that any germs that are present are less likely to be taken by the young pig when it sucks or eats. This can be arranged by opening up trap doors in the roofs of these sheds during warm, sunny days and closing them when the cool nights make protection necessary, or rains threaten to come in through the open doors and chill the sows and pigs or soak their beds.

If scours appear in spite of all precautions, the following treatment has proved valuable to the Missouri Station: Reduce the sow's feed, clean up more thoroughly than before, and give the sow a tablespoonful of sulphur in each feed for several days. It is also well to give the sow a good dose of epsom salts. If practicable, each pig may be given a teaspoonful of castor oil, or epsom salts, and charcoal should be provided in any convenient way. If no cheaper charcoal can be secured, it can be supplied by starting fires of cobs and then putting the fires out before they burn out.

Thumps in young pigs result from too much feed or too little sunshine or exercise, or both. The remedy is to reduce the sow's feed and compel the pigs to take plenty of exercise in the open air and sunshine. This treatment is only effective for pigs that have not been weaned, since thumps in older pigs is usually caused by trouble in the lungs or bronchial tubes. —L. A. Weaver.

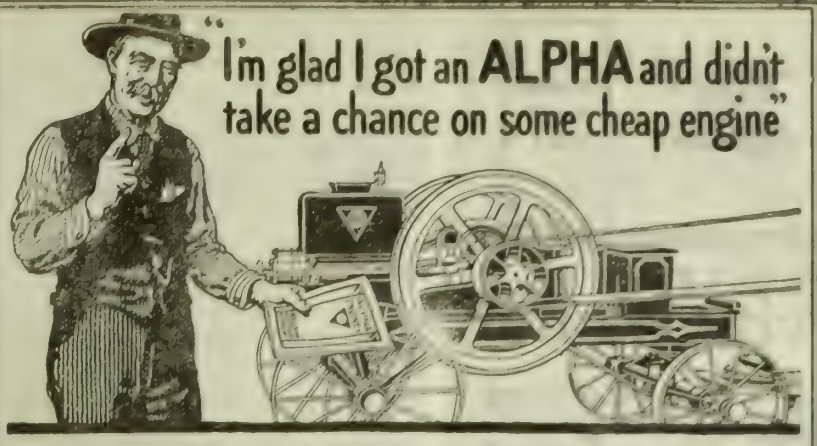
CALVES IN HOT WEATHER

A little extra care during the warm weather period will place calves on a footing that will carry them a long way toward being the best possible cows, while if they are neglected at that time it is almost impossible ever to get them started right again.

We may well place shelter and other protection from flies first in the list of things to do. If free from flies the calves will grow much faster than if they are compelled to fight these pests all the time. A shelter of some kind is therefore a fine thing. We took an old hen house and turned it into a calf house. At the door we hung a strip of burlap large enough to cover the opening. The calves soon learned that they could push this aside and go in when they wanted to, and as they entered the cloth brushed the flies off their backs. A little spray of fly killer will help, too, very much and should be applied every morning.

Shelter of this kind is also a good thing in stormy weather. We lost a fine pure-bred calf one year simply because it was permitted to run out in all kinds of weather and lie on the ground. We thought the earth was warm enough, but the calf took cold and died of bowel trouble. Since then we have taken pains to get the little chaps in when it is raw and stormy.

The food given is very important at this season. No doubt many a good calf has been spoiled by being fed today sour milk and tomorrow sweet. When we get our calves on one kind of feed it is well to keep them there. Again, some hay every day is the best thing possible. If a calf has plenty of nice bright hay regularly, even if out on grass, it will not be very apt to have any trouble of the bowels. The juice of the hay has a curative value. Plenty of water should be given in connction with th milk. These are all surely worth while things in bringing up a calf.—E. L. Vincent.



SOMETIMES a man is tempted to buy a cheaper engine than the Alpha, hoping to save a little money. If you are tempted to take such a chance, it will pay you to first study engine construction carefully. It is only reasonable to assume that if other engines were as good as the Alpha they would cost just as much. Why shouldn't they?

In considering the purchase of an engine, do not let the first cost blind you to the vitally important things you wish to buy in an engine. You want an engine that has plenty of power; that is simple and easy to operate, that is free from weak, complicated, troublesome parts; that is strong and durable enough to give you years of good service. With these things in mind, compare the Alpha, part for part, with any other engine. You will then see that for the slightly higher cost of the Alpha you get by far the most for your money.

Then talk to any of the thousands of Canadian farmers who are using Alpha Engines and they will tell you they are glad they did not take a chance on some "cheap" engine. It does not pay to take chances. Be on the safe side and buy an engine that sells on its merits; that has something more than its price to recommend it.

There is nothing mysterious about the superiority of the Alpha. The better design of this engine, the quality of material and workmanship that go into it, are easily seen. Ask for a copy of our catalogue. It illustrates and describes every feature of the Alpha and every feature of this engine has in it some sound reason why the Alpha will give better service and last longer. Read the catalogue carefully and you will see where the extra value comes in.

Alpha Engines are made in eleven sizes—2 to 28 H. P.—each furnished in stationary, semi-portable, or portable style, with hopper or tank cooled cylinder.

TOO MUCH SALT MAY KILL ANIMALS

Samples of salt are occasionally sent to the Agricultural College for analysis with the statement that animals, usually cattle or sheep, were poisoned after eating it in considerable quantities. In no case has any foreign substance that would account for the poisoning been found.

Since salt is necessary to life and is in universal use, it is difficult to realize that in large amounts it is poisonous. Many cases of poisoning in chickens have been reported and occasionally in larger animals. In one instance salt was by mistake used instead of sugar in making a cake. The cake was given to the chickens and killed all of them. Chickens are very susceptible to salt poisoning, and while the amount that it takes to kill a horse or cow is considerable, this sometimes occurs when these animals are especially salt hungry.

When animals have not had access to salt for a long time it is safer to give it to them sparingly at first.—I. E. Newsom, Coloroda Agricultural College, Fort Collins, Colo.

AUTOMATIC DIPPING TANKS

A wallow is as necessary for a hog as a bath tub is for a human being. A clean bath benefits the health of a hog, especially if the wallow is filled with a dipping solution. This combination not only saves the lives of fat hogs on hot days, but also aids greatly in preventing cholera.

Locate the wallow in a convenient place near the water supply. A level, well-drained spot, where the mud will not wash into it, is best. Make the wallow 8 by 12 feet. Dig out the hole with straight sides to the depth of 2 feet 2 inches. Lay a drainage foundation 10 inches thick. Set a 10-inch board around the outside of the hole to keep the dirt from crumbling in on the concrete.

Mix the concrete 1:2:4 and place a 6-inch floor in the hole. As the concrete is laid, embed woven wire in it 1 inch from the bottom. Have the concrete for the side walls fairly dry and tamp it to the shape and dimensions —4 inches thick at the top and 10 inches at the floor line. The sloping sides make cleaning easy. Keep all animals away from the wallow for two weeks. Three men built this wallow easily in one day.

The milch cows are not benefited by a walk of a mile or two to pasture each morning and evening. Occasionsionally arrangements can be made so as to have the young stock in the furthermost pasture and the milk cows in pasture nearer home.

DAIRYING.

THINGS TO AVOID IN BUYING A COW

If I were going to buy a dairy cow, here is the kind I would not want. I would pass her by every time and go on looking for my ideal of a cow.

I don't want a cow with two or even one horn. She might horn me or my dog, or some valuable farm animal.

I don't want the old cow. She cannot chew her food, she is apt to be unhealthy, and I might have to haul her to the bone yard.

I don't want the cow that has been sick or is sick. Her constitution is out of fix and if I drink her milk or eat her butter my constitution might soon be out of repair.

I don't want the cow with knots on her jaw or any other part of her body; makes no difference how long they have been there or how little harm they may have done. She might wake up some morning with the lamp jaw in good shape.

I don't want the cow that has short teats. My hand is very good size, and I never could milk a cow well with two fingers. I let her pass.

I don't want the cow that gives a stream of milk about the size of a horse hair when you are pressing with all your might on her teat. Takes too long to milk her and waste a man's strength. She can go to the butcher as far as I am concerned.

I don't want the cow that gives a gallon of milk in the summer and goes dry in the winter. Feed is too high for me to board such a cow. She may raise a good calf, look fine, and all that, but I will not put my money in her.

I don't want the cow that will kick the bucket of milk over my head and jump over the moon besides. Never did like a kicker of any kind, especially one in the bovine family. Clothes are too high priced and doctor bills are out of sight these days.

I don't want the cow that gives you a friendly butt when you are not looking. I have no eyes in the back of my head, and just when I did not want to be butted would be the time she practiced her butting stunt. Then she might get after the wife or the children, and they don't want to be butted any more than I do.

I don't want the cow that knows how to go through hedge and barbed wire fences and to unlock the gate or the stable door. No, she is a little too smart a cow for me. I don't like to keep a cow tied up, and I am not an expert at making cow yokes.

I don't want the cow that is wild as a deer. I am not a cowboy and I do not wish to spend an hour each evening on a pony rounding the sister up so that I can get a quart of milk from her unfriendly hide. No, she doesn't suit me. I want the gentle cow.

I don't want a cow that is always flopping her tail in my face even when there are no flies in the country. I never did like to be compelled to tie a cow's tail to my boot strap or the rafters of the barn while I robbed her of the lacteal fluid.—W. D. Neale.

DOES IT PAY TO RAISE PURE BREDS?

When you begin to talk dairying to a man, the first thing he asks is: Shall I put in pure breds or grades? There is a great demand for both pure bred and high grade dairy cows, and any farmer that is a good feeder and caretaker can make money by raising either or both to sell; but a man must first succeed with grades before he can expect to succeed with registered stock. The safest plan is to buy a good registered bull and grade up a good herd and see how much better they are than ordinary common cows. And then add two or three pure-bred heifers and give them good care, and you will see them beat the grades so much that you will get that pure-bred enthusiasm that is necessary for success in any line.

In our own herd we used a registered Guernsey bull on grade cows until his daughters began to come in; then we were so well pleased that I borrowed $300 and bought three registered Guernsey heifers.

From this start start, five years ago, we have sold two cows for $560, five bulls at an average of $45 each, and I recently sold a heifer calf ten months and eight days old for $225 spot cash, and our herd now numbers thirteen head—ten cows and three calves—for which we were recently offered $275 per head for the cows and $325 for the three heifer calves.

After receiving $225 for the heifer calf and getting the good offer for the others, it has enabled me to store up enough pure-bred enthusiasm to last a lifetime, because I believe there is a great future for the young man that is breeding good dairy stock.

I recently filled an order for some South Carolina farmers for twenty-nine head of high-grade and registered Guernseys, for which they paid the Virginia farmers nearly $4,200. In January I shipped these same South Carolina farmers $3,000 worth of grade Guernseys. I could not find them in Virginia, and was compelled to leave that money with Maryland farmers. When more farmers in this state have learned the value of good pure-bred bulls we can fill orders for dairy stock without going out of the state. In the past seven years I have purchased $97,000 worth of dairy cows for southern farmers, and nearly all of this money has gone north and west. Dairying is yet in its infancy, so let's start now to raise nothing but good dairy stock. A two-and-a-half-year-old heifer is worth more money than two steers at the same age.—C. T. Rice, Fairfax County, Virginia, in Southern Planter.

MILKING CONDITION

The production of large quantities of milk constitutes a heavy drain upon a dairy cow, and unless compensated for by an adequate supply of food of sufficiently good quality it causes her to lose flesh. It is evident that if cows are fed on a poor diet while they are yielding milk they are bound to be very poor in condition. The milk yield naturally suffers greatly, and the cows do not give as much milk as they are capable of yielding, while they also tend to become dry very quickly. When cows which are unduly thin owing to poor feeding receive a generous and rich diet they do not as a rule straightway respond to the improved diet by giving more milk, because the extra food at first goes toward improving the cow's condition, and not toward an increased secretion of milk. Only when the cows have improved in their bodily condition will they respond to the improvement in their diet by an increased milk yield.

When dairy cows which are in milk get fat as the result of a too plentiful supply of rich and fat-producing food, they fall off in their milk yield. An unduly fat condition causes the cow to dry off sooner than she would do if in proper milking condition. Some dairy cows lay on flesh and fat easily and readily when fed in a liberal manner; it all depends upon the nature of the cow and upon her breed. Dairy Shorthorns and cows with a preponderance of Shorthorn blood in them are generally well-fleshed and readily lay on fat while milking when their diet is of a fattening nature and very generous. The same applies to Red Poll cattle, and in fact to all cows of the dual purpose type in which flesh-making capacity is an inherent quality. Cows of the Channel Islands breeds—Guernseys and Jerseys—being of the purely dairy type, naturally do not tend to become fat when in milk. Ayrshire cows also do not usually get into too fleshy or fat condition during their milking acreer.

Cows which are exceptionally deep milkers and which yield unusually large quantities of milk are very often

Inside Comfort

When the Thermometer outside registers below zero you will find that you can keep your thermometer in the hall up to Summer Heat, 70 degrees above zero, if you have an

Enterprise Blazer Furnace

installed in your cellar. With this furnace you secure an **even** temperature, **perfect** ventilation, **economical** fuel bills, and simplicity of operation.

Made in the country where furnaces are used the most, and by a firm with large experience in Furnace making, an "**ENTERPRISE BLAZER FURNACE**" will give more heat and comfort for every dollar expended than any other on the market.

Fully illustrated booklet telling you all about it, free for the asking. Also testimonials from people using the Enterprise Blazer in every Province in Canada.

How much do You Lose on Each Cow?

Will you admit that there may be a little cream left in your skim milk? Few dairymen realize that this loss on each skimming twice a day would more than pay for a

"SUPERIOR" SEPARATOR

in the course of a year. That's a statement that needs support. The book of Superior facts will support the statement—the machine itself will prove it. Write to-day for the handsome book that reveals new lights on Separator construction, tells in simple language about the self-balancing bowl, the bicycle-clutch crank, and the advanced oiling system.

The prices of the Superior Separator are $52.50 and $65.00, according to capacity. Full details in the book.

THE ONTARIO MACHINE CO., LIMITED
18 BLOOR STREET EAST TORONTO
16

particularly thin in condition and look unduly lean and poor. This is due to the enormous drain they undergo in consequence of yielding so much milk.

A common mistake is to suppose that exceptionally heavy milkers must necessarily become thin when in full milk and that it is not possible to maintain them in satisfactory bodily condition. Cows of this kind naturally require a larger supply of concentrated food in order to keep in good bodily condition than cows that are not such deep milkers, because they use up more food in making milk than the latter, but when their requirements are fully met by an increased or extra allowance of concentrated foods they can well be maintained in satisfactory condition. There are doubtless some deep-milking dairy cows which are by nature bad doers, and which become very lean and lose condition after having been in milk for some time, despite the most liberal ration of rich concentrated food, or despite rich and plentiful grazing; but such cows are the exception and not the rule among heavy milking cattle. However large a quantity of milk a dairy cow may yield, it is generally easy to keep her in proper bodily condition if her requirements in the way of food are fully satisfied. Quantity of food is of no importance here; what is required is sufficient food of a rich quality.—G.

How to Have Dry Buildings

IRON doesn't wear out, it rusts out. Ready Roofings don't wear out, they dry out. Do you know how important this is? It means that there is a tremendous difference between ready roofings, even though all have felt and a waterproofing compound in them. It's the quality of that compound, plus the skill used in saturating the felt, that counts. It is the skill used in the saturation, plus the chemical composition of the saturating compound that makes Panamoid a wonderful roofing.

PANAMOID ROOFING

Panamoid is made of the best felt that can be obtained. It is tough, fibrous, strong. This felt is uniformly saturated with a non-volatile compound that stays there. Being thick, the felt holds this saturation indefinitely. If you want dry roofs at low cost, come in and get some Panamoid Roofing. Very easily laid.

THE ADVANTAGES OF HIGH-TESTING CREAM

The average fat content of cream delivered to many creameries is approximately 25 per cent. This means that in some instances the best is above and in others below this average. It is evident that many creamery managers, as well as many farmers, do not understand the loss involved in handling thin cream.

Cream testing 30 to 35 per cent is the most satisfactory to the farmer and to the creamery man. A comparison of low-testing with high-testing cream reveals for the latter the following advantages:

(a) To the creamery man:

1. Less bulk to handle, hence less labor, fewer churnings, smaller equipment and building.

2. Less buttermilk, hence less loss of fat in buttermilk.

3. Costs less to pasteurize, about one-half as much steam is required per 100 lbs. of fat in 34 per cent cream as in 17 per cent cream; two-thirds as much in 33 per cent as in 22 per cent cream. In cooling the cream less water or brine is required for the handling of the same amount of fat when the cream is rich than when it is thin.

4. In pasteurizing sour cream the formation of large curd particles, with the attendant loss of butter fat, is avoided, to a great extent, if the cream contains more than 30 per cent fat.

(b) To the farmer:

1. Less bulk to handle, hence fewer cans and smaller cooling tank required. Fifty pounds of 34 per cent cream and 100 lbs. of 17 per cent cream both contain the same number of pounds of fat.

2. Less bulk to cool, hence less ice or cold water required; quicker cooling, hence less deterioration. Cream spoils in a short time if not quickly cooled and held at a temperature below 50 degrees Fahrenheit.

3. Less bulk to haul to creamery.

4. Better keeping qualities of the cream. Bear in mind that it is not the fat but the other solids in the cream which become sour and spoil. As thin cream contains more of those solids it sours sooner than thick cream.

5. More skim milk kept on the farm. The farmer who delivers 100 pounds of fat in 17 per cent cream delivers 294 pounds of skim milk more than he would if he delivered 34 per cent cream. Unless the buttermilk is returned free this is a dead loss to him. At 25 cents a hundred pounds it amounts to nearly 75 cents, or three-fourths of a cent on each pound of butter fat delivered.

Farmers sometimes offer the following objections to high-testing cream: Thick cream may stick to the can and be a loss to the farmer; improper samples may be taken because of insufficient mixing; a high test is more likely to be cut than a low one.

In a properly operated factory, however, these objections do not hold, and the creamery man who would have his patrons deliver rich cream will manage the plant so efficiently that there will be no grounds upon which to base such objections.

Don't shut the bull up in a dark, lonesome place.

Every pig raiser should have a patch of rape. When it is eaten down the pigs should be taken off until the new growth starts up sufficiently.

Don't Delay buying a

DE LAVAL SEPARATOR

a single day longer

IF YOU ARE SELLING CREAM or making butter and have no separator or are using an inferior machine, you are wasting cream every day you delay the purchase of a De Laval.

THERE CAN BE ONLY TWO real reasons for putting off buying a De Laval: either you do not really appreciate how great your loss in dollars and cents actually is or else you do not believe the De Laval Cream Separator will make the savings claimed for it.

IN EITHER CASE THERE IS ONE conclusive answer: "Let the local De Laval agent set up a machine for you on your own place and SEE FOR YOURSELF what the De Laval will do."

WE HAVE NOTHING TO RISK and more than a million other cow owners who have made this test have found they had much to gain.

YOU CAN'T AFFORD TO WAIT till next spring or even for another month. Let the De Laval start saving cream for you RIGHT NOW and it will earn its cost by spring.

SEE THE NEAREST DE LAVAL agent at ONCE or if you do not know him write us direct for any desired information.

THE HORSE

FEET OF HORSES—THEIR STRUCTURE AND CONDITION

The principal points to be observed in the care of colts' or horses' feet are to keep the feet in as near a natural shape as possible, and in hot, dry weather to supply moisture, says a writer in the Breeders' Advocate. So long as a colt is running with its dam on pasture the wear of the wall at the bottom about equals the growth from the top, hence the feet remain normal in size and shape. The same may be said of the unshod horse.

As soon as the colt is brought into the stable for the winter, and the outdoor exercise it gets is mainly upon straw in the yard, or upon snow, the wear becomes much less than the growth. Hence the feet become deep at the heels and long at the toes. The walls of the heel, after having grown downward below the frog, have a tendency to bend or curl upward, the bars not being sufficiently strong to prevent it.

There is also a tendency to decay of the frog, especially when the stalls are not regularly cleaned, and the animal allowed to stand upon an accumulation of manure. This causes the colt to stand and walk in an unnatural manner, in many cases too much upon the heels, often with the toes turning more or less upward during each step. The heels continue to curl inward and lessen the space in which the bones and the sensitive parts are situated, and even at that age this predisposes to disease and may even cause it by undue pressure.

The position of the whole limb is altered, undue tension is forced upon the back tendons and upon certain ligaments of the joints, which tend to weaken and in some case actually to stretch them by continued tension, and the pasterns descend until the fetlock pad almost touched the ground. In some cases a colt is practically ruined for life for want of intelligent attention during the first winter.

The feet should be cleaned out regularly to enable the attendant to observe any disease of sole or frog and to remove stones, nails, and other foreign bodies that may be present, and while possibly not causing trouble or inconvenience would doubtless do so later on. So soon as the hoof becomes too large or abnormal in shape it should be cut and rasped down to the normal size and shape.

The heels should be kept well rasped down and the toe cut off, and of course the lower border of the wall should be rasped until the wall is of the proper depth. This trimming should be done once each month until the colt will spend the greater part of the time outside on bare ground, when the wear should be about equal to the growth, and no further trimming should be necessary until the next winter.

When the animal reaches the age at which he must wear shoes conditions change. The wearing of shoes is generally supposed to be the cause of much lameness. It is probably the conditions that necessitate the wearing of shoes, rather than the shoes, that are responsible.

If the work and the ground were such that the feet would not break or wear down to the sensitive structures, the wearing of shoes would not be necessary, and if shod horses were worked on such ground lameness would not be caused; but where horses have to travel on ground of such a nature as to necessitate the wearing of shoes the concussion is sufficient to cause or predispose to lameness of different natures. Careless or ignorant shoeing predisposes to and sometimes causes lameness.

When a horse goes lame there is a great tendency on the part of many owners to attach all blame to the shoeing smith. While in some cases the smith is to blame, it is a fact that in very many cases he is not in any way responsible for the trouble. Fortunately our country is fairly well supplied with intelligent shoeing smiths, who understand their business, often much better than the owners of the horses they shoe, and who are ready to ascribe the cause of all foot trouble to the unfortunate smith.

The principal points that should be observed in shoeing are to first trim the foot to the proper size and shape, being sure to have the surface that will bear upon the shoe level. In trimming the foot the sole should not be weakened, and the bars should not be cut down to a level with the sole. The partially detached portions of sole and bars should be removed, but very little more.

A shoe should then be made to fit the foot with as little burning of the horn as possible. The bearing surface of the shoe should be fit in order that a portion of the weight of the animal be borne by the circumference of the sole instead of allowing it all to rest upon the wall. Exceptions to this exist when the foot is particularly flat or convex soled, when the bearing surface should be beveled downward and inward with the exception of sufficient surface for the wall to rest upon.

When the weather is dry and the horse will not be required to go in slippery places or draw heavy loads, it is better to use a simple flat shoe or only moderate thickness in order to allow the frog to come in contact with the ground and support its share of the weight. When for any reason it is considered wise or necessary to wear calkins, they should not be higher than absolutely necessary. Probably one of the greatest mistakes is the use of too high calkins. This is principally noticed in heavy horses. High calkins serve no good purpose. They do not remain sharp longer than low ones, neither do they make the horse more sure footed on slippery roads. They elevate a horse too much and increase the danger of altering the proper level of the foot, which predisposes to sprain. Of course, there are many cases in which horses with undesirable peculiarities of action may be benefited by the application of shoes that would not be satisfactory on a horse of normal conformation and action.

Horses that interfere, speedy-strike, or forge require special shoes, and the smith is justified in trying to overcome the trouble by using shoes not of the ordinary desirable patterns. Taking it for granted that the horse is well shod, the question arises: "How should

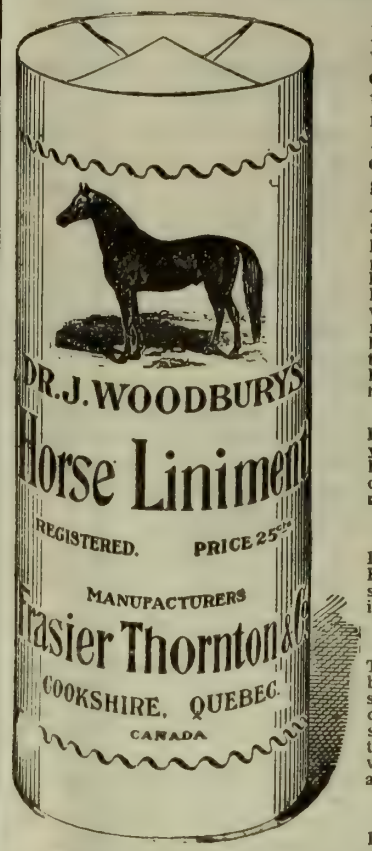
Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.

Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.

Yours truly, Clarke Bros.

Hubbard's Cove, N. S.

Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.

Yours truly, C. C. McLean.

Truro, N. S.

This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.

Newton Lee, Owner "All Right" 5817.

Elmsdale, N. S.

Dear Sirs:—Kindly send me 6 dozen bottles Dr J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

The Best Treatment For Constipation

The Experience of One Who Knows and Places Dr. Chase's Kidney-Liver Pills First.

It is not difficult to secure a medicine that will effect movement of the bowels. To cure Constipation and the complications which arise from it is another matter.

Constipation of the bowels is usually preceded by torpid action of the liver. Hence it follows that if Constipation is to be cured the liver must be set right. And here lies the secret of the success of Dr. Chase's Kidney-Liver Pills. They awaken the action of the liver and insure a good flow of bile, which is nature's cathartic. The liver, kidneys and bowels are invigorated and regulated, and the troubles with the digestive system disappear.

Mr. H. M. Bell, Innisfail, Alta., writes: "For some considerable time I have been using Dr. Chase's Kidney-Liver Pills, which I have obtained through your firm. I suppose during my life I have used nearly all the best-known pills, as I have been subject to Constipation and digestive troubles. A friend recommended Dr. Chase's Kidney-Liver Pills, and I can honestly say that of all the pills I have tried nothing has suited me better—no griping—action always insured, and fine for the kidneys. This is how I have found them after a thorough test, and you may use this statement if you like."

This letter should convince you of the merits of Dr. Chase's Kidney-Liver Pills, but there is nothing like personal experience. If you do not feel like risking 25 cents for a box, write to us for a free sample box, mentioning where you saw this advertisement. Put this medicine to the test when you have indigestion, constipation, biliousness, backache or kidney derangements. The results will soon prove to you the superiority of Dr. Chase's Kidney-Liver Pills. One pill a dose, 25 cents a box; all dealers, or Edmanson, Bates & Co., Limited, Toronto.

POULTRY.

THE WHITE PLAGUE OF POULTRY

It is safe to say that at the present time there is no disease of poultry which causes in the aggregate anything like the total loss that roup does in the northern part of the United States. Roup is widely, indeed almost universally, distributed. Every one who keeps poultry long enough is sure sooner or later to have experience with one form or another of the disease. Its germs are probably carried not only by poultry but also by various wild birds, especially the English sparrow. The biologists of the Maine Agricultural Station have had opportunity not only to observe this dread disease in all its forms, but also to gain a very good idea of its prevalence through correspondence received at the station. The best cure of this disease is prevention. In order that prevention may be intelligently carried out it is essential to know something about the causes of the disease conditions which together go under the name of roup.

There are to be distinguished two diseases belonging to this general class of troubles, as follows: (a) Roup or contagious cartarrh, when only catarrhal symptoms are present; and (b) diphtheretic roup and canker, when diphtherial patches and false membranes are formed. Some workers consider these different stages of the same disease. It is also believed by some that sore head or chickenpox is also another form of the same disease.

The commonest form of roup, the nasal roup or contagious catarrh, attacks principally the membrance lining the eye, the sacs below the eye, the nostrils, the throat and the windpipe. The symptoms first seen are those very similar to an ordinary cold, but there is more fever, dullness, and prostration. The head is often very hot, the body normal or only slightly higher than normal. The discharges from the nasal opening is at first thin and watery, but in two or three days becomes thick and obstructs breathing. The inflammation, which begins in the nasal passages, soon extends to the eyes and to the spaces which exist immediately below the eyeballs. The eyelids are swollen, and are closed much of the time. They may be glued together by the accumulated secretion. The birds sneeze and shake their heads in their efforts to free the air passages from the thick mucus. The appetite is diminished, and the birds sit with their heads drawn in, wings drooping, with the general appearance of depression and illness.

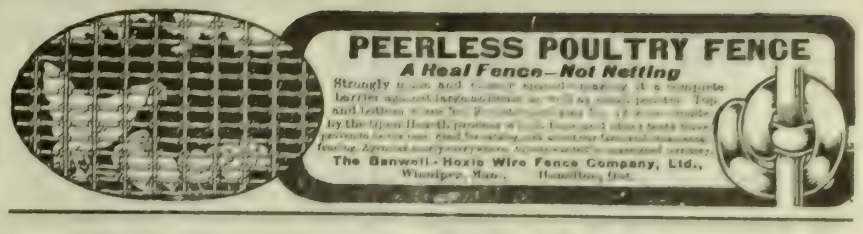
When the inflammation reaches the spaces or sacs beneath the eyes it causes the formation of a secretion very similar to that of the nose, and as this becomes thick it collects, distends the walls of these spaces, and produces a warm and painful swelling, which is seen just below the eye and may reach the size of a hickory nut. This swelling presses with much force on the eyeball, which is displaced and more or less deformed, and in extreme cases even the bones of the head may give away before it.

The closure of the eyes prevents the badly affected birds from finding food; the accumulation of mucus in the nostrils completely obstructs these passages, so that the beak must be kept open in order to breathe; the obstruction of the windpipe and the smaller air tubes causes loud breathing sounds and difficult respiration.

In the severe and advanced cases the birds sit in a somnolent or semi-conscious condition, unable to see or to eat; their strength is rapidly exhausted and many of them die within a week or ten days. A part of the affected individuals recover, but others continue weak and have a chronic form of the disease for months, during which time they continue to disseminate the contagion.

This disease is distinguished from diphtheria by the absence of the thick tough and very adherent newly formed membranes (false membranes) in the nostrils, mouth, and throat which are characteristic of the latter.

The course of roup is usually of long duration. A simple, putrid discharge from the nose may stoy in three or four days. But generally the symptoms last for months. When the eyelids become swollen and tumors appear the case is usually chronic. Affected birds may be better for a few days or weeks, and then become very weak again. Damp, cold weather usually intensifies the disease.



BREAKING BROODY HENS

To many it is a problem to break up broody hens. I have tried putting the broodies in a shady run with a vigorous cockerel. In this way I broke them up fairly well, but the method had its drawbacks, as many times the yard is needed for chicks or other fowls. At last I found a method that proved satisfactory. I put the broodies in an extra horse stall, put some roosts four and a half feet from the floor, scattered 3 or 4 inches of litter over the floor, and buried a limited amount of grain in the litter. I put in a young pig five to ten weeks old. He was always rooting around the floor. The hens did not care to sit. When Mr. Pig took an occasional snooze the hens were able to obtain some grain and water, at the same time exercising as they dug for the grain.—Harry T. Bates, in New England Homestead.

The editor of this journal has several hens in his flock that for clear, sheer persistency in clucking are hard to beat. So much so that unless one were very guarded in his remarks he might be tempted to say something that would not sound well in Sunday School. After trying all the anti-brooding devices he ever heard tell of, or read about, he finally used the following plan, which is working admirably in the most obstinate cases:

A light cord is attached to the hen's legs. The other end of the cord is made fast to some object in the yard. The cord is just long enough to allow the hen to gain shelter inside the hen house door, and yet with scope enough to allow her to rustle for her feed at the troughs with the other hens. Of course, she must be tied where she cannot fly into one of the nests.

SECRETS OF POULTRY SUCCESS

The secret of success in poultry raising lies first in getting pure-bred fowls of a known winter-laying strain and breed. The Light Grahma has grown to be the best breed in this respect around here, and every farmer who has tried it would have no other. To me it has proved to be the best I have ever heard of or tried.

The next step to take in getting eggs is to get an incubator and hatch early, as the early hatched birds is the best winter layer, and the incubator is the only means which will hatch the eggs on time. It is also less trouble to care for an incubator than for a dozen or two hens that are always fighting each other or stealing each other's nests.

The next step is proper housing. This does not necessarily mean costly or very warm houses, but a house that has plenty of air and sunshine and is simple and easy to clean. Another thing to take into consideration is proper feeds and feeding. I aim to do this as cheaply as possible, and use nothing but home-grown feeds whenever I can. They are the cheapest and even if a grower gets a few more eggs by feeding commercial foodstuffs the difference is more than made up by the higher cost of production.

For example, in my own case I have a flock of about 90 Light Brahma hens. From these I have had eggs all winter and during February have had as high as 40 eggs a day. The house is so cold that on cold days a pail of water will freeze solid in a few hours. It has good ventilation, however, and I have not had a frozen comb all winter, although the door has stood ajar day and night.

The only commercial feed which I have bought for this flock is one sack of bran and 100 pounds of oyster shells. Besides this they have always had a hopper full of ground oats before them. I have given them one peck of barley in 5 or 6 inches of litter on the floor every morning. It certainly cheers poultry men up to hear those chickens sing on a cold winter morning. As for drink, I give them water in the morning and slop from the kitchen in the afternoon.—A. A. G.

INCREASE PRODUCTION

A Chance for Every One to do His Bit

Mr. J. V. Jackson, of Moncton, President of the New Brunswick Poultry Association, has developed his Poultry and Produce Company into an incorporated concern, with seven well known business men as directors. The purpose is to multiply many times the productive capacity of the business to meet pressing demands. The Company owns 150 acres of land near Moncton, which is now used as a Poultry farm with splendid equipment. A large flock of Sheep will now be added. There is also an orchard of eight acres just coming into bearing age and a two-acre market garden. They have a warehouse in Moncton for sale of Produce and of Poultry Supplies and for the manufacture of their own special lines. Connections have been formed for a large Commission business. The Company wants this year to hatch 100,000 chicks from their incubators and to supply a great amount of poultry and Eggs to a hungry market. To do this they need some more capital and here is your chance to take a part in this good enterprise. They wish to distribute the shares of the Company widely for business reasons. So they are issuing Preference Stock, which will rank as a high grade security, and yet participate in the fine profits of the business. Before taking any dividend on the $12,000 they have already invested the directors will pay 7 per cent on all capital paid in for this new issue of stock and also give it equal rights in the distribution of surplus profits. The Preference shareholders are protected from any loss by all the present capital of the Company. As an investment for $100 or more this is a good proposition but you can judge it for yourself by getting full particulars. Anyone interested in increasing the productive power of the country or in getting a profitable place for some funds should write at once for a circular giving full information. Address: The Maritime Poultry and Produce Company, Moncton, N. B.

FOR HOME AND COUNTRY

This Department is devoted to the best interests of the Homes of the Maritime Provinces. Contributors to these columns are leaders in the "For Home and Country" movement. This Department is yours. Use it to the best advantage by sending us timely suggestions, short articles dealing with your experiences, and reports of your Institute meetings.

THE RETURN HOME

"Hello, Phil. Digging away at the old farm yet?"

The speaker, leaning languidly against the fence, held a cigarette in the most approved style between his two forefingers, and occasionally puffed slowly at it.

Phil Dryden looked up from his planting, and responded: "Why, Ed, is that you? When did you come down?"

"Ran down last night on the early train. Taking a few days' vacation, and thought I'd like to see the old place." Phil glanced rather enviously at the well-dressed smoker, and then dropped his eyes a little shamefacedly to his own coarse, ill-fitting, and faded clothes.

"Why do you stay down here, Phil, and use yourself up on this old farm?" Ed Spencer continued. "I should think you'd go to the city and get a better job. If you hated farming as I always did, you would."

Phil's face flushed a trifle. The contrast between his appearance and that of his old school friend made him uneasy.

"I have thought of it several times," he replied slowly, "but there's so much to do here, and then——"

"Oh, shucks! You hate to make the plunge. So did I. But after the first break it's all so much better. Clean sailing then. I just picked up my things and made the start. And now—well, I'm going to get a raise next month, and then I'll take it easier than now."

"I suppose the work is pleasanter," Phil stammered, "and the pay is better."

"Better?" answered Ed, a little contemptuously. "Why, you get cash there for your work; but on the farm you don't. I'll bet you haven't seen as much money as this in a year."

Producing a roll of bills, the speaker flipped them carelessly through his fingers, exposing to view several of high denominations.

"That's what you get in the city," he continued. "It's cash—every week or month."

Phil said nothing, but his mind was feverishly active. Suddenly he asked anxiously: "I suppose it's hard to get a good position at first, isn't it?"

"Yes—and no. If you have influence it's dead easy; if you don't, you have to hunt around a bit."

Ed Spencer flung away his cigarette and added confidentially:

"If you're thinking of making the change let me know. I may help you. I know the ropes a little. Just send me word when you've made up your mind."

Phil kicked a lump of earth with the toe of his shoe. Ed seemed to comprehend the state of his mind, and asked smilingly: "How are crops, anyway—slow as ever?"

A flash of resentment appeared in Phil's eyes, for he knew the question was asked in well-bred derision.

"Oh, they're pretty good," Phil replied, with some dignity. "I'll harvest a good crop this season if——"

"If potato bugs don't eat up everything, and cabbage worms don't finish what's left," laughed Ed, as he turned to leave. "Well, I must be going. I want to see the old place and get back to the city soon's I can. It's pretty slow here."

He consulted a handsome watch which hung at the end of a gold chain.

"Remember me to Bess," he called over his shoulder. "I suppose she's well?"

When the two separated, Phil Dryden picked up his hoe and stood for several minutes staring at the retreating form. Contending emotions possessed him. The old rebellious spirit rose up to make his thoughts bitter and disquieting.

Life on the farm was a drudgery, he thought, and a dozen times he had secretly longed to leave it behind, to begin work in the city. The opportunity had never been presented quite so forcibly as today, and he felt that the decisive moment had come.

"I'll do it!" he firmly muttered after the space of five minutes of silent thought.

"I'll do it now. Uncle Ned can get along without me. He can hire some one else in my place. I've delayed too long already."

Thereafter the work in the field progressed slowly. Phil's mind was not on his work, and several times he had to repair damages carelessly done.

It was late in the afternoon, and Phil cut the day's work shot by an hour. As he trudged up to the old farm house his face was brightened by the thought of his newly formed plans.

"Hello, Bess!" he called, as a slim girl of sixteen met him.

"You're back early, Phil," Bess replied. "You can't expect supper yet a while. Why, the sun is an hour high."

"Oh, I'm not after supper," the boy sponded. "I've made up my mind to quit for good. Bess, I'm going to the city."

His sister stared at him in amazement for a moment. Phil continued in explanation of his sudden announcement: "I'm going to get a position in the city and leave the farm for good. I've just had a talk with Ed Spencer, and he says he can get me a position when I want it."

"Ed Spencer! Is he home again?" asked Bess.

"Only for a fe wdays. He can't stand it here much longer than a few days at a time—it's so slow. I don't blame him, either, for it is slow—terribly slow and dull."

The boy removed his hat and wiped his forehead.

"But, Phil, if you go to the city what will become of me?" queried his sister, in a weak voice.

"You? Why, can't you stay here with Aunt Matty and Uncle Ned?" There was genuine surprise in the boy's voice, and this was increased when he saw that Bess had turned a shade paler than usual.

"Oh, yes, I suppose I could stay," was the quiet answer; "but did it ever occur to you that I might be lonely, and—and——"

There was a suspicious weakness in the voice, and when it grew husky the girl stopped and turned her face away.

"Why, Bess, I don't see—why, in time I'd take you to the city, too. I'd get a good position and work up in it, and then we'd live there together."

"Yes, but how many years would I have to wait?' resentfully replied the girl. "Do you think Ed Spencer could support his sister? And, if he could, why doesn't he? I'm sure she has a hard enough time to pinch along."

"But," began Phil, in self-extenuation, "I'm not like Ed in some respects, and——"

"No, and I'm thankful you're not," interrupted Bess.

A glow of pride made Phil quiet and more thoughtful. He remembered now that Ed's sister worked hard at dressmaking, besides her duties on the farm, to make both ends meet. In a dim way he seemed to remember several of Ed's selfish ways when they were school companions, and he admitted that he did not treat his sister very liberally. The flash of the roll of bills appeared before his mind, and he wondered if Ed would present his hard-worked sister with some of the money. Probably it was all for her—a birthday present perhaps, for Mandy was sixteen that month.

"Ed, Ed has his bad points," he replied, "and so has every fellow. But he's doing well in the city, and I don't see why I shouldn't do as well. I was always smarter in my studies than Ed."

"Yes, and in everything else," loyally responded Bess.

"Then why shouldn't I go to the city and make something of myself? I can never do it here."

"Phil, I don't think you would do much better," protested Bess. "In a few years now you—we—will have the farm all to ourselves. Uncle Ned and Aunt Matty must turn it over to us—they only hold it in trust until you become of age, you know—and they'll be glad to get rid of the responsibility. Then we can——"

Phil kicked viciously at a stone. This sort of argument did not please him.

"But, Bess, there's no money in farming," he interrupted. "Uncle Ned says that, and everybody else. What's the use of killing yourself on the farm for nothing?"

"But what would you do with it?" gasped Bess in surprise.

"Oh, sell it, or—or let Uncle Ned run it until I become of age. Then"—a new light shone in his eyes—"then the money will start me in business. I'll have the experience, and—and——"

"Oh, Phil!" exclaimed Bess, in a pained voice. "How could you sell it?"

"Why not," stubbornly asked Phil.

Bess did not reply. If he could not understand the sacredness of the associations that clustered about the old homestead she could not make him. She turned abruptly and walked away, but not until Phil saw a tear glistening in her eyes.

"Girls are so funny and—and—unreasoning," the discontented boy remarked aloud.

Phil was strong-minded and determined in his way. Once his mind was made up it was difficult for him to change his point of view. For three years now he had been steadily drifting toward this important decision. He longed for the city and wished to make his mark in a wider field than farming.

"Bess will be terribly disappointed at first," he reasoned, "and she'll be lonely the first month. But she'll soon see the wisdom of my way. When I can take her to the city she will have a happier time of it than here."

Nothing further was said of his change of plans for a few days, but Phil could not fail to notice the change in Bess' appearance. Her face was pale and drawn, and the eyes looked as if she had spent sleepless nights worrying over the matter.

"I wish she wouldn't take it so to heart," Phil reflected more than once. Then a little irritably, "Girls expect so much of brothers. They want to tie them down to their apron strings."

This sort of argument did not tend to convince Phil of his mistaken line of thought.

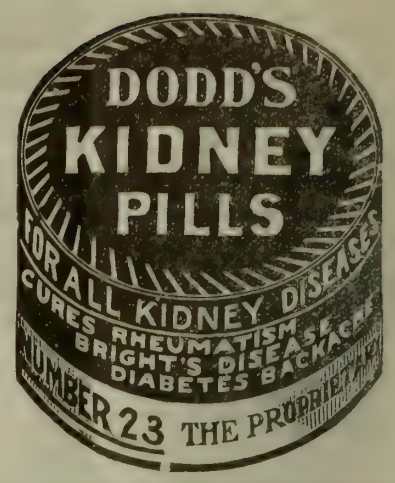
A week later he had fully made up his mind to carry out his long-cherished plans. One afternoon he walked over to the old Spencer home to get Ed's city address. He would write to his old companion and find out what he could do for him.

The Spencer home was a tumbledown, neglected farm of not a great many acres. The only one of the family, in Phil's estimation in the past, was Mandy; but the odds were against her in the uphill struggle, and today Phil's heart beat sympathetically for her.

She was pale and thin, and a worried expression marked her face. At the sight of Phil she flushed and tried to straighten out the stray locks of

BETTER THAN SPANKING

Spanking does not cure children of bedwetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.



HOW MRS. BEAN MET THE CRISIS

Carried Safely Through Change of Life by Lydia E. Pinkham's Vegetable Compound.

Nashville, Tenn.—"When I was going through the Change of Life I had a tumor as large as a child's head. The doctor said it was three years coming and gave me medicine for it until I was called away from the city for some time. Of course I could not go to him then, so my sister-in-law told me that she thought Lydia E. Pinkham's Vegetable Compound would cure it. It helped both the Change of Life and the tumor and when I got home I *did not need the doctor.* I took the Pinkham remedies until the tumor was gone, the doctor said, and I have not felt it since. I tell every one how I was cured. If this letter will help others you are welcome to use it." —Mrs. E. H. Bean, 525 Joseph Avenue, Nashville, Tenn.

Lydia E. Pinkham's Vegetable Compound, a pure remedy containing the extractive properties of good old fashioned roots and herbs, meets the needs of woman's system at this critical period of her life. Try it.

If there is any symptom in your case which puzzles you, write to the Lydia E. Pinkham Medicine Co., Lynn, Mass.

For Preserving, Use

LILY WHITE CORN SYRUP

One-third "Lily White" to two-thirds Sugar, by weight.

"Lily White" Corn Syrup prevents fermentation and mold—brings out the natural flavour of fruits and berries—and makes much more delicious Preserves, Jams and Jellies than you can make with all sugar.

In 2, 5, 10 and 20 pound tins —at all dealers.

THE CANADA STARCH CO. LIMITED, MONTREAL. 278

hair on her head and to arrange her faded dress.

"I've been so busy," she apologized, "that I've hardly had time to fix up decently."

Phil laughed and tried to make her feel at ease.

"I've come over to get Ed's address in the city," he said pleasantly, after a few moments of conversation. "I want to write to him."

"I'm not sure I have it," Mandy replied, blushing deeper than before. "Ed has changed it several times lately. He doesn't seem to stay in one place long."

"I've always heard that they moved often in the city," Phil answered. "I suppose he's rising so rapidly that he has to change every little while to better quarters."

Mandy tried to laugh at this suggestion, but it was a poor attempt.

"Ed is very restless," she ventured finally. "He lost his old position, you know, and I don't know whether he will like his new one."

"No, I didn't know he had lost the old one,' 'returned Phil slowly.

"Yes; there was something that—that—well, Ed is very restless. I wish he was nearer home, so I could look after him a little."

"I think all sisters want their brothers under their wings," replied Phil, with a laugh. "Bess now doesn't want me to go to the city to work."

"Are you thinking of going?" quickly asked Mandy Spencer.

"Yes; that is, Ed said he could get me a position if——"

Mandy dropped her sewing, and with flushed cheeks and sparkling eyes, said vehemently: "Please don't go then, Phil, for Bess's sake and mine."

"Why—what——"

"Well, because—we'll miss you—and then you'll be happier here. Ed is not doing as well as you think, and——"

"I'm not so sure of that. He seemed to have plenty of money with him last week. But I suppose he gave it to you for a birthday present."

"Birthday present! Oh, did you remember that my birthday was last week? I'm so glad. I thought——"

"Didn't Ed remember it?"

Mandy bent over her work and made no reply. She was too loyal to make any confession that would reflect upon her brother.

When they parted a few minutes later she took Phil's hand and said earnestly: "Please do not less Bess—and me. We would miss you so much, Phil."

Phil walked home in an uncertain state of mind. Somehow his desire to go to the city had cooled down, and the sight of two anxious faces made him hesitate.

"Ed is about as selfish as ever," he acknowledged. "A fellow with all of his money who doesn't remember his only sister's birthday is a good deal of a—a——"

He didn't finish the sentence, but he knew pretty well in his own mind what he meant. Suddenly he stopped in his walk. A strangely unpleasant thought occurred to him. Was he also selfish and thoughtless because he ignored Bess's wishes and desires? No; a boy had to make his way in the world even if he did sacrifice the old homestead.

Phil deferred writing his letter to Ed for a full week. Then something happened that made it unnecessary. In one of the city papers there was a small news item tucked away in a corner that greatly excited the people living at Greenville. It was no less than an account of the arrest of Ed Spencer for robbing his employer.

The details of the case were not given, but one could read on the surface the old story of temptation, weakness, and final failure. Phil's heart nearly stopped beating. He could not show the paragraph to Bess, and in his heart he hoped that no one in Greenville would see it.

But this was a foolish wish, for within twenty-four hours the news had spread all over the village and the farming section. Phil thought of Mandy. How would she take it? How would Bess take it if he were the prisoner?

"Oh, Phil, suppose it had been you!" exclaimed Bess when she heard the news. Then, blushing deeply, she threw her arms around his neck, and stammered: "But of course I know it couldn't have been you."

Nevertheless she sobbed rather nervously for a few minutes, until Phil was tempted to say:

"I don't know, Bess, I—I might have fallen, too. Who knows?"

"No no!" protested Bess loyally.

Phil picked up his hat and strode toward the door.

"Where are you going?" she asked.

"I'm going over to see Mandy," was the reply.

Without further explanation of his sudden resolve, he walked across the fields until he reached the Spencer home. Without waiting for any formality, Phil entered, and caught the girl curled up in a heap, with her sewing scattered in a hopeless mass round her.

"Mandy!" he said softly.

She raised dull red eyes to his.

"Mandy," he repeated, "I'm going to the city."

"Oh, Phil!" she cried.

"I'm going," he continued, "to see what I can do for Ed. Then I'm coming home to stay."

"If Ed had only stayed," she moaned.

"He will come back—in time," Phil replied.

The girl raised her head and laughed hysterically. "Yes, now he will come home," she said wildly, "and nobody will have anything to do with him. He won't be able to get work again, and we—we shall have to move away."

Phil twisted his hat nervously, but his voice was clear and firm when he spoke. "He will always be the same to me, Mandy, and if—if he'll work on the old farm with me he'll never lack employment. I'm going to stay on it, and keep Ed, too. Maybe in the end it will be a good thing for both of us. We'll make better farmers for the—the experience.

Something like a hopeful expression entered the stricken girl's eyes.

"Phil, if—if you could bring him home now, I—you know, they're not going to drosecute him? Mr. Barrows has discharged him, but he will not have him imprisoned for the—the——"

"I understand," Phil replied. "I shall bring him home right away, and we'll run this farm together."

The door suddenly opened, and Bess appeared on the threshold.

"Bess!"

"Mandy!"

And the two girls were sobbing in each other's arms. Phil looked on with wet eyes, and then whistled softly.

"I guess," he said finally, "with two such sisters, Ed and I ought to keep straight. If we don't, we deserve something worse than a thrashing, and I'll be the one to do the licking."

"Why, Phil, what are you saying?" demanded Bess, wiping her eyes. "You've been takling to yourself while we—we were——"

"Acting like two silly school girls," prompted Phil. "But I'm off now. I'm going to the city, Bess—going at last."

"To stay?" demurely asked Bess.

"Until I can bring Ed home," responded Phil, as he pulled the door softly shut behind him.

EATING AND DRINKING

It seems to be a well-established fact that, as a rule most of us live to eat rather than eat to live. If we would but change about there would be a vast increase of health, prosperity, and happiness throughout our land today.

It takes a little self-denial and a good deal of backbone to cut out these foods of which we are fond, but which do not agree with us, even though we know the result will be a headache, sick stomach, or some kindred ill.

A lady of my acquaintance, who is very fond of the good things of life, will come home with a supply of candy, fruit, fancy cakes, etc., and sit down for what she calls a "feast"; then, when it is over, she will laughingly cry: "There, I expect I'll be sick tomorrow, but I will take a pill tonight!" Half her days are spent either in bed or on the couch, while her husband works early and late to pay the bills for doctors and hired help, and a hired girl rules supreme in the kitchen because the mistress of the house is not able to overseen even the arrangements of her house and home.

Long indulgence in highly spiced, over-rich foods has given us a perverted appetite, and so we go on catering to it and paying all we earn, or nearly all, to the doctor and the druggist. And when overworked Nature calls a halt, and some morning we get us sick and faint, our stomach rebelling at the mere thought of food, instead of following the right course and giving it a chance to rest, we immediately set to work to think up something new to "tempt the appetite," and the inevitabl result follows that, instead of an illness of perhaps a day or two, while the overworked forces of the system are recuperating themselves, we spend days of sickness and pain, if nothing more serious intervenes, before we regain a part of our former strength and activity. It won't hurt anybody to go without a few meals, drinking plentifully of hot water in the meantime, for it is Nature's own remedy and is by far a better medicine in most cases than drugs.

Most of us get to the point where we do not feel satisfied unless we are overfed.

"Do you know," a young woman said to me yesterday, "that when mamma was sick last week, and I had the work and cooking to do outside of office hours, I really didn't have time to eat as much as usual, and I felt fetter, in spite of the worry, than I have for a long time. My work even went better. I seemed clearer-headed, lighter, some way, more fit. But this week mamma is doing the cooking again and every-

COWAN'S Queen's Dessert

A Pure Vanilla Eating Chocolate

Little Miss "MAIDEN" CANADA

For our Heroes——

At times during heavy bombardment the army commissariat becomes so disorganized that ordinary food is unprocurable for days.

During such times as this the value of a convenient and concentrated food that may be carried and handled easily, cannot be over-estimated.

Queen's Dessert Chocolate answers all the requirements of such a food. It is the most nourishing and wholesome chocolate manufactured. If you are unable to obtain this chocolate in your locality, write us, we will see that you get it.

Sold in 5c. and 10c. sizes.

CHAMBERLAIN'S TABLETS

PRICE 25¢

Keep Your Bowels Clean

Month's treatment in a package. 22

GOT DIARRHOEA FROM DRINKING BAD WATER.

People moving from one place to another are very subject to diarrhoea on account of the change of water, change of climate, change of diet, etc., and what at first appears to be but a slight looseness of the bowels should never be neglected or some serious bowel complaint will be sure to follow.

The safest and quickest cure for diarrhoea, dysentery, colic, cholera, cholera morbus, cholera infantum, pains in the stomach and all looseness of the bowels is Dr. Fowler's Extract of Wild Strawberry.

Mr. Ernest Jeffery, Moose Jaw, Sask., writes: "A few years ago, when I first came out to Canada, I went to the harvest field to work. Somehow or other the water did not agree with me. I had the darrhoea so bad that blood was coming from me, and I thought my last days had come. One of the harvest hands advised me to take Dr. Fowler's Extract of Wild Strawberry, and before I had used the bottle I was able to go to work again. My advice to all is always keep a bottle of this wonderful diarrhoea cure on hand."

"Dr. Fowler's" has been on the market for the past seventy years, and has been used in thousands of Canadian homes during that time, and we have yet to hear of a case of bowel complaint where it has not given perfect satisfaction.

The genuine "Dr. Fowler's" is manufactured only by the T. Milburn Co., Limited, Toronto, Ont.

Price, 35 cents.

thing tastes so good I am eating all I can hold, and it's the same old story. I'm loggy and lazy and dull."

And it is exactly so. Nine-tenths of the sickness of today is, I believe, caused by overindulgence in eating and drinking those things that appeal to our taste, but which for the most part merely overtax the system, resulting in a slow poison which deadens the faculties, saps the strength, undermines the constitution and leaves us fit subjects for disease.

If you, busy housewife, will cut out the rich pastry, the highly spiced, indigestible foods, and substitute instead good plain nourishing homely fare, spending part of the time thus gained in an honest study of food values, you will find the health of each member of your family will improve, as well as the happiness of your home increase, for good health brings happiness close in its trail.

Chew every mouthful of food thoroughly until it becomes a liquid and disappears without volition of your own. Talk it to the older members of your family, and teach it to the children. You will find you do not require as much as when you eat hastily, only half masticating your food, and very soon you will not miss the sweets, as the system becomes better nourished and accustomed to the change. The taste will gradually become once more normal and natural, and you will enjoy your plainer fare as much as you did the former one.

Few of us drink enough water, and far too much tea and coffee. If you must have (or think you must) tea and coffee, be sure they are freshly made each time of serving, and never allowed to stand from one meal to another; and do not deglect to wash and scald the pots in which they are made after each using.

If you would be in the very pink of condition, do not drink any alcoholic drinks whatever. In a recent article by Dr. Cabot, he classes them as simply a form of drug, and one of the worst. Drink plenty of water between meals. Eight or ten glasses a day is none too much. It will save many a doctor's bill. Teach the children that it is necessary to their daily lives. Eat much fruit, for it supplies the system with the natural sugars and salts which it requires, as well as enriching the blood and filling the whole being with new vigor and power.—L. D. Stearns, in Maine Farmer.

PILES CURED at HOME by NEW Absorption Method

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

FIRST AID TO THE INJURED

That "a little knowledge is a dangerous thing" is an old adage of considerable truth, but the occasion may arise when some knowledge of the first aid to the injured will not only relieve suffering, but be the means of saving a life.

So important has become this kind of training that the corporations and large industries where life and limb are constantly in peril are training first-aid corps at considerable expense. First aid is not intended to replace the doctor and I must warn you to not depend upon what bit of knowledge you may have acquired to direct the treatment of other than the very simple little injuries.

First aid is the doctor's assistant, and the good results from this knowledge are frequently not so much what is done as what is not done.

Injuries and wounds that are sterile are very often infected through ignorance. The loss of a little blood may be of no consequence as compared to the dangers of blood poison from binding up the injured member in a soiled handkerchief. Many times have workmen removed a germ-laden chew of tobacco from the mouth and placed it in a cut which was made by a tool with a polished blade practically free from germs. Cobwebs were famous in the olden days to stop bleeding, and yet it has been discovered that the germs of lockjaw are very frequently found in them.

When the skin is broken the gush of blood will frequently wash away the infected matter and the wound be practically sterile, until some smypathetic soud, with a heart much bigger than his knowledge of asepsis, literally fills the wound with germs in an effort to stay the crimson flow.

Unless you have been trained to a knowledge of what to do and what not to do, you had much better keep hands off.

Germs are sociable creatures, and the dangerous kinds are rarely found except in the social centres. For this reason injuries in cities are fraught with greater danger of serious complications. If those living in the country do not escape many of these complications it is chiefly because of meddlesome treatment through ignorance of the use of asepsis and antiseptics.

An antiseptic is a substance that will kill or hinder the growth of germs. Many kinds are used by doctors, and all of them are poisonous when taken internally.

To sterilize is to destroy the germs, and this can be accomplished either with antiseptics or by boiling. Anything that has been well boiled for a half hour is sterile and will remain so until it has been reinfected by careless handling or exposure. It is useless to sterilize a bandage if it is to be immediately infected by unclean hands.

Surgeons have leanred that hands cannot be perfectly sterilized, and all operators now wear rubber gloves that can be boiled.

I have known men in the harvest field to tear the sleeve out of a sweaty shirt to bind up an injury, and by so doing maimed for life the unfortunate victim by infecting him with the germs of blood poison which otherwise he no doubt would have escaped. A much better treatment would have been to allow the bleeding to cease of its own accord, leaving the wound exposed to the air until the doctor arrived.

It is not easy to bleed to death. But if the flow of blood is too abundant the emergency must be met with the means at hand. If a serious hemorrhage occurs in the arm or leg a band or handkerchief should be placed above the injury, near the hip or the shoulder, and a stick twisted in it, making pressure until the bleeding is controlled. Small cuts and wounds should have tincture of iodine painted into the wound and bound with a sterile bandage or old muslin that has been boiled.

The rusty nail bears a nasty reputation in the country, and the punctured wounds it leaves are very dangerous because the rough surface of the nail carries the dirt and germs into the deep tissues, making it difficult to cleanse. Never put a poultice on such a wound. It is the one thing you should not do. Nothing can draw the poison out of the wound, for there is no poison to draw out other than the germs, and a poultice ony aids their development by shutting out the air. If you must do something, pour the wound full of tincture of iodine. If in a few days it becomes painful and inflamed, go at once to a good doctor.

For a bruise nothing can equal hot water. Almost boil the injured part for one or two hours at a time by placing it in a hot bath, repeating it several times a day. You cannot use too much of it. It is tiresome work, but it will give results. Liniments have a very limited usefulness, and many times they appear to delay recovery.

Burns should be covered with baking soda or oil of some kind, and if it is a large and serious one a mixture of linseed oil and lime water makes a suitable and soothing application until you can get medical aid. If a bone is broken sticks should be firmly tied along the limb to prevent further injury to the flesh in moving the person.

Boils require heat and moisture to bring them to a head, and nothing is more suitable for this than a poultice. The requisites for a good poultice are nothing more than heat and moisture. The kinds of material of which it is made are of little consequence so long as it is large and kept hot.

In the care of all kinds of injuries, remember that nature will effect a cure provided the germs are kept out or their growth controlled. The best way to keep the germs out is to keep soiled hands and dirty rags away from water and soap, using a nail brush libthe injuries. Hands washed in hot water and soap, using a nail brush liberally until thoroughly scrubbed, rinsed in plain water, and then well rubbed with alcohol will be prepared for dressing an injury. After the dressing the same process should be repeated to protect the one doing the dressing from a possible infection.

Never seal up an injury so that the air cannot dry the secretions. Adhesive plaster covering a wound retains

BY APPOINTMENT TO H.M. KING GEORGE V

"My Treasure Book"

Until Mappin & Webb opened a store of their own in Montreal, the woman who possessed a copy of their English catalogue counted herself as of the elect. It was her choicest possession—a rare edition—eagerly consulted—jealously guarded—because so few of these found their way to Canada.

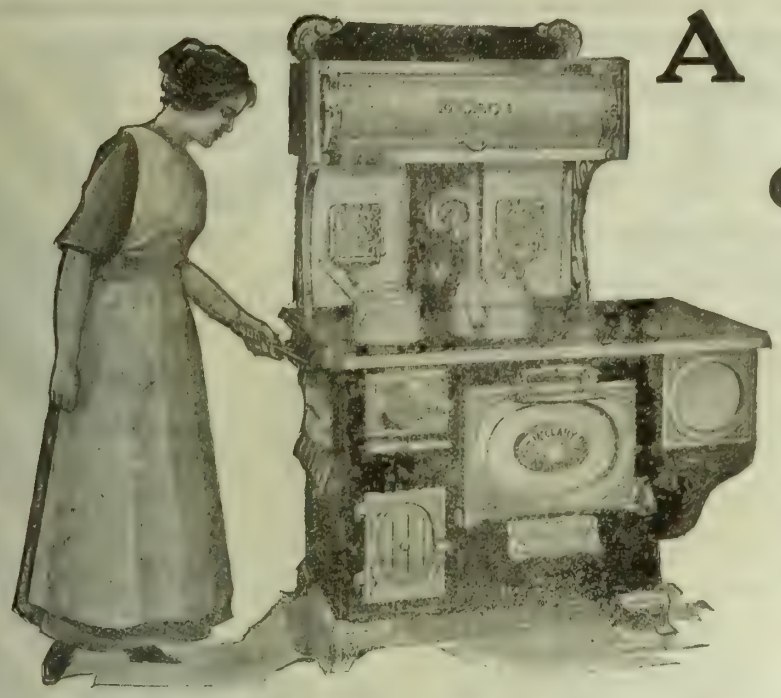
With the opening of the Montreal store, a different policy has been pursued.

Instead of one large "Treasure Book" issued once a year, a number of seasonable catalogues are arranged, each one complete in itself and showing the choicest, the rarest and the most substantial in Jewellery, Precious Stones, Gold and Silverware for the individual season.

Our latest catalogue — and a very beautiful one—is ready for distribution. May we send you a copy?

Mappin & Webb CANADA LIMITED

353 ST. CATHERINE ST. WEST, - MONTREAL.



A range you can easily control

IT is wonderfully simple and easy to regulate both your cooking and the expenditure of fuel,—money. And easy to manage, means easy to economize, you know.

All the Kootenay controls are on the outside. For instance, how infinitely easier to control the damper from the front of the stove—the Kootenay way—than to bend over the hot top to reach it! Surprising how quickly one gets almost complete control of every bit of heat, making it do your bidding. You keep an eye on the thermometer, and the smokepipe fuel saver, handy dampers, and on the oven that loses no heat; all work together for splendid cooking at least expense.

You want to know about the sensible ideas for saving time, the fine bakings you can do with a small amount of fuel, and the way the range withstands the wear and tear that wrecks ordinary ranges; its aluminized flues mean long life to the range because the coated steel linings are rust-proof; asbestos joints prevent leakage of air at joints.

McClary's Kootenay Range

The new booklet, just off the press, tells everything in an interesting way. Tear out the coupon and send it to the factory. Before you forget, and certainly before you buy a range, get your copy.

McClary's

the moisture and favors germ growth, whereas if it is wrapped lightly with gauze or thin muslin a scab will form, shutting out the germs.

Wounds from gunpowder and explosives are usually best cared for when eft exposed to the air, and because of their serious nature they require very careful treatment. It is unsafe for you to attempt to care for them. Go at once to the best surgeon you know, or to a good hospital.

In the treatment of all kinds of injuries, remember that germs cannot multiply except when moisture is present. Do not forget that all pus is due to germ growth. Heat and hot applications favor pus formation, while cold retards germ growth, and therefore tends to prevent the formation of pus. —J. J. Clarke, M.D.

POTASH IN WOOD ASHES AND FELDSPAR

Hardwood ashes contain from 18 to 46 per cent of potash, while ashes from conifers contain from 14 to 20 per cent. The yield of ashes from wood is about 1.6 per cent in weight, and one cord of wood weighs approximately 2,100 pounds. Assuming that four-fifths of the potash in the ashes is leachable, the amount of wood containing 15 per cent of potash is four pounds.

The present price of potash in trade centres in the United States is nominal. The rate per ton is quoted at from $400 to $500, but none is available. The price for the most common form, the muriate, or chloride, containing 80 per cent of the pure salt (equivalent to 52.7 per cent of K2O) was $38 per long ton in July, 1914.

Canada possesses many deposits of feldspar with potash contents ranging as high as 15 per cent, thus constituting a considerable resource of potash if an economical process of extracting it can be developed.

Several chemists are actively engaged upon this problem in the United States. Chemically it has been solved, but capital is still hesitant about investing heavily in any of the dozen promising methods which have been worked out on a scale little beyond simple laboratory experimentation.—W. J. D.

HOW TO PREVENT FIRE

Keep waste paper, packing material, and rubbish cleaned up.

Make frequent personal inspections from a fire standpoint

See that your electric wiring is standard, and be careful in the use of electric devices.

Have all smoke pipes and chimneys inspected and properly repaired before starting fires for the winter.

Be careful about the use of matches. Provide safe receptacles for them both before and after use.

Feel your personal responsibility as to possible loss of life and property by fire, and act accordingly.

KEEP AWAY RUST

When machines are laid up for a time, such as farm machinery, the parts not actually painted should be coated with a rust preventative. Such a substance should have the qualities of cheapness, ease of application and removal, and not be injurious to the coated surface.

A good and inexpensive coat may be made by mixing flour with common machinery or lubricating oil. This mixture should have a consistency of thin paste. It may be applied with a paint brush. The flour keeps the oil from drying hard, and the oil will prevent the air and moisture from coming into contact with the surface of the parts treated, thereby preventing rust or corrosive effects.

KEEP COWS COMFORTABLE

I have seen cows turned into the pasture without a sign of shade trees or anything else with possibly a pond or creek filled with sluggish water where they will stand and drink and fight off the flies. Such conditions as these are deplorable and are bound to result in a decreased flow in the milk which if brought back again at all will be at considerable expense. Good cows can be made poor milkers by such treatment. To keep the cow in the best of health and enable her to produce good pure butter fat she must have an abundance of fresh water.

FEET OF HORSES—THEIR STRUCTURE AND CONDITION

(Continued from page 734)

his feet be treated in order to minimize danger of disease?" Practically all that the driver can do is to see that the shoes are removed and reset at periods of four to six weeks, according to weather and general conditions.

In the interim he should clean out the sole of the feet once or twice daily, and when necessary supply moisture. Moisture, and plenty of it, is necessary to keep the feet in a healthy condition. During wet weather or where horses are on pasture at night, sufficient moisture will regualrly be gathered from rain and dew, but during hot, dry weather horses that are kept in the stable must in some way have moisture supplied to the feet, else they become dry, brittle and hot, have a tendency to contract and cause or predispose to disease.

Many kinds of hoof dressings are on the market, but it is doubtful that they do much good other than improving appearances. Water is what is needed and this must be regularly supplied. This may be supplied by soaking pads, poultices, standing the horse in a tub of water for a few hours daily, standing him in wet clay or running water, or stuffing the feet with clay, rock or other substances that retain moisture for considerable time.

Any way by which either the wall or the sole may be kept in contact with water for at least a few hours daily gives good results. As a means of lessening concussion in horses driven on hard roads, the wearing of rubber pads answers well, but these should not be worn constantly, as they tend to prevent admission of air to the soles and to cause disintegration of frog and sole.

In a few words, we say: Keep the feet level and in as natural a shape as possible. Shoe so as to give even pressure on the wall and junction of wall and sole, and if possible on the frog. Keep sole and frog free from foreign matter, supply moisture, and have the shoes removed in, at most, every five or six weeks.

PURE BRED COW WILL GIVE GREATER PROFIT THAN GRADE

(Continued from page 723)

equal quality. Although profit is the prime requisite of a good dairy herd, it is not the only one. There enters into breeding and rearing of live stock a certain element of refinement. Drive through the country and you can usually locate the farms on which pure-bred stock is the specialty. As it is with the farm, so it is with the man who breeds pedigreed stock. There is a fascination about developing young stock. What type of offspring will a certain mating give? This fascination ripens into pride when one of your own breeding brings a long price in the sale ring or draws a ribbon in the show ring, or perhaps one of your heifers makes the advanced registry with a fine record. When a man is conducting a reliable business, making a good living and a fair profit, when he is able to sell his stock to his best neighbor at a good price without a twinge of conscience, knowing that what he sells is as good as the best, then he comes nearer to realizing the meaning of the word "satisfaction" than does the millionairse whose wealth is the result of child labor in a sweatshop.

A raised platform for the water pail will insure a clean water supply in the poultry house. Water dishes placed on the ground are soon scratched full of litter and this may result in sick birds. Scalding the water dishes at least once a week will pay, and may prevent cases of sickness during hot weather.

EATON'S

COMING!

OUR BIG FALL & WINTER CATALOGUE

ARE YOU ON OUR MAILING LIST?

The biggest and best **EATON CATALOGUE** is about to be issued. Almost all of your everyday needs are listed in this big book, and the prices we quote are of more than usual interest because of the pronounced saving they afford. If you do not know **EATON** values, or for some reason you have not bought regularly from our Catalogue, we ask that you make sure you get this latest book. We want the **NAME AND ADDRESS RIGHT NOW** of those who have not received **EATON'S** Catalogue during the last six months. A copy will be sent you before the end of August if you

PLANTING WITH DYNAMITE

Hardly a week passes that we do not receive some contribution to the sum of experiences of those who test the advantages of tree planting with plow and spade as compared with the trees for which the holes have been blasted with dynamite.

These experiments are always of interest, and we shall be glad to hear from any of our subscribers who are gathering experience along this line. Up to date the evidence is in favor of the dynamite-planted trees. "The old order changeth, giving place to new," not because it is new, but because it secures better results. The latest information we have on this subject is especially valuable as coming from T. M. Gathright, a well-known soil expert. He says:

"I used dynamite in preparing for planting on the properties of the Virginia Crown Orchard Company. Several thousand apple trees were set in holes prepared by blasting, and several thousand others where the holes were dug.

"These plantings were made three and four years ago. In June, 1915, the trees set with dynamite appeared to be at least two years older than those where dynamite was not used.

"From my own experience and observation, I would not consider planting any kind of tree without first blasting the soil."

This is strong endorsement, and growers who are still unconvinced that the new method is preferable to the old can easily put it to the test. Of course, the claim of the dynamite enthusiast is that the plow and spade fail to break up the soil deeply enough to give the roots a chance to grow without a devitalizing struggle, and that the dynamite prepares the ground properly to store moisture and makes better drainage.

KEROSENE EMULSION WILL "GET" PLANT LICE

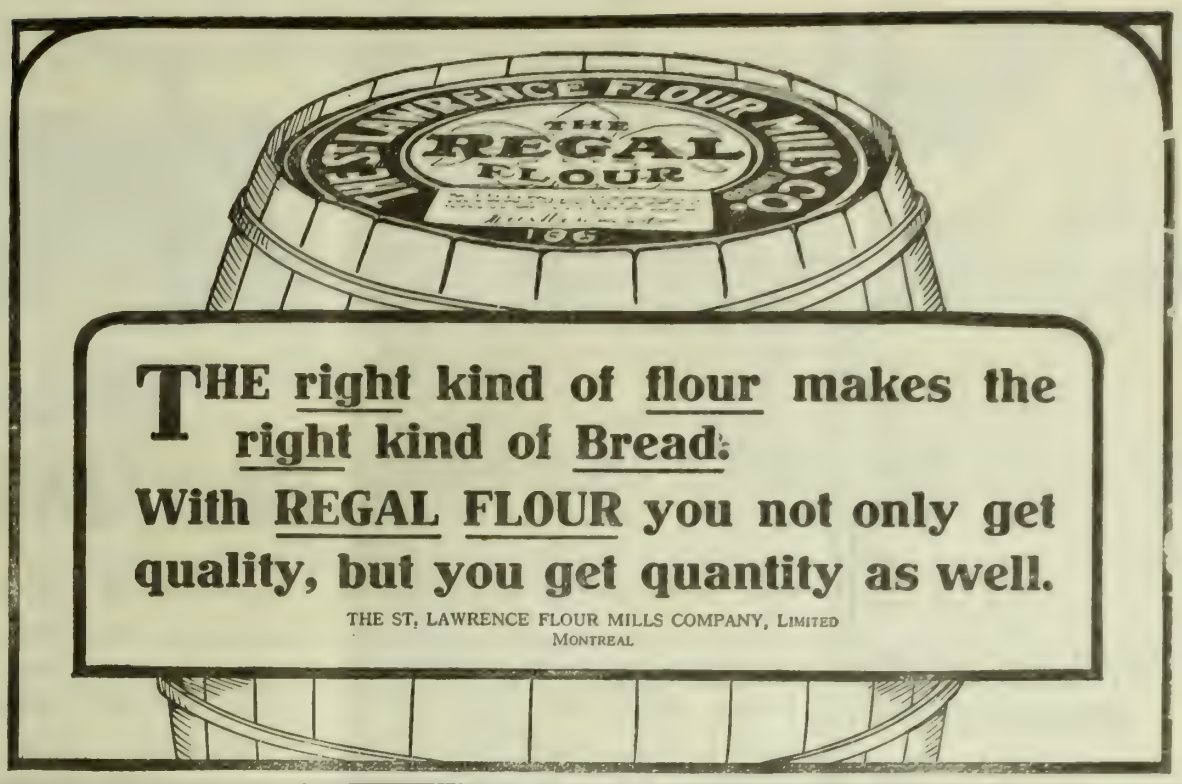
The cheapest, if not the best, of the insecticides that may be used for the destruction of plant lice upon the foliage of garden plants, shrubs, or trees is kerosene emulsion if properly prepared.

To make a good emulsion use soft water and any cheap laundry soap, and prepare as follows:

Dissolve one pound of soap in one gallon of water and heat to the boiling point. Remove the soapy solution from the fire and add two gallons of kerosene and immediately agitate the mixture as briskly as possible, either by means of a small force pump to drive the liquid back into itself in the bucket or by some other method. When thoroughly emulsified, which should be within two or three minutes after the agitation is begun, dilute to 30 gallons with soft water, and apply. In small quantities the emulsion is easily made by the use of an egg-beater. As this preparation kills only by coming in contact with the insects, care must be taken to throw it forcibly so as to strike tehir bodies.—C. P. Gillette, Colorado Agricultural College, Fort Collins, Colorado.

CALCINED BONES FOR FOWLS

Bones are valuable for feeding laying hens and growing chicks, principally because they contain lime and phosphorus. Raw green bones also contain protein and fat, but the bone meal of commerce has had these elements of nutrition boiled out of them before they were ground. On almost every farm there are bones lying around bleaching in the sun, an eyesore to every one. If these bones are gathered up and calcined by burning them in a pile of brush or other refuse until they are brittle and easily broken they make a very valuable feed for fowls. Burning does not change the lime and phosphorus in the bones.



ST. LAWRENCE FLOUR MILLS CO.
THE
REGAL
FLOUR
THE right kind of flour makes the right kind of Bread:
With REGAL FLOUR you not only get quality, but you get quantity as well.
THE ST. LAWRENCE FLOUR MILLS COMPANY, LIMITED
MONTREAL

I feed my hens the meat from fresh beef heads. The bones from these heads are calcined until they are thoroughly charred in the furnace used in cooking the heads. Then it is an easy matter to break them with a hammer, using a flat stone on which to break them. They are broken until a hen can swallow the smallest fragment and are eaten greedily. Some parts of the bones are charred, and this charcoal is as good as any other in absorbing gases and correcting acidity in the stomach. By using these bones I save the cost of buying them at about $3.50 per cwt., and obtain a better feeding material than the cracked bone sold in the stores.—Miller Purvis.

ADVERTISING TO HELP SALES

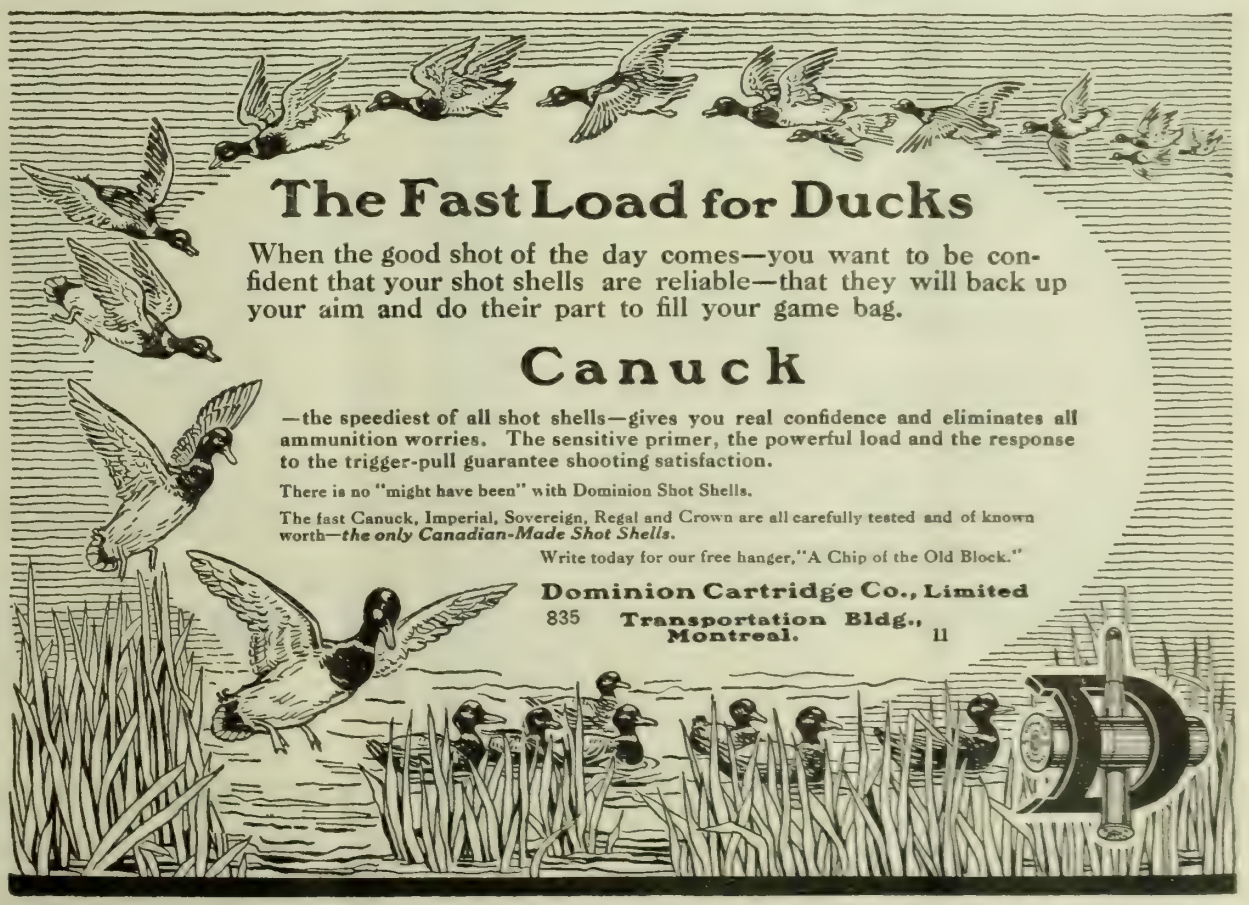
I have solved the marketing question by bringing the market to my door. When my chickens reached the proper size I advertised in the local paper, which brought customers right to my door. Now I buy up young chicks of my neighbors, put them in a large shady pen, feed plenty of grain and green stuff, and keep fresh water before them at all times, thereby insuring good health. In this way I am able to market those which are fat and free from vermin.—Mrs. J. Martin.

BUTTER MAKING IN SUMMER

No other one factor is so important in producing good butter in summer as proper control of churning temperature. When cream has been correctly soured it should be cooled down to the approved temperature for churning and held at that temperature at least two hours, to allow the fat to become cool and firm enough for proper churning. Churning temperatures vary widely, but much farm butter is made at too high temperatures. It is never advisable to churn warm cream, because it is necessary to cool the butter with ice water or very cold water before it is worked. The result is loose, calve-like butter.

At the time of year when cows are fresh and feeds succulent the butter fat is naturally softer than later in the season; hence a lower temperature, or from 52 to 56 degrees, should be used. Experiments at the Pennsylvania state college see mto indicate that the lower temperatures are to be preferred, as the butter is firmer when it comes from the churn, does not easily incorporate buttermilk, and will stand more working. Thorough working produces a better body and more uniform quality. Under average conditions cream should require from 20 to 30 minutes to churn. A shorter period indicates that the temperature is too high, the result of which will be inferior butter.

The farmer nowadays is too busy to listen to brass-band publicity, but he always has time to read bracc-tack advertising.—The Farm Journal.



The Fast Load for Ducks
When the good shot of the day comes—you want to be confident that your shot shells are reliable—that they will back up your aim and do their part to fill your game bag.
Canuck
—the speediest of all shot shells—gives you real confidence and eliminates all ammunition worries. The sensitive primer, the powerful load and the response to the trigger-pull guarantee shooting satisfaction.
There is no "might have been" with Dominion Shot Shells.
The fast Canuck, Imperial, Sovereign, Regal and Crown are all carefully tested and of known worth—the only Canadian-Made Shot Shells.

More Money in Milk

The amount of milk that a cow can give, depends, first, on the *breed*—and second, on the *feed*.

But—make no mistake about this point—a blooded Holstein fed on turnips, mangels and hay will have a hard time to keep up to an ordinary, scrub cow, carefully cared for and fed either a balanced ration or one containing an excess of *Protein*.

The right feed means big profits. Ordinary feeding means small profits, or none at all. Our book on

EDWARDSBURG Gluten Feed

Guaranteed 23% Protein

shows why it is a real economy to pay the price for a feed rich in protein—shows the profit you make in the increased quantity and quality of the milk which the cows give when their rations are balanced with Edwardsburg Gluten Feed.

Write for a copy of our book and study these interesting feeding facts—the book is sent free on request. 302

DROOP IN RUMP OF JERSEY CATTLE

The following article was presented to the Jersey Bulletin by Mr. Robert Wylie, a Jersey breeder of Ohio, taken from his thesis on "The Relation of Type and Conformation to Production in Dairy Cattle," which was prepared as a requirement for Mr. Wylie's master's degree at the University of Missouri last year:

Probably no one point of conformation has been given more attention by breeders of Jersey cattle than the droop of rump. In the show ring an animal possessing a rump that does not carry out fairly level is generally discriminated against, and breeders have set forth as the idea type of Jersey cow one that carries out level in this region. In order to determine whether there was any relation between the droop of rump and the production of cows, the author measured ninety-six Jersey cows holding yearly records. These cows belonged in the same cow-testing association, and their records were made at approximately the same period of time. The range in production was from 121 lbs. to 537 lbs. of butter fat. The purpose of measuring cows in a cow-testing association in preference to Register of Merit cows was to do away with extremes in the conditions under which the records were made, and at the same time to get some cows having ow records.

It was found that the cows with the greatest droop of rump had a higher average production than the cows with rumps that carry out level. Especially was it true that those cows with rumps that approached nearest the ideal of the breeder were low producers on the average. Some of the cows with the largest records had the most drooping rumps, and some cows with the most level rumps had low records. On the other hand, some cows with level rumps had high records, and some with drooping rumps had low records. There appeared to be no relation whatever between the droop of the rump and the production of individual cows, but when records of a number of cows were averaged together those cows with the most level rumps had the lowest average production.

It is not the purpose of this article to say definitely that cows with drooping rumps are always better producers than cows with level rumps, but to show that this point of conformation has in many cases been perfected to the breeders' satisfaction at a sacrifice to production, and that the prejudice against cows with rumps that do not carry out level is not warranted when their production is considered.

THE EXPERT MILKER DOES HIS WORK WITHOUT FRICTION

The art of milking is to do the job comfortably, to keep the cows in good condition, and to get the highest possible yield.

The expert milker is a born animal trainer. He is even-tempered and not easily provoked. He gets along with his beasts without friction by gentling them. Lactation is a nervous function, and any disturbance of a cow's placidity results in a shortage of yield. Peace in the herd is a paying investment. It is not a matter of sentiment but of hard dollars and cents. To be profitable the cow must be contented.

The expert milker is also made by training and study. There are "tricks of the trade" which some gain by experience and all may learn by example. Regularity is important. The cow is a creature of habit. If feeding is delayed she frets and takes it out of her owner by giving less milk. She will do better if she is milked at the same hour every day.

All things considered, it is best to feed after milking. The cows stand more quietly, usually chewing the cud, and there is less dust in the air to contaminate the milk. Scientists declare that most of the milk is elaborated during the milking process and that a good supply of blood should flow to the udder at this time. The excitement of being fed draws the blood away from the udder and may prevent the highest flow.

comfortable milking ts oolamekIf,

A comfortable milking stool makes the job less arduous. Have the milking stalls clean. The use of a closed pail having the top fitted with a wire strainer which is packed with steril ized absorbent cotton helps in the pro duction of good flavored sanitary milk.

The farmer who desires a clean product that will keep well will wash the teats, udders and flanks of his cows before milking. Dirt is not only disgusting but dangerous—and expensive. It carries bacteria that cause milk to spoil quickly and sometimes contains disease germs as well. The hands should be kept clean, the nails trimmed closely, and the abominable practice of wetting the hands with milk should be condemned by all decent dairy men.

While it makes little difference which teats are milked first, it is more convenient to milk one front teat and opposite hind teat at the same time. The process should be continuous and rapid without feverish haste. Long, steady pulls get the milk faster and with less annoyance to the animal.

If the teats are short, or the hands tire easily, the "Swisss tyle" of milking is recommended. It consists in flexing the thumb against the palm with the nail side against the teat, pressing the four fingers against the opposite side and squeezing down from the top. It may take a little practice to learn this trick, but it is worth all the patience and effort necessary, as one can milk faster and with less fatigue. The writer employs this method with all cows except those having very large teats.

It is important to empty the udder at every milking. Nothing will dry up a cow more surely than to leave a little milk each time. Nature takes it as a sign to let up the supply, saying in effect: "The calf is eating grass and will soon be weaned." You must fool nature into thinking the calf is still there with a husky appetite, taking all the milk the dam can manufacture. The most profitable cows are those which do not dry up quickly but give milk all the year round.

Stripping with the thumb and forefinger is only one way to get the last of the milk, which is the richest in butter fat. The Danes, who are leaders in good dairy practice, have a way of kneading the udder with both hands, gently pressing down from above first at the sides and then front and back. After kneading for half a minute follow with a final stripping. The calf butts to get the last drop, and this manipulation is only another imitation of nature.

Vaseline or some good ointment should be used frequently to keep the teats soft and to heal up scratches.

THE DRAFT OF PLOWS

(Continued from page 724)

onstration is worth a hundred articles on the subject. What effect do dull shares and coulters have on the draft? How much does the lead team pull when plowing tandem? Do the different makes vary to any extent? Questions like these should be answered at the local plowing match. I feel sure implement men would co-operate, and the writer's experience has been that such a demonstration is highly profitable and instructive to all. Readers wishing to go further into this question ca nget valuable information from "Power and the Plow," Ellis-Humely, and in King's "Physics of Agriculture." —Grain Growers' Guide.

SHIP POTATOES IN SACKS

In a recent address President C. H. Gardner, of the Maine Farmers' Union, plainly told farmers there are two things they should do if better pric s for their produce—notably potatoes—are secured. In the first place, there must be a better system of grading, local unions shipping only those goods which they can stand behind. In the second place, Mr. Gardner believes potatoes should be shipped in sacks instead of loose or in bulk in cars. When shipped in bulk there is always a comeback through shortages; misunderstandings and dissatisfaction between dealers and growers are pretty apt to result. While it takes some time to sack potatoes, the operation must be performed somewhere between the grower and the consumer. Mr. Gardner says truly that the country end is the proper place to do it. It will facilitate handling, especially if potatoes are brought under the auction system, not to mention the elimination of the long train of complications that shipping in bulk brings. Potato growers should carefully consider these points of President Gardner, for he knows what he is talking about.—New England Homestead.

STRAWBERRY PLANTS

For the Spring of 1917 we are listing the following varieties:

Senator Dunlap, Sample, Warfield, Wm. Belt, Arnout, Valeria, Desdemona, Ophelia, Portia, Glen Mary, Buster, Haverland, Kellogg's Prize, Paul Jones, Progressive, Superb.

Our new Catalogue and Price List will be ready about the first of the year, and will be sent free to all our old friends and any new ones that are interested in berry growing. The new fall bearer, Progressive, is a great addition to the strawberry world. Be sure and include them in your order for 1917.

Establishing and Maintaining a Farm Flock of Sheep

Roscoe M. Wood in Breeders' Gazette.

It requires a firm faith founded on practical experience and knowledge of handling sheep for a farmer to establish successfully a pure-bred flock in his community. He must believe in the wealth-producing power of the golden hoof, and he must fully realize the necessity of supplying such a flock the best care and the proper feed. If he prove a successful breeder, in addition to these will develop a knowledge of breeding and of how to mate animals to produce desired results. The growth and development of a live stock breeder is not the work of a day nor a year—a lifetime is all too short.

No farmer should attempt handling pure-bred sheep, nor any other class of live stock, except sires used, before he has thoroughly acquainted himself with the requisites for producing thrifty, growthy, profitable animals. Such experience is most economically obtained with animals produced for the general market. He must learn that while sheep will eat weeds and clean up fence corners, woodlots, and stubblefields, they also require clover hay, grain, and roots at certain seasons. Like everything else in this world, the flock must be given care if it is to provide for its keeper. The better care and feed it receives the greater will be the profit.

In starting the flock the question of breed must be determined. While the individual preference should be followed, yet choice should be made in accordance with the condtions of soil, climate, and market. The experience gained from handling the market flock will have been instructive in teaching the characteristics required to produce the most profit, so that the breed which best combines these essentials should be chosen, other factors being equal. Another condition which should be observed is the popularity of the chosen breed among the neighboring farmers. as to them must one look for a market for his surplus stock. If there is no pronounced predilection it is more a question of the breed best adapted to the climatic and feed conditions. Whether it is a wool or mutton breed or one combining both depends on other conditions.

The breed determined, the foundation should be secured from a reputable, experienced breeder. An average animal from a flock produced by a real breeder, a shepherd who has established a fixed type in his flock, is more valuable than a superior individual that has just happened in some flock of unknown quantity. In the selections the judgment of the breeder may be relied upon to a great extent, especially in the matter of breed quality, a term difficult of accurate definition, but very essential, and a knowledge of which is only acquired by experience. The buyer, however, should have definite ideas as to what he wants in the ewes he gets and should insist upon having those possessing the desired characteristics as nearly as possible without sacrificing too much quality.

Some characteristic which his experience with his market flock has impressed him as being important in producing a better sheep should be sought, but with it should be remembered the necessity of maintaining a well-balanced individual. A ewe excelling in some one particular but lacking in others should not be preferred to an even, well-made one that shows good breeding. The flock when selected should have a uniform appearance. This is absolutely essential if best results are to be secured. An even, uniform lot, even though they may lack in some particular, is superior to a lot which has one or two extra good ones and the others of only mediocre quality. Uniformity should ever be sought, as it is the even lot in which all look alike that always appeals to the eye and to the pocketbook.

There are many points in a sheep which must be noted, more than in most classes of live stock, as both products, wool and mutton, demand consideration. First of all, however, constitution and bone are required. Neither wool nor mutton can be obtained from a weak, narrow-chested, spindle-legged animal. Lung power, denoted by a wide chest, flat shoulder, and large heart girt, accompanied by a broad back and round ribs, indicating digestive capacity, assure the owner of an animal capable of profitably transforming grass and grain into wool and mutton. Bone is likewise essential. In a sheep it is best indicated by the foreleg. Good bone does not mean length of leg; rather should it be straight and of circumference proportionate to length. Legginess should be avoided, as well as dumpiness. Neither is profitable, and both are obstacles to improvement.

The selection of the ram is more important than that of the ewes. He is half the flock. As a matter of fact, he is the whole flock. It has been the great sires that have made breeders famous. The buyer should have a fairly definite idea of the type of ram he needs, and when he finds what he thinks he wants he should not hesitate to pay the price.

In these selections one must not forget that a pedigree is valuable, not because it is a piece of paper bearing an association seal, but because it is a record of ancestors whose superior characteristics and individuality were considered of enough importance to warrant their breeders and owners in expending money and effort in maintaining that record. It is an insurance of pure breeding and an assurance of good breeding and prepotency.

The pedigree, however, must be accompanied by individual merit. Thrifty, well-grown animals demonstrate their own excellencies. True there are cases where the quality of the animal shows in spite of mistreatment, but it is better to buy those which show for themselves than to depend upon the statement of the breeder as to the matured form which may be developed. Show animals are not required; rather they should be avoided by the amateur; but good condition is essential to success in the lambing pens later.

Blood will tell, but it takes feed to make it. Many a well-bred animal has failed of full development because his owner depended too much upon the pedigree and not enough upon the grain trough. All the breeding in the world will not produce a good animal without ample and proper feeding, any more than all the feeding and shepherding possible cannot make a prize winner out of a scrub. We sometimes hear of pedigreed scrubs, but most of them have been made by the careless or parsimonious feeder who thought to make the paper develop the animal.

It behooves the shepherd to keep his flock in thriving condition at all times Constant, careful, sensible feeding ever insures a thrifty, profitable flock. Thus fed, they are enabled to make the most growth and the greatest possible development, and demonstrate their superiority over the average flock. The owner is never ashamed to show a flock so maintained, while his neighbors are naturally favorably impressed when they see his sheep always in marketable condition. Then they begin to realize wherein the pure-bred flock is better and pays more than the common grade flock.

The breeder must realize that his flock is being watched by his neighbors, and his success will be measured by the results he obtains. He must produce good animals, not necessarily ribbon winners in the show ring, but those which will produce more and better wool and mutton at the cost which average specimens would require. He must make progress in his work, and to do this he must have the encouragement of financial reward. To secure this requires the production of breeding animals possessing qualities which will improve the common market flocks and make their progeny more profitable to the farmer who raises them

To impress upon his neighbors the real value of his flock it may be necessary to demonstrate to them the greater market value of sheep of his breeding by fattening a portion of the lamb crop and selling on the open market. This plan is often good business. The poorer individuals can be profitably turned into money quickly; at the same time such culling of the flock increases the value of those left, while the market for breeders is naturally limited and requires few to supply it until the flock has acquired some local reputation. When he shows heavier lambs produced on similar feed and in less time, or a longer, heavier fleece which commands a price higher than the average, he will have gone far toward making evident the fact that he is maintaining his flock for profit and getting the money. Such demonstration will create a demand for his rams as breeders, and as the demand increases the price and value will advance.

Progress in breeding will be made according to the judgment displayed in securing rams which produce improvement along the desired lines. To do this intelligently every shepherd must have an ideal sheep in his mind, to approach as nearly as possible the production of which shall be his ambition. Perfection is not attained in this world, and it is best that it is not, for then would ambition cease. In the development of animal form it sometimes seems as if the goal were nearly reached, and then we change our ideal and continue striving for its attainment. No great constructive work is breeding sheep, nor any live stock, has been accomplished without the possession of an ideal by the man who produced it. In his mind is a picture of what he considers the perfect sheep, and in selecting and mating his breeders he attempts to choose those with the most pronounced characteristics essential to his ideal, and to secure their reproduction and intensification in the next generation.

This ideal may be rather indefinite at first, but as the shepherd learns more of his flock and sees the results of successive matings, his mind's picture attains clearer form, and with a better knowledge of what to demand and what to reject in the practical evolution of his plans. To be of greatest value this ideal must take full cognizance of practical possibilities and limitations and the proper proportions of the various factors involved in its production. With the flock one must not over-emphasize some characteristic which is of little practical value at the expense of those which are absolutely necessary. For example, an excess of face covering should not be gained at the expense of a strong back or straight rump or some other factor which is of market value. Factors which produce more or cheaper meat or wool demand first consideration: after that may be added any features which improve the appearance of the animal. Every man is certain to be a crank on some particular feature, but the real breeder is the one who can subordinate this personal prefer-

Profitable Dairying on the North Shore of N. B.

Last year an article appeared in this magazine about the good work being done by R. L. Hicks, of Dalhousie Junction, N. B., along the dairy line, but more especially in the breeding of high-class Holsteins; and such has been his progress in the last year that he deserves more than passing mention.

Mr. Hicks tested two heifers last year, and they both made very creditable records. One was sold; the other has again been tested in February, and turned out to be the best junior three-year-old ever produced in the Maritime Provinces or Quebec, and holding at that time sixth place in her class in Canada.

This famous heifer is Homestead Lass, an animal of enormous capacity, very gentle, and possessing a business look that gives one the idea when you first see her that she is not vigorously chewing her cud for nothing. She gave in the seven days 538.0 pounds of milk, containing 25.06 pounds of butter. So Lassie not only gave an enormous amount of butter, but also milked on an average of 76.8 pounds, more milk than the average herd through the country produces in the same time.

After the test was over and her milking periods lengthened and her feed cut down, a retest was ordered, and Mr. A. E. Dickie, of Central Onslow, was sent up to make a retest. Well, Lessie's owner got word six hours before Mr. Dickie was due to arrive. Lassie evidently heard the telegram, for she got right to work, and chewed hard, as much as to say: "I'll show you fellows a wrinkle or two," and by the time the retest was started Lassie was up to 81 lbs. per day.

No more need be said about Lassie, but it's just once in a long time that you come across one of her temperament, and she is going to be heard from again in the near future.

At the same time that Lassie was tested a junior two-year-old was tested after milking five months, and gave 11.97 pounds of butter. At the end of the sixth month in her lactation period she had given over 8,000 pounds of butter, and if she keeps on at her present rate she will easily go over 14.000 pounds—quite a nice record for Millie Pontiac Pledge. Mr. Hicks says he has as much faith in Millie as any cow in the barn, and that's saying something for her.

There is a common expression, "And the worst is yet to come," but in this case it is reversed, and "The best is yet to come." Two more cows were lately started in the seven-day test. One was a five-year-old, Lady Woodway, Clothilde De Kol 2nd, an exceptionally large cow and a grand feeder, and she made 21.05 pounds of butter in the seven days, which is no mean record for any cow, especially this one, for as a two-year-old she met with a very serious accident which nearly led her to the butcher.

Those who read the article in The Maritime Farmer last year will remember that mention was made of a two-year-old heifer that was started in the test but had her teat tramped on and she was dropped out. Well, every one knows that this would be a great hindrance to the proper development of this heifer, and would certainly not do as well in later years as she would have had that accident not happened. However, about a month after the accident her teat was fairly well healed up, and she milked along till within six weeks of freshening. She is an exceptionally large heifer, with good quality, and will make quite a show cow. Mr. Hicks entered her in the Chatham Exhibition, but she had milked every ounce of flesh off her and was so thin that she was left home. So you see any flesh she carried at the beginning of her section lactation period was put on in about six weeks.

On April 4th she was started in the seven-day test, and started off at a twenty-five-pound clip, but gradually rose till at the end of two weeks she stood fourth in her place in Canada, making 26.54 pounds of butter and 496.7 pounds of milk in the seven days, and 51.93 pounds of butter in fourteen days, and 9767 pounds of milk. So this makes Abbekirk Queen Countess the champion junior three-year-old dairy queen of eastern Canada. She is the result of Mr. Hicks' own breeding.

Starting in a few years ago, he purchased her grandmother. Her daughter was bred to his own bull, Maple Grove Mercena Mercedes, a bull who has never yet sired a poor daughter, and has the honor of being the first Canadian-bred bull to sire a daughter with a record equal, or greater, than Countess. These records, Mr. Hicks claims, made under his conditions, are equal to thirty-pound records made under ideal conditions in the herds of Canada's foremost breeders. More than that, there are men who have been breeding Holsteins for thirty years and in all that time have not reached such a high standard as has Mr. Hicks in his few years.

As a result of Mr. Hicks' advertising in The Maritime Farmer his bull was sold to Mr. F. L. Titus, of Bloomfield, Kings County, N. B., who was on the alert for something extra special in the Holstein line. But the bull proved rather too large for Mr. Titus' herd, and Mr. Hicks being very anxious to get his bull back when he realized his value, traded with Mr. Titus for a fine young bull bred by Mr. Hicks himself and owned for some time by his brother, of Bathurst.

Mr. Titus also bought two calves, one a daughter of Maple Grove Mercena Mercedes, out of Mr. Hicks' famous old producer and money maker, Maple Grove Belle; the other heifer is out of Homestead Lass. No better breeding can be obtained, and, judging by the condition and further development of Maple Grove Mercena Mercedes when he was returned to Mr. Hicks, Mr. Titus will certainly develop these two yearling heifers and it is hoped that he, too, will carry on testing; and we may rest assured that if he does records will be made which will be hard to equal.

Homestead Lassie's second calf, a bull, sired by Maple Grove Mercena Mercedes, has gone to the Brimner farm at Chatham, N. B., where he is developing into a fine animal, and he is upholding in appearance the reputation he has behind him for production, namely, that he is the only calf in Canada whose mother has a junior three-year-old record of 25.01 pounds, and his half sister with a junior three-year-old record of 26.54 pounds. The same farm has also purchased a granddaughter of Maple Grove Patti, with a record of 32.59 pounds of butter, and a granddaughter on her father's side of Maple Grove Belle. So this farm also has great foundation stock, and plans are being made to purchase one or more Holstein heifers, and testing will be carried on.

Again turning to the Hicks herd, it is interesting to mention the high average test of the milk produced on this farm. How often have we heard people remark: "Oh, yes, but Holstein milk is a pretty poor looking article!" But wait a minute! When the tests were being conducted the supervisor, out of curiosity, took a sample of the milk when it was loaded on the sled, ready for market, and it tested four per cent. Poor milk is an unknown article on the Hicks farm.

Again we hope that the proprietor of Maple Grove Stock Farm will continue his grand work in putting before the people of the Maritime Provinces an example of what a man can do when he works honestly and diligently, not only in his own interests, but in the interests of others, and what can be done in the line of profitable dairying on the North Shore of New Brunswick.

The Milk Situation in Saint John

The intimation by the Kings County Milk Producers' Association that after September 1st they would increase the price of milk to the St. John dealers from 30c and 35c per 8-quart can—the summer and winter prices respectively—to a flat rate of 40 cents per can brought a hue and cry from the St. John milk dealers.

All of a sudden the dealers' heartstrings relaxed. They could not possibly think of raising the price of milk to the consumer, who is now paying 8 cents. They claimed that to raise the retail price to 9 cents per quart would be ruinous to the consumer and that many of the poorer classes would have to dispense milk from their diet.

In the tenderness of their hearts they could not, therefore, think of raising the price per quart to nine cents, and therefore it would be impossible for them to meet the demands of the milk producers.

On the other hand, the producers contend that at the present high cost of feed, labor, etc., it is impossible for them to make milk profitable at the present prices.

Meetings were held in Sussex, Norton, and St. John, but no definite settlement was concluded. Some of the dealers have, however, contracted with some farmers for 40 cents per can.

The demands of the Kings County milk producers are quite reasonable and in keeping with the prices asked and received by milk producers in other large centres. They resent the attitude of the dealers in dictating what price the producer should ask for his milk. The time is here, and it has not come any too soon, when the farmer must arise and dictate to the dealer what price he asks and must receive for the various farm commodities he has for sale. All other classes of manufacturers set a price on their goods, and the buying public must pay accordingly.

It will be interesting to our dairymen to read the prices that are being asked for milk in other places.

The Milk Committee of the West Sussex, England, Farmers' Union met recently to consider the price of milk for the ensuing year. The question was, said a member: what was a fair price to allow dairymen for retailing. The dairymen had their labor troubles as well as the farmers, and the point was whether they could do the retailing at 8d. or 9d. a gallon. It would be fatal to milk producers if, however, the retail price was pushed to more than 6d. a quart. At 8d. the dairyman was allowed 33 1-3 per cent. It was decided to recommend the delegates to the conference at Brighton convened for dealing with the matter to advocate 1s. 4d. a gallon for the seven winter months, and 1s. 2d. for the five summer months.

At a meeting of delegates from the Dairy Farmers' Associations in the area south of the Thames, England, held at Brighton recently, it was recommended that the price of milk for the ensuing winter months be 1s. 6d. per imperial gallon, the feeling prevalent being that only by offering a sufficient inducement to the farmer to meet the enhanced expenses of production was there any possibility of maintaining the supply in any way equal to the requirement of the nation.

Ottawa district milk producers are asking an advance to twenty-two cents per gallon for their product, to take effect from September 1, which would mean an advance to the consumer from eight to nine cents per quart. The reason given is the increased cost of producing milk, due to the scarcity and price of labor and the cost of dairy cattle feeds. Though the hay crop was large, many find it more profitable to sell than to feed it. The local grain crop was very far below a fair average, and the corn crop was very late and at best uncertain. Bran, gluten, oil cake, and other necessary feeds had gone up about twenty per cent., and cows another twenty per cent. In all this increased cost of production would average about twenty-five per cent. Furthermore, the milk supply had fallen, and the price was in a large measure governed by the prices of butter and cheese, which were soaring because of the foreign demand. The officer of the forage department at the Central Experimental Farm stated at the producers' meeting that milk at current prices was being produced at a loss.

The retail prices of milk in some of the important centres in Canada in July, 1916, were as follows:

	Quart
Sydney	10c
Halifax	9c
Charlottetown	7c
Moncton	8 to 9c

THE LABOR PROBLEM IN FRANCE

Prof. M. Cumming sent us the following interesting excerpt from a letter from one of the students of the N. S. A. C. who is now "somewhere in France":

"The labor problem which is confronting the farmers of Canada today is, I will admit serious; but I think that it would be small in comparison with that of France if it were not for the women. I have watched an old woman who I would judge to be near sixty years old drag a wooden spike-tooth harrow across and back an acre field until she had the ground as mellow as one would wish; then sow her grain by hand from her apron; then go over the field again with the harrow. On the larger farms, of course, they have horses, but I have never seen a seeder and only one mowing machine and two binders since coming to this country. The harvesting is done almost entirely by hand, and the crops are surprisingly heavy considering the crude way the ground is worked."

USE OF LIME IMPROVES PHYSICAL CONDITION OF SOILS

During recent years the practice of using lime upon our fields as a factor in the production of large crops has come to the front. Many farmers who have been growing large yields of certain kinds of farm produce found that the quantities were for some reason growing less and less. They were at a loss to account for this. The seed germinated freely, but did not produce the same vigorous growth of former years. In many parts of the country where this condition existed the land was said to be clover sick, and as this and the legumes were the most affected it was advised that this crop should be dropped from the rotation for a while until conditions became more favorable again; but while this practice seemed to be somewhat beneficial it did not overcome the difficulty. A thorough investigation of the causes by scientists at the experimental stations and other places revealed the fact that in most cases where this condition prevailed the soil had become sour and needed some alkaline substance to neutralize the acid and turn it into a neutral salt For this purpose a great amount of interest has been developed in placing upon the market in convenient form some one or more of the lime products to accomplish this result. Especially has this matter been brought more prominently before the public during the last two or three years, as plants for this purpose have been set up here and there throughout the country.

Soils become acid by the fermentation and decay of barnyard manure and the various vegetable matters added to it from time to time. If there is sufficient lime present in the soil when the decomposition and fermentation takes place the acid will be neutralized by it and no application will be necessary. In the early days of agriculture much of the land had plenty of lime for the best results, but as the years have advanced the gradual removal of this for overcoming the soil acidity has caused much of the land to be deficient, particularly where large crops have been grown and much manure used, causing greater fermentation and production of acid. Many soils also are deficient in the beginning, and hence have need of a supply of lime when first brought under the plow for crop production.

In addition to the benefit to be derived from lime as a neutralizer of acid conditions, it has a direct effect upon the physical properties of a soil, rendering it more friable and easily cultivated. Heavy, sticky clay lands are so loosened up that crop production is successful where it was previously of little service. Sandy land is also improved by rendering the particles more adhesive and firm and thus being less open does not dry out as readily.

Another beneficial effect of lime is its liberation of mineral plant food. Phosphoric acid is largely held in the soil in combination, and not readily available by plants. The action of lime improves this condition. Most of our soils contain large quantities of potash also in insoluble form, but by the action of lime it is rendered available for plant food. This is a very important fact at the present time on account of the scarcity of this article and the high price it commands. Another great benefit to soils from the presence of lime is the bacterial benefit. There are many forms of bacterial agencies in soil that are necessary to the successful growth and development of crops. Of these the most important from an agricultural point of view is the nitrogen gathering bacteria associated with the legumes.

The method usually employed for determining if a soil is in an acid condition is the blue litmus paper test. hTis article may be obtained from any drug store, and if it comes in contact with acid for a short time it will turn red. To test a soil for acidity, procure several small portions of earth from different parts of the area to be tested, a few inches below the surface, and mix them together. Then dampen them sufficiently to pack a portion into a ball-like form, break open, and lay the paper between the parts, and press together again. Let it remain there for 10 or 15 minutes, when, if there is any acid present, it will have turned red. Care must be taken that hands are clean and that no acid has been present in any form from other sources than the soil under test.

There are several forms of lime that may be used for agricultural purposes.

Quicklime is obtained from burning limestone or corbonate of lime when it is decomposed, and carbonic acid is given out in the shape of gas, while quicklime remains behind. This form of lime must be slacked before it can be evenly distributed over a field. Fifty pounds to four square rods will give an application of one ton per acre. If water amounting to one-third of the weight be added and the heap covered with an inch of soil the lime will soon slake, when it may be spread with a shovel. Hydrated lime is simply the quicklime slaked with water and while in convenient form it will be too expensive for agriculcural purposes.

Air-slaked lime is quicklime that has been exposed to the air for a sufficient length of time to become slaked without the addition of water other than what it absorbs from the atmosphere. It differs from the freshly slaked lime in that it has taken up some carbon dioxide from the air and part of the lime has passed back into the carbonate condition. Ground limestone is simply the limestone rock similar to that which is burned in the preparation of quicklime, finely pulverized. The finer it is ground the quicker its action will be felt in the soil. It need not be ground very fine as the coarser parts will become gradually worked down and thus an evener distribution made over the succeeding years without waste than if all the particles were very finely ground. If the coarser parts correspond to wheat grains and the balance down to very fine particles it will be a good form. Land thus treated will need an application only every four or five years.

In the application of lime, equivalent weights is an essential that needs careful consideration. Fifty-six pounds of quicklime will have the same action in correcting acidity as 74 pounds of slaked lime and 100 pounds of carbonate of lime or ground limestone. In general practice two tons of ground limestone is considered as equal to one ton of quicklime. Which form of the lime is best to apply will depend upon the soil for which it is intended. If the soil be a stiff clay in need of improving physically the quicklime will be best on account of its quicker action and the little chance of too rapid decay of organic matter. Where rapid action is not an important part, as in case of sandy soils, the ground limestone will be best. In muck and peaty soils that are very acid the quicklime will be best.

The amount of lime to be applied will vary with the quality of the soil and the amount of acid present. Usually one ton of fresh quicklime or two tons of ground limestone will be sufficient per acre. Agricultural lime is best applied on the surface and worked into the upper soil by cultivation.

The application of lime is somewhat difficult unless a machine is used, as spreading with a shovel from a wagon box cannot be regulater to any degree of exactness, nor be put on very evenly. There are, however, low-priced lime sowers on the market which are satisfactory; even a manure spreader can be used to advantage. Fertilizer drills may also be used, but going twice over the ground will be necessary, as enough cannot be got on in one operation.

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

SUPPORT THE EGG CIRCLES

Every one familiar with agricultural conditions knows of the mighty work which has been, and will continue to be, accomplished for Prince Edward Island by the Egg Circle movement. For three years past this has been dealt with as a co-operative work, and 1916 will see rather over $350,000 paid out to the farmers' wives and children of that small province through the circle, while at the same time "Island eggs" have taken their rightful place as a standard commodity, not a football amongst the Montreal speculators, to be bought only at half price and sneered at because of small size and poor quality. Great credit is due the men who started and pushed this work to its present point. No one doubts the future. The result to date guarantees that.

The strange thing is that New Brunswick and Nova Scotia have not taken this up more quickly and without urging. Nothing gets quicker returns than poultry. Nothing pays anywhere near as well on the first investment. These provinces by reason of their uniformly cool summers can produce eggs over a longer period than any other part of Canada. And in addition to the home and western Canadian demand we have the American market and the export. There need be no talk of over-production. When other sections over-produce we will still be nearest to the large outlets, and that day is, in any case, too far off to be considered at this stage.

We have said that great credit is due the agents of this movement on the Island. Not the least of this belongs to the clergy of all denominations. We hold no brief for or against the country merchant. But if that party in any district does not get into the egg business in the right way the egg business does not, and should not, belong properly to him. The producer is the man entitled to the return for producing a good article, and same should not, and in the egg trade must not, be taken away by improper methods.

It is highly gratifying to know, having got the Island organization along to a much more than self-sustaining point, the federal department is now preparing, with the active co-operation of the Provincial Department, to develop the circle movement in New Brunswick. We trust that all interested will join with them and with **The Maritime Farmer** in speeding it up. Nothing can be simpler. The farmers of a given district get more hens and deliver their eggs once at least each week, receiving then the cash for the delivery of the previous week, by standard, according to quality, which means freshness, strength, and size. Each egg has been examined by trained hands, who neither know nor care who delivered it, and all are candled and put into cases as they ought to grade. The buyer knows what he is getting. He can pay more for it. The farmer knows within one week if his methods are right. The occasional meetings to discuss details will give opportunity for further exchange of ideas as to feeding methods, breeding in better laying stock, and a hundred other things, the net result of all which is to make the undertaking pay better each season. New Brunswick ought in the same time as the Island has done to be producing more eggs than the Island does. Consider for one moment what $350,000 more revenue per year will mean to the farmers of this province. Why, we laugh at war taxes!

And this is not day-dreaming. **It has been done.** That is the answer. And, more even than that, it has been done by a people with less than a third of our population, with uncertain winter shipping service, and with a reputation in the production of inferior eggs to live down, which in itself would have discouraged any except enthusiasts led by men who realized the natural advantages they had to offset it with.

Our surplus can at all times be stored at St. John under exactly same conditions as are elsewhere available and at the same rates. It is, in fact, intended that the candling station for New Brunswick, which, by the way, will also serve the western end of Nova Scotia, will be established at the St. John storage, and our further understanding is that the storage people are undertaking to store only candled eggs and provide free space for the station for three years.

This will put it right up to the producers. The buyers are ready. The idea, as we have said, is not new. But, let us repeat, it is highly adaptable. And—IT PAYS. We bespeak for the movement a keen interest and a prompt and favorable reception.

NEXT YEAR'S SEED GRAIN SUPPLY

We trust a great many of our farmers have taken the precaution to go through their grain fields before they were harvested and picked off a sufficient quantity of the heads from the most productive plans to start a seed plot next year. We know no other work that brings in such a handsome remuneration as does the work of seed selection.

The soil may be well cultivated, well drained, and well fertilized, all of which processes mean expense in time and money; and the season may be favorable for good growth; but if the seed used is not of the best quality the maximum returns for time, labor, and investment will not be realized.

The best time to select next year's seed supply is when the grain is ripe and uncut in the field. If this has been neglected, do not neglect to do the selectiing at threshing time. Use your fanning mill to the best advantage and separate as many of the plump, heavy grains as you can for next year's seed. The lighter portions are not good seed and will do first rate for feeding. To put off the selection of seed until the major portion of your grain has been fed to the stock or sold is a ruinous policy for the grain grower.

If you were working for some firm for $2.50 per day and you saw an opportunity to get $3.00 per day for your services from the same firm, you would not hesitate to equip yourself and work for the increase. The method you follow with your seed, be it careful or be it negligent, will determine to a large extent the wage you earn and the profit you make in the pursuit of your farming operations.

EXHIBITIONS

The season of the Fall Fair is now with us. It is a time of great interest to all, and particularly to our live-stock readers. Much of the best stock of each district is collected for competition and the placing of the awards to many is the greatest event of the year.

Look at the machinery exhibit and see what improvements are there! In this way you are gaining first-hand valuable information, combined with a pleasant outing. That is what the fair is for. It is a time of meeting friends, of seeing sights, and of being educated, and it is our desire that each of our readers will get the best possible from this annual outing. Go with the intention of having a good time, because recretation is essentially needful, and particularly to those who are somewhat isolated from their neighbors.

Get all the new ideas you can that are likely to be of benefit to you. Be on the outlook for them and don't be backward in asking questions from the fair board management or others who are likely to be able to give you the information you want.

The ladies will naturally spend much of their time in the hall, seeing the various kinds of fancy work, preserving, cooking, etc. It is all important, and do not overlook the clean attractions, as that feature of it helps to make the outing enjoyable.

Our advice is to go to your local fair, help boost it and get all the good you can.

ADVERTISE IN MARITIME FARMER

The Maritime Farmer, the only recognized exclusive farm paper published in the Maritime Provinces, goes regularly twice a month to the homes of the most progressive farmers in Nova Scotia, Prince Edward Island, New Brunswick, and Newfoundland The various members of these homes are deeply interested in one or more of the farm industries discussed in its columns every issue.

Has it ever occurred to you that when you wish to purchase some line of seed or live stock that just what you want to buy could be furnished very readily by one of the readers of **The Maritime Farmer?** Why, then, not insert a small ad in our columns, stating what you wish to buy? Replies will come thick and fast, and you will have no difficulty in securing knowledge of where the commodities you require can be procured.

If, on the other hand, you have stock or seed for sale, there is no quicker way whereby you can get purchasers than by letting the readers of **The Maritime Farmer** know what you have for sale. Many of them are just waiting to find out where such commodities may be procured. Try an ad in the columns of **The Maritime Farmer.** The cost is nominal, and the results will amaze you.

WAR LOAN

DOMINION OF CANADA

Issue of $100,000,000 5% Bonds Maturing 1st October, 1931.

PAYABLE AT PAR AT

OTTAWA, HALIFAX, ST. JOHN, CHARLOTTETOWN, MONTREAL, TORONTO, WINNIPEG, REGINA, CALGARY, VICTORIA.

INTEREST PAYABLE HALF-YEARLY, 1st APRIL, 1st OCTOBER.

PRINCIPAL AND INTEREST PAYABLE IN GOLD.

ISSUE PRICE 97½

A FULL HALF-YEAR'S INTEREST WILL BE PAID ON 1st APRIL, 1917.

THE PROCEEDS OF THE LOAN WILL BE USED FOR WAR PURPOSES ONLY.

THE MINISTER OF FINANCE offers herewith, on behalf of the Government, the above named Bonds for subscription at 97½, payable as follows:—

10 per cent on application;
30 " " 16th October, 1916;
30 " " 15th November, 1916;
27½ " " 15th December, 1916.

The total allotment of bonds of this issue will be limited to one hundred million dollars exclusive of the amount (if any) paid for by the surrender of bonds as the equivalent of cash under the terms of the War Loan prospectus of 22nd November, 1915.

The instalments may be paid in full on the 16th day of October, 1916, or on any instalment due date thereafter, under discount at the rate of four per cent per annum. All payments are to be made to a chartered bank for the credit of the Minister of Finance. Failure to pay any instalment when due will render previous payments liable to forfeiture and the allotment to cancellation.

Subscriptions, accompanied by a deposit of ten per cent of the amount subscribed, must be forwarded through the medium of a chartered bank. Any branch in Canada of any chartered bank will receive subscriptions and issue provisional receipts.

This loan is authorized under Act of the Parliament of Canada, and both principal and interest will be a charge upon the Consolidated Revenue Fund.

Forms of application may be obtained from any branch in Canada of any chartered bank and at the office of any Assistant Receiver General in Canada.

Subscriptions must be for even hundreds of dollars.

In case of partial allotments the surplus deposit will be applied towards payment of the amount due on the October instalment.

Scrip certificates, non-negotiable or payable to bearer in accordance with the choice of the applicant for registered or bearer bonds, will be issued, after allotment, in exchange for the provisional receipts.

When the scrip certificates have been paid in full and payment endorsed thereon by the bank receiving the money, they may be exchanged for bonds, when prepared, with coupons attached, payable to bearer or registered as to principal, or for fully registered bonds, when prepared without coupons, in accordance with the application.

Delivery of scrip certificates and of bonds will be made through the chartered banks.

The issue will be exempt from taxes—including any income tax—imposed in pursuance of legislation enacted by the Parliament of Canada.

The bonds with coupons will be issued in denominations of $100, $500, $1,000. Fully registered bonds without coupons will be issued in denominations of $1,000, $5,000 or any authorized multiple of $5,000.

The bonds will be paid at maturity at par at the office of the Minister of Finance and Receiver General at Ottawa, or at the office of the Assistant Receiver General at Halifax, St. John, Charlottetown, Montreal, Toronto, Winnipeg, Regina, Calgary, or Victoria.

The interest on the fully registered bonds will be paid by cheque, which will be remitted by post. Interest on bonds with coupons will be paid on surrender of coupons. Both cheques and coupons will be payable free of exchange at any branch in Canada of any chartered bank.

Subject to the payment of twenty-five cents for each new bond issued, holders of fully registered bonds without coupons will have the right to convert into bonds of the denomination of $1,000 with coupons, and holders of bonds with coupons will have the right to convert into fully registered bonds of authorized denominations without coupons at any time on application to the Minister of Finance.

The books of the loan will be kept at the Department of Finance, Ottawa.

Application will be made in due course for the listing of the issue on the Montreal and Toronto Stock Exchanges.

Recognized bond and stock brokers will be allowed a commission of one-quarter of one per cent on allotments made in respect of applications bearing their stamp, provided, however, that no commission will be allowed in respect of the amount of any allotment paid for by the surrender of bonds issued under the War Loan prospectus of 22nd November, 1915. No commission will be allowed in respect of applications on forms which have not been printed by the King's Printer.

Subscription Lists will close on or before 23rd September, 1916.

DEPARTMENT OF FINANCE, OTTAWA, September 12th, 1916.

HORTICULTURE.

A CAVE FOR VEGETABLES

A reader writes to ask if there are any points in favor of a cave for the storage of potatoes, and inquires as to how he shall proceed in making one that will be satisfactory.

Personally I prefer outdoor pits for storing fruit and vegetables, as I have little trouble in keeping them till the following spring, and it is certain that no other method yet discovered will so assist in retaining the natural flavor of whatever product is being stored. However, there is considerable risk attached to pit storage, since a late fall rain may catch one with the pit not entirely waterproof, in which case the moisture reaching the stored products will cause mischief later on. Also, in case a warm spell of weather comes on unusually late, it may get the products too warm in the pit, causing deterioration.

With cave or cellar storage the products will keep well. They will be handy for family use or for taking out to market. The labor attached to storing will be less than with outdoor storage in pits. And if deterioration of any kind should set in among the stored products those in cave or cellar will be where the damage will be noticed and remedied, while those in pits might ruin before one happened to open the pits and ascertain the trouble.

The cave must be built along correct lines if it is to accomplish the object of storage—that of keeping the stored products dry and cool.

Not only must the floor be dry, but the walls should be absolutely moisture proof. An efficient drain should lead away from the floor of the cave to guard against the possibility of dampness creeping in somewhere. A ventilating shaft should occupy the center of the cave. This allows the escape of odors arising from the stored products and is an important factor in guarding against deterioration that might set in if these odors were confined in the cave with the products.

Keep the fruit and vegetable cave clean, dry and cool till time to put the products in storage and put them away on a day that is as cold as possible without freezing them. Arrange barrels, bins, and boxes with a little fine dirt in the bottom, covering and lining the sides with straw or hay or leaves. These help in confining the natural flavor of the products. Keep the temperature low and as uniform as possible, avoid the withering effect of alternate warm and cold air on the stored products.

In this section there are four popular kinds of material used in cave construction. Lumber, either one or two-inch material, is nailed to posts set in the ground, the lumber being on the outside of the posts, so it will not crush inward. Ordinary building brick also is employed by some, but a brick cave is a little more apt to draw moisture than one built of any other material here mentioned.

Cement caves are becoming popular, because of the fact that one can build forms and run the cement in not only the walls, but the roof as well. About a fourinch thickness of cement is all that is required for walls and roof.

Another even more popular material for caves is clay tile, as it contains a dead-air space, hence is warmer and drier than the other materials. It also is light, easily built in, and practically indestructible after once in the walls.

It should be understood that all caves should have a foot or two of dirt covering after being built, to shut out cold and moisture. Also, there should be a door leading into the cave proper, and another rain-proof one at the head of the steps leading into the cave.—M. .C

HOW TO BLANCH CELERY

Celery must be thoroughly blanched before using. It then becomes crisp and tender. The blanching may be done in the garden or in storage. The summer and fall crop must be banched in the garden, while the winter supply may be cared for in storage. To secure the desired result in the open, stand boards along each side of the rows and secure them with stakes. The plants need to be hilled up a little. A better metho'l of blanching, so far as quality of crop is concerned, is to invert a drain tile over each plant when about twelve inches in height, filling the tile up with sand until only the tips of the leaves project. It is advisable to remove broken or injured leaves, especially those that show any tendency to decay, for they will affect others as the decomposition goes on.

Winter celery need not be blanched much before storing it. It may be left in the garden until the latter part of October, for a light frost will not hurt it; severe freezing will, however. Any cellar that is good for keeping root crops is all right for storing celery. Put some moist soil or sand on the floor in a dark corner of the cellar. The celery should be perfectly dry when taken up, for if stored while wet with rain or dew it is sure to rot. Take up the plants with some soil adhering to the roots. Trim off some of the older outer leaves and pack the roots rather closely together upon the bed of soil, and then pack some more moist soil over the roots, covering them well. They will make new white growth in a short time.

Celery that has been well blanched in the garden may be taken up and stored in the cellar for a few weeks by proceeding as follows: Trim the plants about the same as when they are prepared for table use, pack rather closely together in damp moss, and stand upright in a box. The top of the box must be left open for ventilation. In this way the celery may be kept in good condition for several weeks.—W. F. P.

Farm Between Two Cities

Equipped Only $2100

Only 2½ miles to one city; 42 acres, 100 choice apple trees, a lot of pears and peaches, some wood. Good 2-story 9-room house; clapboarded barn with cellar; 200 hen poultry house. Owner has other business and makes low price $2100, part down. If taken now, horse, cows, hens, buggy, wagon, cart, tools, machinery, crops and a lot of stove wood included. Great chance to work in city and live on farm. For travelling instructions see page 7, "Strout's Big Bunch of Bargains," copy free. E. A. Paint that House this Fall

Protect it from the destructive effect of a winter's snow and ice—save valuable time next spring for other work. Fall painting pays.

But be sure you choose the right paint—one that will *give* your buildings the years of protection that you've paid for.

B-H "ENGLISH" PAINT

is made according to the formula which scientific tests and many years of experience by practical painters prove to be best to meet Canadian weather conditions.

Formula: 70% Pure White Lead
30% White Zinc
100% Pure Paint

It contains 70% of Brandram's B.B. Genuine White Lead—of standard purity for over 100 years—and 30% of pure white zinc—thus combining, in the proper proportions, pure lead and pure zinc, and making a perfect paint. You take no chances with B-H "English" Paint. *Be sure you get it!* There are cheaper paints, but none more economical when covering capacity and length of wear are considered.

Sold by all leading hardware dealers. For Color Cards, Booklets, prices and the name of the nearest agent in your locality, please communicate with

BEES NOT INJURIOUS TO FRUIT

A committee appointed in Italy to study if bees are injurious to fruit has reported. The report states that bees, from their instincts, the conformation, function, and movements of their mandibles, as well as from the shape and consistency of the other mouth parts, cannot perforate the skin of fruit, and it is only incidentally that they lick and suck the juice exuding from fruits which have been injured by other natural causes.

The injuries to orchards and vineyards sometimes attributed to bees are due to poultry, wild birds, wind, and hail, and most frequently to hornets, wasps, vine moths, and other insects. The destruction of hornets and wasps is recommended; it is easily effected, because their nests can be found without difficulty.

Bees do not injure grapes or other fruit even indirectly; on the contrary, they are beneficial to them, either by bringing about the cross-pollination of the flowers, and hence the setting of the fruit, or by promoting the dessication of damaged fruits from which they absorb the juice and pulp thus preventing fermentation and rot extending to sound individuals (this is especially the case with grapes).

The orchards and vineyards frequented by bees give the most constant crops; the hive is a very useful and sometimes a necessary addition to the orchard.

In the interests of public economy, agriculturists are strongly advised no longer to entertain any suspicion as to the harmfulness of bees, and wherever possible to associate apiculture and agricultural enterprise.

It is hoped that in the event of any changes being made in existing agricultural legislation, the statement—already implicitly made—of the inoffensiveness of bees will be set forth in formal terms, and that the province will encourage the development of apiculture.

WHAT CO-OPERATION WILL DO

Co-operative marketing is the only method whereby the shipment of the produce of the farm can be so regulated as to not overcrowd certain markets and leave other markets bare.

It is the only method whereby our apples can be placed in right quantities on the markets to realize the highest prices.

It is the only method whereby new markets can be developed to the profit of the grower instead of the operator or speculator.

It is the only method whereby the grower can have his apples marketed at a fair cost.

It is the only method whereby the grower can get right to the actual wholesale dealer in Europe.

It is the only method whereby the grower can get into direct touch with the really big buyers, the buyers who will take whole cargoes.

It is the only method whereby large combines and organizations can be effectually dealt with.—A. E. Adams.

However advantageous the use of commercial fertilizers may be, farmers should still regard farmyard manure as the basis for maintaining the physical condition and fertility of the soils, and should endeavor by careful management to make on the farm and protect from waste a good supply of this most valuable substance.

The beneficial action of basic slag on heavy clay soil is well known, and the reason for this benefit is to be found in the effect which slag produces on white clover. In the absence of clover slag is of no value to pastures on heavy land.

MAKING CHEESE FOR THE HOME

An easy method of making small cheese for home use is thus described by an Australian lady:

"Some years ago I learned to make cheese while visiting at the home of a friend, and it has proved a very useful part of my education by supplying our table with a good and wholesome article. Besides, when our friends and neighbors tasted it I became famous for the production of fine home-made cheese, and had demand for more than I could make. The hints herewith may be useful.

"For home cheese making on a small scale one usually has all the required implements at hand. First, a well cleaned wash boiler will answer for a vat. Take five quarts of milg for easc vat. Take five quarts of milk for each pound of cheese to be made—a 4 or 5 pound cheese is about right for family use. Use all morning's milk if possible; if some evening's milk is used be sure that it is sweet and skim, as a beginner is apt to lose that cream.

"Put into the boiler and heat to eighty-five degrees; remove from the stove and add the rennet. I use cheese rennet tablets, also cheese color tablets, which I buy at the dairy supply stores. The proper directions come with them, and if followed one cannot make a mistake about the amount of rennet to be used. But with the color tablets one must use judgment, as some milk has more natural color owing to different conditions, such as feed, seasons, and so forth, and some people like highly colored cheese while others prefer it very pale.

"Add the rennet and color tablets previously dissolved in a little warm water, to the warmed milk; be sure to use a dairy thermometer, for there must be no guesswork about cheese making. Stir thoroughly and cover with a cloth; let stand for forty to sixty minutes, or until it becomes of a good thickness, and if the curd is broken the whey will at once ooze out. If on testing it has not reached this stage let it stand a while longer. Now cut both ways with a long knife, clean to the bottom of the boiler, about an inch apart each way. Cover again and let remain for a short time. Soon the whey will rise, which may be dipped off with a bowl, having first spread a cheese cloth over the curd. Dip off all the whey possible. Then tape a sharp skimmer without a handle and stir and chop and turn the curd until it is quite fine. Do this as gently as possible, for the more gently it is handled all through the less cream will be liberated, and consequently the better will be the cheese. The whey should have a greenish cast and be nearly transparent. If it looks milky there has not been enough rennet or not enough heat; this cannot be remedied this time. One learns by experience about such things.

"Next place a clean, wet cheese cloth in a clothes basket; place the basket slanting in a tub, dip the curd on the cloth, and let the whey drain off. Meanwhile, heat several quarts of whey to ninety degrees and pour over the curd. This will harden the curd and make it squeaky; work gently with the hand until the whey it off. Now it is ready for the salt. Cheese requires less salt in proportion than butter. Work the salt through and taste to see if it is salty enough. Now place the cheese hoop, which may be a wooden bucket or pack measure with the bottom out, on a clean board. Spread a wet cheese cloth in the hoop, then dip in the curd; arrange the cloth over the top, then put on the cover, which should be a round board to fit in the hoop. A good home-made press is made by hanging a scantling to the wall in some convenient place two or three feet from the floor. The hoop is placed under this, with an upright block of wood on the round broad.

"The amount of pressure is regulated by hanging a bucket containing stones or other heavy substances on the end of a lever. The pressure should be increased gradually. The cheese should remain in the press until evening; then take out and turn on a clean wet cheese cloth, trim off all uneven edges, and put back into the press and leave until morning. Take out fo press, bandage it with cheese cloth, after which rub it thoroughly with melted butter, and cure it in a warm, airy room. Turn and rub with a very little fresh butter every day for a week; after that turn every second day and rub well without using any butter. It can be cut when four weeks old, but is better six or eight weeks. This differs according to taste, as some people prefer it more green than others."

A GOOD UDDER HIGHLY IMPORTANT

A good uddder is one of the most important items to consider in the selection of a profitable dairy cow. The size and shape of the udder will determine largely the quality of the cow, and whether or not she is capacitated to produce a large amount of milk. It should be rather square in shape, with plenty of depth, width, and length. The lower portion of the udder should be level and broad. It should reach far upward on the under side of the cow and should extend well up between the legs.

Size is by no means the most important feature in considering a good udder. Good quality is far more essential. A good quality udder can be judged by the skin being of fine texture, and very soft and pliable. The thick, coarse skin that feels hard to the touch should be avoided. Fleshiness and coarseness of the udder is an indication of inferior quality.

The good quality udder that possesses a fine, pliable skin will shrink considerably after the milk has been drawn. The skin will lie in soft folds that will fill out before the next milking time. With the fleshy udder there is not a great deal of difference befoer and after milking, but it seems to be full of milk all the time.

The good quality udder can best be deteced after milking. If one was only looking for size in udder he surely wouldn't pick on the one with the soft, pliable skin. But the man who is onto his job will avoid the fleshy udder and will understand why size is not all we

HAD KIDNEY TROUBLE For SEVERAL MONTHS

DOAN'S KIDNEY PILLS CURED HIM.

Mr. Fred. Stevens, Raymond, Alta., writes: "I am writing to bear my testimony of your wonderful medicine. I had suffered for several months with kidney trouble. I had been under the doctor's care for two months, when I read your advertisement. I at once purchased four boxes of Doan's Kidney Pills, and when I had used two boxes of them I was cured. I have recommended this treatment to several of my friends."

When you ask for Doan's Kidney Pills see that you get "Doan's." The wrapper is grey and our trade mark "The Maple Leaf" appears on every box.

Doan's Kidney Pills are 50 cents per box, or 3 boxes for $1.25; at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering direct specify "Doan's."

THE CARE OF MILKING MACHINES

One of the facts brought out at the recent National Milk Show at San Francisco, where milk was judged after it had been produced seven or eight days and shipped from all parts of the country, was that it is a credit to the milking machines, as several of them produced milk that exhibited as low as a few hundred in bacterial count.

One of the most important needs of users of milking machines is that of quick cleaning. This can be done by running cold water through the machines immediately after they have milked the last cow, until such water looks clear, showing that the milk has been taken out of the tubes and cups of the machine. Then at least once a day it should be thoroughly washed with a washing powder that conains no animal fat, as animal fat is detrimental to rubber parts and tubes, such as all machines are now using.

The washing of a milking machine is similar to washing a cream separator. It should be done properly at the proper time. The same rule applies to all milking utensils. They should not be allowed to stand until the casein hardens.

The writer has seen a number of cases where through lack of washing the machines failed to produce proper results, either in speed or thorough-milking. The man who is in the dairy business must expect to dash his dairy utensils the same as he would feed his hogs if he were in the hog business. Not only is this essential for the successful operation of the machine, but leaving the milk stand on the rubber parts any length of time is very detrimental to the rubber, as the animal fat acts upon it in a way that is damaging to the rubber. I think that makers of cow milkers will testify that their greatest trouble comes from the lack of thorough cleansing of the tubes and cups. A vast amount of education on dairy sanitation has been given farmers in the past few years, and it is necessary that they take the lessons well to heart if they invest in milking machines.

When buying a heifer the first point to consider is that the animal is strong with a deep flank, indicating constitutional vigor, and the next is to see that her udder is right in form, and that her teats are large and set wide apart. If a cow is to be a good milker she must have somewhere to keep it, which does not, however, mean a thick, fleshy udder. As secondary and fancy points, a slim neck and long head with fine horns are good features. Above all things, avoid those heifers that show very small rudimentary teats, or those with large ones set close together. Such a heifer will never make a first-class cow. There are always risks to be run before securing a good cow without starting with those that can never improve. Even the best of pedigrees cannot make a good cow out of a heifer with a deformed udder.

expect in a well-developed udder.

The udder should develop uniformly. Each quarter of both portions should be the same size, and the fore and hind part should hang on the same level. It means poor milking qualities to see one quarter of the udder smaller than the rest. The development of the udder depends a great deal on how the heifer is milked. Care should be taken when milking the heifer so that all parts will receive the same attention.

The teats should be wide apart on the udder. Improper milking will often cause the front teats to be wider apart than the back ones. Short teats are very difficult to milk. However, we frequently find heifers with short teats that attain quite a growth as they get older. Teats should be rather pointed at the end instead of flat.—M. A. H., Glengarry Co.

DE LAVAL SEPARATORS

Make Fall and Winter Dairying More Profitable

THERE are special advantages in using a good cream separator during the fall and winter months. The milk from cows long in lactation is hardest to cream, and likewise hardest to separate with an inferior separator.

Moreover, cream and butter prices are highest, so that the waste of gravity setting or a poor separator counts for most.

Then there's the sweet, warm skim-milk for stock feeding, alone worth the cost of a separator in cold weather.

There is surely no reason to delay the purchase of a separator or to continue the use of an inferior one.

You can't afford to wait until next spring. Let the De Laval start saving cream for you right now and it will earn its cost by spring. See the nearest De Laval agent at once, or if you do not know him, write us direct for any desired information.

DE LAVAL DAIRY SUPPLY CO., Ltd.

LARGEST MANUFACTURERS OF DAIRY SUPPLIES IN CANADA.
Sole distributors in Canada of the famous De Laval Cream Separators and Alpha Gas Engines. Manufacturers of Ideal Green Feed Silos. Catalogues of any of our lines mailed upon request.

MONTREAL PETERBORO WINNIPEG VANCOUVER
50,000 BRANCHES AND LOCAL AGENCIES THE WORLD OVER

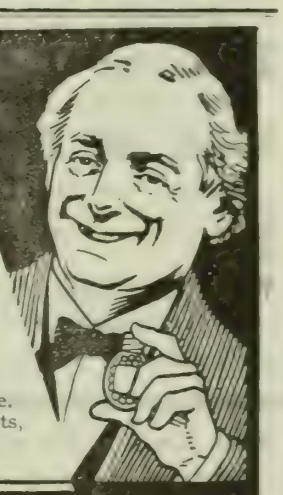
Dairy cows turned out to graze during the middle of the day in July and August, when the weather is extremely hot, with no shade or shelter from the sun's hot rays, will invariably show a marked falling off in their milk.

Constipation--

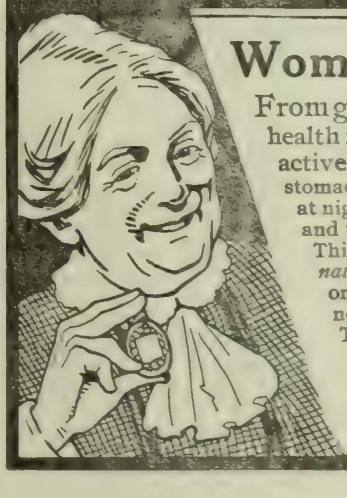
THE BANE OF OLD AGE

is not to be cured by harsh purgatives; they rather aggravate the trouble. For a gentle, but sure laxative, use Chamberlain's Tablets. They stir up the liver, tone the nerves and freshen the stomach and bowels just like an internal bath.

Old age should be the most pleasant time of life. You can make it so by using Chamberlain's Tablets, and ensuring regularity and good digestion.



CHAMBERLAIN'S TABLETS



Woman's best friend.

From girlhood to old age, these little red health restorers are an unfailing guide to an active liver and a clean, healthy, normal stomach. Take Chamberlain's Stomach Tablets at night and the sour stomach and fermentation, and the headache, have all gone by morning. This old, reliable remedy supplies the gentle *natural* cleanser that a woman's delicate organism needs. Not harsh, but sure—not habit-forming but Nature-building. Try Chamberlain's Tablets to-day.

LIVE STOCK.

GRAIN MIXTURE FOR CALVES

The thriftiness and rate of gain made by young calves depends very materially upon the kind and amount of grain consumed by them. If properly managed, an average calf will begin consuming grain at 10 days or two weeks of age. The grain is not furnished to supply protien to the young calf, as an adequate suppl yof this nutrient comes from the skim milk fed. The fat, however, has been removed from the milk, and a supplementary material must be furnished. The use of home-grown grain is advisable in the feeding of all classes of live stock for which it is adapted. Such grains as corn, oats, barley, and kafir are excellent feeds for the young calves. Ground corn and oats, half and half by weight, form a splendid dry mash. The use of mill by-products is not recommended unless special quality in the growing calf is desired, regardless of cost. Wheat bran may be substituted for ground oats if oats are not available or are less economical.

The young calf will consume a very small amount of grain at first. It may be encouraged to eat this class of feed by placing a small amount of the dry meal in its mouth immediately after feeding the milk ration. The grain may be placed in a small box at a convenient location in the calf's stall, and thus stimulate the calf's appetite for dry feed. The meal should always be kept fresh and sweet by frequent changes. After the calf is two months of age it should be required to consume this grain immediately after feeding. After the calf is two or three months of age whole grains may be fed with as good results as the ground feed.

WHY BREEDERS SHOULD USE THE TUBERCULIN TEST

Tuberculosis presents to every dairyman and cattle breeder a problem that is becoming more and more acute. The herd that is free from the disease now may not be after the purchase of another animal. The time for the farmer whose herd is still healthy to take up the question is before any more animals are purchased.

It has been shown that disease organisms in the milk of tubercular cattle are able to produce tuberculosis in children. It is estimated that out of every fourteen cases of tuberculosis in men, one is due to infection through the consumption of contaminated dairy products. At least one herd out of every four has this disease.

It is true that the milk of herds in which there are tubercular animals must be used as human food, but neither by the farmer himself nor by others should it be used until it has been so treated by heat as to kill any tubercle bacilli it may contain.

A herd is free from tuberculosis or it is not. In the first instance the effort should be to keep the herd free, and in the second to free it from tuberculosis. In either case the farmer must rely upon the sole method we possess for the detection of the disease in its earlier stages—the tuberculin test. Even this is not infallible.

The first step is to determine the condition of the animals by applying the tuberculin test to the entire herd. If all the animals have been in the herd for some months, and no evidence of the disease is detected by the tuberculin test, the owner may be quite certain that the herd is free from it.

The most frequent manner by which the disease is introduced into the herd is by the purchase of an infected animal. This may be avoided largely by applying the tuberculin test to the animal purchased and by learning the previous history of the herd. At the beginning—the so-called "period of incubation"—the tuberculin does not produce the characteristic fever by which the disease is recognized, but if the history of the herd shows that but few cases have been present within recent years the purchaser may be assured that the non-reaction is almost positive evidence that the animal is free from disease.

Eureka Potato Digger

Gets the Potatoes and separates where no other digger can

A strong statement, but an actual experience many times, saving growers more than the cost of the Digger. Ask us for the proof.

The Eureka elevator and duplex shaker provide more separation than other diggers. Large wheels and main gears supply ample power. Mostly malleable and steel, avoiding frequent breakage and lost time. Growers report digging 80 or more acres without repairs. High clearance over shovel prevents weeds and vines bunching. Has vine-turner attachment.

6-ft. and 7-ft. sizes; several styles.
Prompt shipments from distributing points.

The purchaser may insure himself to a high degree against trouble by testing the animal at time of purchase, by keeping her out of the herd for sixty days, and then applying a retest.

Some who are enlarging their herds by purchase will not succeed in keeping tuberculosis out in spite of all precautions, but if the entire herd is tested each year it is very probable that the disease will not spread to any extent between the time of the introduction of the animal and the next test. Thus no considerable losses will be met.

The elimination of tuberculosis from a herd may be an easy task or a difficult one. If fifty per cent of the animals are found to be tubercular it is usually wise to handle the herd as though all the animals had been found diseased, since those that do not react to the test have the disease in such a stage that the tuberculin will not detect it. From such a beginning a healthy herd can be obtained by removing the calves at birth from the herd and feeding them on milk that has been heated.

When a smaller percentage of the herd is found tubercular the reactors should be removed, and the other animals retested at intervals of 6 months until no more tubercular animals are found, and at yearly intervals thereafter. When you attempt to get rid of tuberculosis, persist!—E. G. Hastings.

CHOOSING A GOOD SIRE

In selecting a ram, keep in mind that the ultimate object of raising sheep is the production of mutton and wool. Different conditions make necessary different types of sheep, so that no one breed or type will fit all conditions. One likes to see a mutton ram with a strong, broad nose, bold front, and a short, strong neck. These masculine characteristics indicate prepotency—that is, the ability to stamp his characteristics on his offspring. A clear skin indicates a vigorous and healthy condition. Excessive fat is not advantageous; frequently it is a detriment. A medium condition of fat is most desired.

The fleece deserves more attention than has been given it. If one can increase the shearing quality of his flock 5 per cent without injuring the mutton quality, that much is gained. A good shearing fleece should be dense, of good length, and have a soft, elastic feel, indicating a healthy condition. A dead, harsh, dry feeling fleece should be avoided.

The use of a good sire is one of the recognized principles of improving live stock. This principle is fundamental. However, some breeders, through neglect or a lack of knowledge and interest in improved types, use sires which retard the general quality of their flocks and herds. A good, strong yearling ram should be able to serve fifty ewes. A good ram when used on a flock of grade ewes is in many cases more than half the flock, because he will usually have greater ability to stamp his character on the offspring than will the ewes. So with a small flock of grade ewes, worth from $8 to $10 per head, one can afford to purchase a good mutton ram. As the value of the ewe flock increases one can afford a higher class ram. It is economy to have a ram of superior character at the head of the flock.—Breeder's Gazette.

"Kent Flour is Some Flour"

KENT MILLS GOLD MEDAL FLOUR

QUALITY STANDARD FOR 30 YEARS

From a small beginning thirty years ago, but with a fixed purpose—and that was that the product of the "Kent" mills should be the finest flour that the finest of Canadian wheat could produce—the output of Kent Flour has increased from a few barrels a day by the old millstone process to an output of over two hundred thousand barrels a year by the most improved machinery known to millers to-day.

In a generation the demand for Kent Flour has increased from a most limited local sale to a trade that includes all Canada; from the time when all customers could be supplied in a short haul by the local mill delivery to a sale in 1916 that means train loads east, west, north.

"Quality" has been the keynote to a success and reliability and uniformity that have made Kent Flour a household word.

Kent Flour has always been ground from the finest blends of Canadian wheat—and always will be—and that is why it produces bread, cakes and pastry, that are a delight to the housewife.

All reliable dealers sell Kent Flour.

Sold in 24, 48 and 98 lb. sacks. Half Barrels and Barrels.

There's a treat waiting for you when you use "KENT" Flour

The Canada Flour Mills Co. Limited

DOSING A HOG WITH AN OLD SHOE

In addition to what was said in the issue of July 21st of the Ottawa Valley Journal in a spicy little article under the title "How to Dose a Hog," the following plan is offered which is easy and as safe as any plan that can be used: Take a ⅜-inch rope with a loop or ring in one end, slip this into the hog's mouth just back of the tusks. The animal will then pull backward. Next take an old shoe, cut the toe out so that the medicine will run through, put the shoe into the hog's mouth, and pour the medicine into the shoe. The hog will chew away at the shoe and swallow the medicine with comparatively little danger of harm. In the operation it is better to have a helper than to fasten the rope to a post, for the helper can raise and lower the head and not pull harder on the rope than is necessary. Do not raise the rope head higher than necessary to cause the medicine to go down, and do not pour in too fast.

However, the drenching of a hog is always a somewhat serious operation, and should never be undertaken if the animal will take the medicine with food, which it will usually do if starved for a day. The best practice, however, is not allow them to get sick by giving them such food, care, and management as will secure to them almost certain freedom from sickness or disease.

Home butter makers are apt to forget that butter worked too warm is unsatisfactory in color and flavor. Watch the temperature.

Dr. Cassell's Instant Relief

LIVER TONICS
ANTACIDS
CARMINATIVES
LAXATIVES

Prepared by

Dr. Cassell's Instant Relief is the companion preparation to Dr. Cassell's Tablets.

Liver Troubles, Sick Headache, and Habitual Constipation.

Liver troubles and habitual constipation can be cured—but not by cathartic or purgative medicines. The only possible way is to help your system to cure itself; and that is what Dr. Cassell's Instant Relief so surely does. It is not cathartic, it is not violent, it is quite different to the coarse purgative preparations in common use. These only irritate and weaken; Dr. Cassell's Instant Relief tones and strengthens the liver and bowels, and so restores their power to do nature's work in nature's way.

Take Dr. Cassell's Instant Relief for constipation, biliousness, liver troubles, sick headache, flatulence, acidity, heartburn, and impure blood.

Ask your Druggist for Dr. Cassell's Instant Relief and take no substitute.

Price 50 cents from all Druggists and Storekeepers,

or direct from the sole agents for Canada, Harold F. Ritchie and Co., Ltd., 10. McCaul-street, Toronto. War Tax, 2 cents extra.

Sole Proprietors: Dr. Cassell's Co., Ltd., Manchester, England.

PROOF

"Science Siftings," April 11, 1916, says—"Providence has given us the brains to devise means to compensate Nature for our ill-treatment of her. . . . The means at hand come from natural sources, and we have them embodied in such splendid combination as Dr. Cassell's Instant Relief. We take this preparation as an example because it is so well balanced in the matter of components and so effective in every direction."

Was Troubled With CONSTIPATION FOR OVER FIVE YEARS.

Unless one has a free action of the bowels, at least once a day, constipation is sure to ensue, then in the wake of constipation comes sick headache, bilious headaches, jaundice, piles, and many forms of liver complaint.

Milburn's Laxa-Liver Pills will regulate the flow of bile to act properly upon the bowels, thus making them active and regular, and removing the constipation and all its allied troubles.

Mr. Phil. G. Robichaud, Pokemouche, N.B., writes: "I have been troubled with constipation for over five years, and I feel it my duty to let you know that your Milburn's Laxa-Liver Pills have cured me. I only used three vials, and I can faithfully say that they have saved me from a large doctor's bill."

Milburn's Laxa-Liver Pills are 25 cents per vial, or five vials for $1.00; for sale at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

THE HORSE

SHOEING PADDLING HORSES

A four-year-old trotting colt is well bred and of good size, but is "nigger-footed." How shall I have him shod? I would like to improve him for driving.—B. J. S.

A horse with "nigger heels" should have its feet lowered from the toe back, on the outside, at each shoeing. "Nigger heels," paddling, winging, toeing in, and knee knocking all result from neglect save in rare instances. The feet of foals and young horses need regular attention. The average right-handed blacksmith will use his rasp more easily on the same side of each front foot and often cause a horse to hit its off knee. The right foot is the one generally marked. Confirmed "nigger heels" in a mature horse are hard to correct. At speed such a horse will hit his knees and require a metal-lined foot. A toe weight helps to true the action, but the safest plan is to heed the maxim of the old-time Vermont horseman, father of a noted driver of today: "Never have anything to do with a horse that toes out or a woman that toes in." Doubtless the first half of the maxim is all that any Gazette reader would require.—Breeders' Gazette.

TRAINING DRAFTERS TO WALK

A draft horse which walks badly is likely to be turned down at a show; the drafter's gait is the walk. It is not always easy to develop the walk in a high-fed horse, or get it to show the walk at the proper time. Perhaps we should get along better if we cosnidered the matter from the horse's point of view.

The stallion in hand is a more natural animal than in harness. Horses do not often walk when anxious to go somewhere. The walk is preliminary to the trot and the trot to the canter or gallop. A high rate of speed at the walk is not natural to the horse. He breaks into a jog which he can keep up indefinitely without fatigue. When he takes a walk it is in the nature of a stroll. A horse should be taught to walk as perfectly as a saddler is taught to single-foot or canter. If this is to be developed the horse must be walked when fresh and full of the forward impulse. The show horse is an actor. His part must have been learned at rehearsal. When he comes before the public he must stand and walk as an art. The more impulse there is to action and the faster the movement the better. Let the horse show that he is ready and fit for anything, but that he awaits his cue. Nothing looks worse than an effort at education in the show ring. Judges know that horses should be trained before they enter the ring. If the horse does not do it it will be assumed that he can not.

A walk that springs from hock action, with the iron flashed at every step, demands condition. The horse must be well collected, with the hind quarters well under, which brings the fore quarter to a good carriage, and we get the effect of a contained power that would find its limit in the strength of the harness rather than the weight of the load. A draft horse at a fast, collected, well-poised walk is as grand a thing as moves. Adrafter than can not walk and show pride in the accomplishment, but must ape the trotter, is a vain thing and futile, like the frog that tried to blow itself up to the dimensions of the ox, or a nightingale that would trade his voice for a peacock's feathers.—L. Ogilvy, in Breeders' Gazette.

OVERHEATED HORSES

On some farms horses are never overheated; on others it is the common thing in summer for one or more horses permanently to be injured or even killed outright by heat. The difference is in the care of the horses, and mainly in the feeding, watering, and stabling. Horses that are skilfully and watchfully cared for in summer, so as to keep them in the best of health and vigor, can endure a degree of exertion in the hottest days that would strike down an ill-nourished, weakened animal. If a horse gets too hot to eat it is time to look after him and not wait until he plays out the next day. It takes a big daily supply of grain to furnish the energy for hard work in hot weather. Without that energy the horse gets weak and is also less able to get rid of the surplus heat from exercise.

When horses are working in hot weather and sweat suddenly stops it is time closely to examine them. If the horse's hair is dry when expected to be wet, and he is panting rapidly, or if he staggers when walking and braces the legs when standing, with a general appearance of depression, he has been pushed ahead too long. Before the animal gets worse off than that it is best to get him into the shade. If the signs of distress continue, or if the horse has gone down, the usual course is to wash him all over with water, apply cold water or ice to the head, and cold water to the legs. A good home stimulant for such cases is 2 ounces of aromatic spirits of ammonia, or 2 ounces of sweet spirits of nitre in a pint of water; or give a pint of warm coffee. These are the measures especially recommended to teamsters by the Boston Work Horse Relief Association.

Careful attention to the health of horses in hot weather, and watching for the first danger signals in the field, enable some of the greatest hustlers with farm operations to get a surprising amount of harvest work done with each horse, and without ever killing one from heat. It pays to be careful and to anticipate hot weather trouble so as to prevent it. An overheated horse is a poor piece of property, and the overheating can be avoided.

THE COLT'S FIRST SUMMER

Gains during the first year of the colt's life are cheaper than at any other time. Attention to feeding and exercise may reduce the cost even more than usual.

The colt should be encouraged to eat a little grain as soon as he shows any inclination for it. Usually he will begin to eat when he is about a month or six weeks old. A mixture of equal parts of crushed oats and bran makes a nice feed. Only as much as the colt will clean up nicely should be fed. It is not well to try to keep the troughs filled. Some fresh skim milk may also be fed to advantage if only a little is given at a time.

Following his mother in the field when she is at work takes too much of the colt's energy. He is better off in a dark barn away from the flies during the day, if he is turned out to exercise at night. For the first six weeks he should be allowed to suck about the middle of each morning and afternoon. If handled in this way the colt may be weaned when four or five months old without missing the mother's milk and without losing the colt fat that should be kept on his back to carry him through the first winter.

With present market prices every colt of good draft breeding ought to return a good profit if fed so as to make the maximum development.

FEEDING FARM HORSES

Experiments have been carried out with the object of ascertaining the relative value of various rations for farm work horses in respect to the following points:

(1) Maintenance of weight; (2) health, spirit, and ability of horess to endure hard work. The economy of each ration was also considered. The following were some of the conclusions reached:

1. Clover hay is quite as efficient as, if not a little superior to, timothy hay for horses at hard work, when a mixed ration of maize, oats, oil meal, and bran is fed.

2. Both kinds of hay had a similar effect on the spirit of the horses. Those receiving clover, however, had a glossier coat.

3. When clover is used as a horse food the quality should be good, and a limited quantity should be fed.

4. Where lucerne hay is the fodder supplied to farm horses at hard work, less grain is necessary to prevent them from losing weight than when timothy is fed.

5. A saving of about 10 per cent may be made by grinding the grain of farm horses when at hard work.

Farm horses at hard work should receive 1 1-5 lbs. of grain, and from 1 to 1 1-4 lbs. of hay per 100 lbs. of live weight per day in order that their weight may be maintained.

Doctor Said Only Hope Was in an Operation

Was Skeptical When He Began the Use of Dr. Chase's Ointment—Relief Came Quickly.

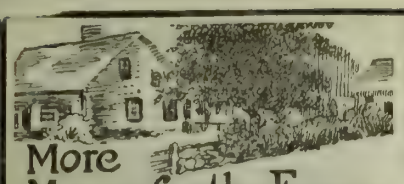
Here is a plain, honest statement in regard to Dr. Chase's Ointment. Between the lines of this letter you can read the gratitude which its writer feels. One does not suffer from annoying, distressing piles for ten years without appreciating a cure when it is obtained.

Almost every mail brings the report of some one who has been cured of piles by the use of Dr. Chase's Ointment. Such statements are never used without the permission of the writer, and until we are satisfied that the cure is genuine and the writer a person of responsibility.

You may believe in operations for piles, and think there is no other cure. Write to Mr. Ingles, enclosing stamp, and he will gladly verify his statement. He will tell you that the pain, the expense, the risk of an operation are quite unnecessary. That relief and cure come with the use of Dr. Chase's Ointment.

Mr. Ernest W. Ingles, Pindicton, B. C., writes: "I suffered from piles for ten years, and though I tried all kinds of ointments and injections I really had no permanent relief until I used Dr. Chase's Ointment. When I began this treatment I had absolutely no faith in it, for I had been examined by a well-known physician in Vancouver, and he said that an operation was the only thing that would benefit me. It was surprising the relief I obtained from the very first box, and now after using four boxes I am practically cured. My case was so exceptionally bad that I received no relief day or night, and for this reason the results are wonderful."

You can obtain Dr. Chase's Ointment from any dealer at 60 cents a box. If you do not want to risk this much send a two-cent stamp to pay postage, and mention this paper, and we shall send you a sample box free. We are so certain that any sufferer from piles will obtain relief by using this ointment that we do not hesitate to make you this offer. Edmanson, Bates & Co., Limited, Toronto.



More Money for the Farmer

WHEN live stock is tormented by vermin, lice, mites or flies, it cannot be profitable. You can prevent this annoyance and have more profitable stock by using Creonoid. Think this over. It means money for you.

CREONOID

Lice Destroyer and Cow Spray

Creonoid stands alone as a lice killer and cattle spray. Economical too, because it is so strong that a little goes very far. Give your horses and cattle a fine, long distance spraying, so that they get the vapor. It will make them clean and vermin free. Put some Creonoid in the hennery and piggery. The use of Creonoid means better stock, more eggs, more good porkers, more milk. Try some now.

PILES CURED at HOME by NEW Absorption Method

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers. Box P. 309 Windsor, Ont.

St. Isidore, P. Q., Aug. 18, 1894.

Minard's Liniment Co., Limited.

Gentlemen—I have frequently used MINARD'S LINIMENT and also prescribe it for my patients always with the most gratifying results, and I consider it the best all-round Liniment extant. Yours truly,

DR. JOS. AUG. SIROIS.

DETERMINING SEX OF DAY-OLD CHICKS

With the rapidly growing day-old chick industry the question of sex determination naturally arises. Many buyers would like to order all pullets, all cockerels or a given number of each, and would be glad to pay an additional price for this assurance.

The sex of Barred Plymouth Rock chicks can be told with a reasonable degree of accuracy. The pullet has a dark, willow-colored beak, sometimes streaked with black. It is of finer bone than the cockerel and the legs are dark and smoky colored. The cockerel has bright yellow legs and beak and usually a coarse head and prominent eye. The cockerel is a gray or slate color, while the pullet is darker. The white tip of the wings and spot on top of the head are more noticeable on the pullet, due to the contrast with the deeper black. This means can only be used to denote the sex the first couple of days. After this time they all take on the one characteristic blue color, the beak and legs of the pullet fade out to yellow.

Similar methods can be employed with all parti-colored breeds. With solid-colored birds the best means of determining sex is the prominent cockerel.—C. S. Anderson, Colorado Agricultural College, Fort Collins, Colorado.

SURE DEATH TO MITES

The common red mite which is most active during the warm weather is commonly found about the roosts and dropping boards also about the nests, and many times in brooders and coops for the hen and her chicks. The mite is easily held in check if proper methods of control are used. While kerosene will quickly kill them, it evaporates in a few days.

Any of the coal tax mixtures are more effective. Carbolenium is recommended highly by the Connecticut station. Containing a coal tar product and carbolic acid, it acts as a wood stain and remains effective for a long period of time, being even more effective than pure carbolic acid. One application a year is generally sufficient, but it must be used with discretion.

An excess amount either on the roosts or on the adjoining boards may result in eye trouble to the hens or chickens. To avoid this it is best to make the application when changing the chicks from one house to another, allowing at least two days for the mixture to dry before using the house. If this cannot be done dilute it with kerosene and apply lightly with a brush.

If roosts are allowed to dry outside of the poultry house there is less danger of injury to the fowls. The roosts should be removed and painted, the roosting boards thoroughly cleaned, then painted being sure to use the carbolenium very liberally in the cracks between the boards. In badly infested houses or where mites shows signs of returning, it may be necessary to make a second application.

MEAT AND BONE

The chicks need considerable ash or mineral matter in their ration in order to make a satisfactory growth. This material goes into the formation of bone and skeleton. They must also have considerable protein or nitrogenous food material to go into the formation of lean meat. The ash or mineral matter can be supplied in the form of dry granulated bone, which can be purchased for about $2 a 100 pounds. It contains approximately 25 per cent protein and from 23 to 25 phosphoric acid. The additional quantities of protein can well be supplied in the form of meat scrap. The protein in this can be purchased for about 5 cents a pound. Only a high grade meat scrap carefully rendered and containing from 50 to 55 per cent of protein is advisable to use.

THE UNSPOKEN DREAD

As Sir Anthony cracked a nut for Lady Sotheran, he turned to her aunt, Lady Ullswater.

"And where does your son, Oscar, hide himself nowadays?" he said. "Every time I've been to Ullswater Hall of late I've had the ill luck to find him out, or gone away, or not up, or indisposed, or something."

There was a pause all round the table.

Lady Ullswater's fingers were trembling, and she was biting her lips. At the foot of the table old Peter Lucas, a connection of hers through marriage, lifted his white brows nervously up and down. Lady Ullswater broke the curious silence at last.

"Hide himself!" she said, with a forbidding note utterly foreign to her gentle character. "How do you mean hide! My son, Oscar, is studying hard just now—too hard, I think"—her voice trembled as she spoke—"and shuts himself up in his own room. In the morning he is tired—and lies in bed."

"So we—we don't see quite as much of him—as we—as we used to," concluded Lady Margaret. Sir Anthony felt more than saw, for he did not like to look straight at her, that an expression of great pain had come into her face.

"I should like to show you a wonderful piece of embroidery my grandmother did when she was a little girl," broke in Lady Ullswater, in her usual brisk manner. "I unearthed it yesterday from an old chest, and it's really a marvelous work of art for a child of fourteen. It's in the drawing room. Shall we go and inspect it, Margaret, and leave Sir Anthony and Peter to their wine?"

A pause followed on the withdrawal of Lady Ullswater and her niece. Sir Anthony, thrown into confusion by the effect that his casual observation had created, turned cautiously to old Mr. Lucas when the servants had left them alone.

"Anything up with Oscar Howden?" he said, in a low voice.

Old Old Lucas shook his head and looked round him, lowering his voice, too.

"No—no, not at all, as far as I'm aware," he said.

Sir Anthony fell into an abstraction from which the old man took no pains to rouse him. He could not understand the thing. He had known the Ullswaters for long years, and his tried friendship had been rooted in many of the family chances and mischances. He remembered the death of Lord Ullswater, the coming of age of Oscar. He was at Ullswater Hall when Margaret Sotheran left an orphan and an heiress, came as a girl of seventeen to live with Lady Ullswater, her aunt. He had seen Margaret and Oscar gradually falling in love with one another, seen their attachment tested in a hundred ways; he had been the first to hear of their engagement. There was nothing, he flattered himself, about the Ullswater affairs which he had not known for weeks before report gave it as current gossip to the world. Lately Sir Anthony had been abroad, but kept up his regular correspondence with the family. There was no mention in their letters of any strange development in Oscar's character or life, and when, on his return, he visited Ullswater Hall there was still no indication of anything amiss, except that latterly, as Sir Anthony remarked, he had seen nothing of young Howden every time he called.

At this point old Mr. Lucas rose, suggesting that it was time to join the ladies. As the old man opened the drawing room door Sir Anthony turned back into the hall, remembering that he had left a letter in his breast pocket, when he heard a door shut behind him. He turned, and saw Oscar Howden coming toward him. Oscar stopped short when he saw Sir Anthony, and made as if he were going to turn back. Then he seemed to change his mind, and advanced upon him rapidly. Sir Anthony noticed his expression immediately, which was at the same time dreamily abstracted and nervously excitable. The eyes had a fixed, far-away look, yet they were full of fire. The skin of the face was drawn and white—the look almost of dead flesh—and there was a muscular tension round the mouth.

Opium! Sir Anthony said to himself. Then he rebuked himself for the thought. "Hello, old chap!" he said affectionately to Oscar. "I haven't set eyes on you for I don't know how long."

"Yes—I know. How are you?" Oscar replied, without the faintest note of interest in his voice. He advanced with a hurried step to the hall door, buttoning the overcoat which he was wearing round his throat. Sir Anthony caught the sound of the chink of iron or steel. He did not even loo kat him. "I'm—I'm in rather a hurry," Oscar continued, opening the door. "Excuse me, won't you, old man?"

He stood a second on the doorstep, pulled the door to behind him, and went out into the night.

Returning to the drawing room, Sir Anthony found Lady Margaret sitting at the window by herself. She turned her head as Sir Anthony entered the room with an expression of anxiety on her face. He crossed the floor and sat down beside her.

"This is the letter from my mother about the poor girl in whom you are interested," he said quietly. "Read it; it will tell you——"

"Did some one shut the hall door just a minute ago?" she said.

Sir Anthony hesitated. Then he answered: "Yes, it was Oscar. He went out."

Lady Margaret made an exclamation, and the look of anxiety deepened in her eyes.

"There!" she said, under her breath "Now it all begins again."

Sir Anthony, who had always cared for Margaret in another way perhaps than that which was obvious to outsiders, watched her face for a moment before he said:

"What begins again?"

"The anxiety," she said. Sir Anthony paused. Then he leaned forward and lowered his voice.

"Margaret," he said, "is everything between you and Oscar just—just as it used to be?"

Her eyes filled with tears. "With me—just, just the same," she answered.

"And Oscar?"

"Oscar has changed," she said, in a low voice. "Anthony," she continued, "I've not said a word to any one but you; but you don't know how troubled we are about Oscar. You know what—what he used to be to me—what we were to each other——"

"I know—I know," said Sir Anthony.

She looked up suddenly with her young face lined with anxiety.

"You're sure it was Oscar who went out?" she said.

"Why, certain," he answered. "I saw him."

She wrung her hands. "I shall never sleep" she said, "not knowing where he is."

"But he'll be back in an hour or so," began Sir Anthony. "I expect he's only gone into the park."

"He won't be back," she whispered.

"What d'you mean?"

"It's always happening," said Lady Margaret. "Over and over again. He disappears for days. He tells nobody. Nobody knows where he goes. And he's—he's so strange, we daren't say anything to him."

"But how long has this been going on?" Sir Anthony inquired.

"For some months," said Lady Margaret.

Sir Anthony did not know what to say. Her distress and the cause for it were so real that an attempt at consolation seemed a mockery. "Never mind Margaret," he said after a pause. "It's bound to come right in time—whatever it may be—and things between you and Oscar will be just as they always were."

Lady Margaret sighed heavily. "But he's been so different to me and to Aunt Marion for so long now," she said. "His manner even is changed to us—he doesn't seem to care—about—about anything now. The least little thing makes him irritable. To give you one instance out of a hundred: We were walking in the park last night, and I tried to climb the big tree that overhangs the paved walk near the shrubbery—you know, you can see it from my room. I saw he didn't like it, and as I was jumping down again I laughed and said I was sure the ground was hollow underneath—it had such a hollow ring. He turned on me and said he didn't like to see me talking and behaving like a silly schoolgirl—I was too old for that—and women were such a pack of fools——" She broke off, and looked appealingly at Sir Anthony. "It seemed an innocent remark," she said. "What harm was there in it? But he was so irritable to me that Aunt Marion had to speak to him."

The wind, which had risen suddenly, drove a sheet of rain against the windows and shook the old house in its grasp. "Listen!" said Lady Margaret. "To think of him out in that! If he is out——" She broke off, and turned her grey eyes, filled with sorrow, full on his face. "Anthony," she whispered, "from what I've told you, you don't think—you don't think it's another woman?"

"I don't believe it for a second," Sir Anthony was saying stoutly when Lady Ullswater crossed the room to him.

"You'll stay the night with us, Anthony," she said abruptly, "won't you? I don't like to think of you out in a storm like this. Peter has gone. I couldn't persuade him to stay But you'll not leave us tonight?"

Sir Anthony glanced at Lady Ullswater's face. It was harassed and worn.

"Thanks awfullyy, Lady Ullswater," he said gravely. "I'd rather stay the night than turn out into the storm." For he understood that Lady Ullswater was making an appeal to him.

All that night the wind howled and the rain came down. The morning broke more quietly, but still in a sheet of rain. Sir Anthony, who had not slept well, owing to the storm, left his bedroom early. Going along the corridor, he met Lady Margaret, her hair loose, a dressing gown about her, hurrying toward him.

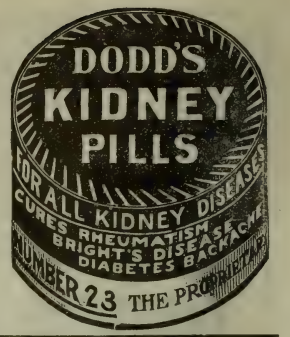
"What a night, Anthony!" she exclaimed. "I scarcely slept at all, did you? And I kept on hearing such strange noises in the storm—I'm sure the house is haunted."

Sir Anthony smiled. "What sort of noises?"

"Horrid subterranean noises," she said, "as if all the wicked spirits of the underworld were trying to dig a way out into this world." She stopped and turned to him. "Did you hear——" she began. Sir Anthony knew what

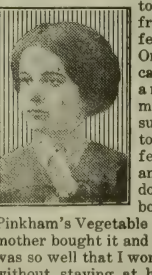
A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations bladder weakness constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, lesire to cry. palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health. strength, and happiness by this method. Write today. Address: Mrs. M. Summers Box 309, Windsor, Ont.



GIRL COULD NOT WORK

How She Was Relieved from Pain by Lydia E. Pinkham's Vegetable Compound.



Taunton, Mass.—"I had pains in both sides and when my periods came I had to stay at home from work and suffer a long time. One day a woman came to our house and asked my mother why I was suffering. Mother told her that I suffered every month and she said, 'Why don't you buy a bottle of Lydia E. Pinkham's Vegetable Compound?' My mother bought it and the next month I was so well that I worked all the month without staying at home a day. I am in good health now and have told lots of girls about it."—Miss CLARICE MORIN, 22 Russell Street, Taunton, Mass.

Thousands of girls suffer in silence every month rather than consult a physician. If girls who are troubled with painful or irregular periods, backache, headache, dragging-down sensations, fainting spells or indigestion would take Lydia E. Pinkham's Vegetable Compound, a safe and pure remedy made from roots and herbs, much suffering might be avoided.

Write to Lydia E. Pinkham Medicine Co., Lynn, Mass. (confidential) for free advice which will prove helpful.

Try an Ad in the FARMER

she meant to add—if Oscar had come back. He shook his head. "I'm going to look in his room," she said. They turned together and looked down the long passage. "His door is open," she whispered. "He may have gone down stairs."

But when they had all assembled in the breakfast room it was only too apparent from the air of reticent anxiety in all that Oscar Howden had not returned.

The day wore on; still there was no trace of Oscar, and Sir Anthony spoke to Lady Ullswater about getting home. He saw the harassed look come back into her face.

"I wish you'd stay with us a day or two, Anthony," she said, in her reserved voice. "My son, Oscar, is—is away—on business—and since my husband died I've never got accustomed to living in a house without a man."

Again Sir Anthony deferred his plans, for it seemed to him it was his duty to stand by Lady Ullswater as long as she had any need of him. All morning Lady Margaret looked restless and unhappy. After lunch it was evident that she could bear the uncertainty no longer. She said that she must do something; she was going to visit the poor women in whom she and Sir Anthony's mother took an interest. The woman lived in the village, which was a mile or two away. Lady Margaret said she would be back in time for dinner.

Just as the first gong went at half past seven that dark winter's night Oscar Howden came back. Lady Margaret was upstairs changing her dress. Sir Anthony, who knew of his return, watched her face when they were sitting down to soup and the door opened and Oscar came in. It flushed all over with relief and surprise, but she said nothing. Lady Ullswater looked a different woman now that the suspense for the time being was gone. Sir Anthony thought the behavior of the two women, so charged with an inner relief which was strenuously concealed, profoundly touching. The servants, too, showed not the faintest curiosity at his reappearance, nor did anybody by the least sign betray the anxiety and alarm which they had recently been through.

In order to relieve the general nervous tension Lady Margaret began to talk about the woman in distressed circumstances whom she had visited that afternoon.

"Such an intelligent woman, too," she said; "quite well informed and interesting to talk to. And, by the way, she asked me if I'd ever heard the old legend about this house."

"Legend?" said Sir Anthony, to prolong the impersonal conversation.

"I shouldn't listen to the superstitious tattle of the village woman, Margaret, if I were you," Oscar remarked suddenly and rather rudely.

She tried not to look hurt, but Sir Anthony now saw what Lady Margaret meant by what she called Oscar's habit of "falling upon her."

"Yes; a curious legend about the old Romans and Ullswater Hall. You Know," she turned to Sir Anthony, "the old Roman remains about a mile from here? That made me wonder if there mightn't be some truth in what she said. She told me it was commonly believed that when the old Romans came over here as conquerors they captured a princess of the Iceni tribe, who was marvelously beautiful. It was said she led her people out to war and that a Roman general, seeing her courage and loveliness, fell violently in love with her, and bribed a serving woman to betray her into the hands of his soldiery——"

"I wonder you can listen to such nonsense," Oscar broke out, almost savagely. Before his aspect toward Margaret had been utterly indifferent, now he looked as if he almost hated her. Lady Ullswater turned quietly to him with rebuke in her eyes.

"Go on, please, Margaret," she said; "it is extremely interesting."

Lady Margaret went on, though his

CANADIAN GOVERNMENT
USES
500,000 Square Feet of Paroid

A Real Recommendation of a Real Roofing

The Government authorities, by the use of over half a million square feet of Neponset Paroid Roofing in Camp Borden and for the military barracks at Hamilton and at Halifax, fully endorse the preference of thousands of farmers and builders all over Canada for

NEPONSET Paroid ROOFING

Hundreds of Paroid Roofs—18 years old and upwards—prove the durability—and economy, too—of this fire and weather-resisting roll roofing. It is the least expensive roofing in the world, because it gives such long, hard service under the MOST TRYING conditions on farm buildings, factories and railroad buildings.

LOOK FOR THE PAROID ROLL

Paroid is sold by over two thousand Neponset dealers in Canada. It is made in three colors—grey, green and red. Saturated through and through with asphalt, it will not dry out, curl up, split or crack, and will not run in the hottest weather.

RED ROSE TEA "is good tea"

contempt had taken the assurance from her manner.

"She told me that he was supposed to have built a subteranean chamber to hide her in, for fear her people, who idolized her, should find her whereabouts and steal her away from him. She said that he shut her up there, down in the earth, and that he bound her to an altar, and visited her secretly at night, inflicting tortures on her to make her say that she would marry him."

"A very curious legend," said Sir Anthony. He was watching Oscar Howden, who at this point was listeninfi to what Lady Margaret said with a kind of suppressed excitement in his eyes. Lady Margaret saw that she had interested him at last, and it gave her confidence to conclude.

"At last the poor princess went mad," she ended, "and after lingering miserably died in that dreadful prison underground. But the interesting part of it is: that she is supposed to haunt the cavern now, and sometimes you can hear her shrieking underground as they torture her. A long, long time ago—several centuries, I think—a former tenant of Ullswater is believed to have found the entrance to the chamber and sealed it up again. They say he saw the princess. And you can see her sometimes now, if you have the power, escaping from her prison at night. She is so beautiful that no man who has looked upon her can look upon another woman again. He cannot put the thought of her away from him, but he must seek her till he has speech with her, till he touches her. But if he kisses her he dies of the breath of her lips."

"Really!" said Lady Ullswater. "How strange, and rather terrible."

"Aunt Marion, did you ever hear the legend before?" said Margaret.

"Never," said Lady Ullswater. "It's strange, but I never have."

"I should think you haven't!" Oscar sneered. "Tales like that are only circulated and listened to by the sort of people who have nothing better to do than imagine a supernatural significance in the way a cat washes its face, or a horse shoe falls from an old horse." He got up from the table looking irritable and nervous, and Sir Anthony noticed that he was sufficiently annoyed to forget that he had left behind him a little brown paper-covered volume lying on the table.

"I don't know," said Margaret, under her breath, when he had gone. "I do believe in the reality of many things that most of us can't either see or feel."

As Lady Ullswater and Margaret went out after dessert, Sir Anthony possessed himself of the little book covered with brown paper and glanced at the title page. It was a pamphlet on the "Invocation of Spirits," by some one with several letters after his name. He put the book in his pocket.

Late that night Sir Anthony awoke with a feeling of excitement and uneasiness upon him. He rose and put on some clothes, went to the window and looked out. It was the wind, he supposed, which had prevented him from sleeping, for again the night was wild, and the trees were tossing in the park. A little tap sounded on his door. He went to it quickly, and looked out. Lady Margaret, fully dressed, was standing there.

"He's gone again," she said; and she wrung her hands. "His room is empty. Anthony, I want your help tonight."

"What can I do?" he whispered back.

"Just come into my room a moment," she said, her manner greatly distressed. "I've heard strange noises all the night, or thought I did. And I'm miserably uneasy about Oscar."

She pointed out of the window, and seemed to speak unconsciously.

"There," she said. "I knew——"

"Where?" he asked.

"That tree," she answered. "It's been telling me all night."

He looked at her cautiously, not certain that she was herself. Then she made a sudden movement and took Sir Anthony's hand. "Will you come—will you come with me?" she said.

"Yes, I will come; but where?"

"There—near that tree," said Margaret. "It knows something about Oscar. And I—I know it, too."

"How do you know?" he whispered, as they slipped downstairs.

"It is here," she exclaimed, "it must be here." And she went down on her knees in the drenched grass. Sir Anthony did not know what in the name of heaven she was doing. Yet somehow he dared, or could, not speak. "No further on," she muttered. Still on her knees, she dragged herself toward the paved walk of the shrubbery. Then she exclaimed: "Fresh earth! I smell it!" Her fingers were seeking feverishly in the darkness over the edges of the paving stones. "Here!" she cried.

"Where?" said Sir Anthony, stooping down to her. "What is it?"

"It is open," she answered, with a

DEPARTMENT OF THE NAVAL SERVICE.

NOTICE OF SALE

SEALED TENDERS, address d to the undersigned, w ll be received up to noon of the 1st October, 1916, for the purchase of the

Dog-Fish Fertilizer

to be produced at the Dog-Fish Reduction Works at Canso, N. S., and Clark's Harbor, N.S., during the season of 1916 The total quantity that will be produced is estimated at betw en 150 and 200 tons of 2,000 pounds

No particular form is necessary for use in tendering, but envelopes should be distinctly marked across the face, "Tenders for Dog-Fish Fertilizer."

The fertilizer will be put up in bags of 100 pounds each, and a charge of 15 cents will be made for each bag, additional to the price paid for the fertilizer.

Consistent with the price offered, tenders from bona fide agriculturists will receive first consideration; the right is reserved, however, to reject any or all tenders.

Tenders from non-residents of the provinces of Nova Scotia, New Brunswick and Prince Edward Island will not be considered and guarantees must be given that the fertiliz r will not be disposed of or used outside of these provinces.

Tenders should state the quantity required in bags, and the minimum quantity acceptable at the price offered, and from which point it is desired shipment should be made. The price offered should be on the basis of so much per 100 pounds.

Terms of s le are cash within ten (10) days of acceptance of tender fo specific quantities, all charges for transportation from Works to be borne by the purchaser Failure to remit within the time specified will result in the cancellation of tender without further notice, and the allotment being diverted to the next highest tender, or such other as may be in order.

Remittances should be made payable at par to the Department of the Naval Service at Ottawa. Bank cheques will not be accepted unless certified.

G. J. DESBARATS,
Deputy Minister of the Naval Service.
Department of the Naval Service,
Ottawa, August 28, 1916.
Unauthorized publication of this advertisement will not be paid for.

Refreshing Tea

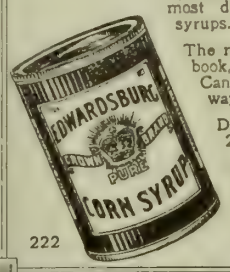
In any season — Summer or Winter — there is nothing more enjoyable than a delicious cup of tea. The flavor must be *"just right,"* though, and that's where KING COLE TEA excels.

"You'll like the flavor"

Let Him Help Himself To CROWN BRAND CORN SYRUP

IT will do more than satisfy his craving for "something sweet"—it will supply the food elements needed to build up his little body and help him to gain in health and strength.

"Crown Brand" is a wholesome, nourishing food—as well as the most delicious of table syrups.



The recipes in our new book, "Desserts and Candies", will tell you just how to use it, in many novel ways. Write for a copy to our Montreal Office.

Dealers everywhere have "Crown Brand" in 2, 5, 10 and 20 pound tins—and 3 pound glass jars.

Big Ben

For the Cream of the Day

TWO A. M.—inky dark—that's when Big Ben starts the milkman's day.

Out of bed like a boy going fishing—nudges Big Ben to a hush—takes up the tune as he whistles to work.

You've heard that patter of nimble feet—the clink of bottles in the wire tray—the rattle of boxes, of cans and ice—the giddap—the wheels—the merry tune—all unmindful of the world at sleep. You've wondered.

Try Big Ben *yourself* a little earlier. See how he'll bring you the cream of the day—rich morning hours that start you right and stretch out till night with minutes aplenty for every task. And you'll take up his tune and smile through the day.

Big Ben is six times factory tested. At your dealer's, $2.50 in the States, $3.00 in Canada. Sent prepaid on receipt of price if your dealer doesn't stock him.

Westclox folk build more than three million alarms a year—and build them well. All wheels are assembled by a special process—patented, of course. Result—accuracy, less friction, long life.

La Salle, Ill., U. S. A. Western Clock Co. Makers of *Westclox*

Other Westclox: Pocket Ben, Baby Ben, America, Bingo, Sleep-Meter, Lookout, Ironclad.

wild note in her voice. "See here—the paving stone is up. Look!" She took his hand where he knelt beside her. "There!"

Holding his hand, she thrust it down into an open space. "It goes down," she exclaimed. "Now I know. Don't stop me, Anthony."

"What," he cried, seizing her, "what are you going to do?"

"The passage is there," she answered, like a woman who is either mad or inspired. "Don't stop me—I'm going down to him."

"Margaret, Margaret," he cried, "you're out of your mind! For God's sake, tell me what you're going to do——"

She was pushing and scooping at the earth with her small hands; she took not the faintest notice of what he said.

"He got down there," she answered, "so I can."

Now Sir Anthony saw distinctly a bog hole in the ground, and a white paving stone standing upturned beside it where it opened. Lady Margaret lay down flat on the ground and began to crawl forward toward the opening in the earth. He tried to pull her back.

"Margaret," he cried, "you mustn't! You are mad! You want to go down—there—and leave me! It's hollow—it's a chasm—you'll be killed——"

"You can't stop me," she answered. "I know he's there, so I'm not frightened. I'm going to him."

To his horror, he saw the upper part of her body disappearing down the opening; gradually the rest of her body to the tips of her feet disappeared.

Sir Anthony threw himself down on the ground and tried to force his way down the aperture after her.

Then a sound reached him; he stopped short again; the shriek of a tortured thing. What happened, or how he did it—if the aperture had widened suddenly from his efforts—he did

DO YOU SUFFER FROM

Palpitation?

If there is no heart disease Dr. Cassell's Tablets will cure you.

Palpitation may be due either to weak disturbed nerves, and a debilitated system resulting from vital exhaustion, or to flatulence arising from dyspepsia. In either case the only rational treatment is to nourish your nerves and to strengthen your digestive organs. That you can always do by taking Dr Cassell's Tablets.

The proper course is to take Dr Cassell's Tablets twice daily, and Dr. Cassell's Instant Relief at night. The first brings new strength and vitality, the second restores digestion and clears away the harmful matter from which flatulent gases arise. Follow this course and palpitation will soon cease to trouble you. We make only one reservation. If you have actual heart disease (which is rare), you should see a specialist, all other forms of palpitation these Tablets will certainly cure. Here is an extract from a letter written some time ago by the late

Major-General Sir John W. Campbell, Bart., C.B.:—I have pleasure in stating that I have derived great benefit from Dr. Cassell's Tablets, and have found them remarkably effective in restoring nerve energy and physical vigour. I have every confidence in recommending them."

A. McCAUSLAND, Victoria Hotel, St. John, N. B., Maritime Representative.

not know, but when that shriek reached his ears Sir Anthony found himself halfway down the opening of the narrow passage. The ground sloped and slipped beneath his hands; it was wet; it crumbled downward under his body. Down, down he went, but from crawling flat he gradually found himself upon his knees, from his knees he rose to a half-sitting, half-standing posture. At length he stood almost upright, but with bent head, which he felt was touching a roof.

His one thought was to find Margaret, but whether living or dead he did not know. And now he knew, but could not see, that a long passage sloped before him, earth-paved, earth-walled. He felt it wind and turn; from somewhere—from the end of the passage, he thought—the faintest glimmer of light was falling. Blindly he made for the light, but it failed suddenly, and he found himself up against a dead wall. Then he turned back, seeking the light he had lost, and discovered with outstretched hand in the darkness that the passage dipped and swerved again to the left.

Again the little white glimmer of light—and a passage to left, a passage to right of him. He stopped short. There passed over him the sensation of nearness to Something which was aware of him. He stepped aside; he felt it coming on to him—on—— It had passed—passed over him like a breath! He knew that it had gone. Now he knew that he must turn to the right, that the light was coming from there. That something—something was waiting there for him. The light grew nearer, and with the approach of it the passage widened suddenly into a chamber at the end of it.

Then he saw where the light came from.

A little chapel opened before him, ablaze with the sheen of shells, with the dazzle of candlelight. His eye fell on Margaret. She was crouching against the purple mosaic of the chapel wall, and she pointed to an altar encrusted with the moonlight shimmer of oyster shells, covered with masses of Christmas roses and chrysanthemums, gleaming with the golden blaze of candles.

At the foot of the altar lay her lover, with his arms out thrown. The candles gleamed on the dead whiteness of his face.

Lady Margaret was still pointing.

"Look—look!" she whispered. "She has kissed him!"

ESTABLISHING AND MAINTAINING A FARM FLOCK OF SHEEP

(Continued from page 751)

ence to the essentials, or at least keep it in proper proportion.

As he gains in knowledge and experience his ideal may change. Market conditions may require it. He must not forget that the pay for his work depends upon the market, and the demand for his rams as breeders will be largely determined by the more profitable lambs they can produce in the average flock. Whether early maturity, easier fleshing qualities, longer staple, heavier fleeces, or some other distinctive trait be emphasized and developed to a greater extent must depend upon the market which the men who buy his rams must supply. Time was when all the sheep raisers in this country wanted a heavier fleece, because the high price of wool made the heavy shearer the most profitable. At another time the most money was made on a fat lamb, and the wool was a small factor in the equation. While one cannot change with every passing swing of the market pendulum, yet he must consider the various conditions under which he must grow his sheep, the number of men similarly situated, and the prospects for a broad, steady, and continuous market for the wool and mutton from the flocks to which he expects to supply rams.

As he studies the development of the industry in a broad, general way, as he watches the tendencies of the markets and foresees their course, as he governs his breeding operations in conformity with his knowledge and experience and succeeds in supplying a demand which is broad and remunerative, so may he expect to be rewarded. While he will probably receive financial returns amply justifying him in his work of establishing and building a flock which may ultimately be known beyond the confines of his own immediate locality, yet his greatest compensation for the money and time and labor expended must be the personal satisfaction that he has done something worth while.

The development and improvement of one pure-bred flock and its successful maintenance for any length of time inevitably raises the standard of the sheep industry in that community, and its effect extends in proportion to the importance and value of its work. While working for himself the shepherd has labored for his neighbor and for those who come after him. When the time comes for him to leave his earthly possessions it can well be said that he has left the world better for his having lived. What greater tribute can man desire?

Back Your Aim
with Confidence
in Dominion—the only Canadian-made ammunition.
When the one good shot of the trip arrives you will never know the disappointment of a missfire if you use
Dominion Big Game Cartridges
At that instant when the moose or deer appears the knowledge that a true aim is backed up by true ammuninion helps mightily.

The Car with the Half Million Dollar Motor
MADE IN CANADA
Eight-38 $1185
Four-38 $975
BRISCOE
Four
24
$825
The Half Million Dollar Motor at Toronto Exhibition
The latest Briscoe beauty has taken Canada by storm. At the Toronto Exhibition, the crowds who thronged the Automobile Section were enthusiastic in their praise of Benjamin Briscoe's masterpiece—the Briscoe 4-24—the car with the Half Million Dollar Motor.
It is the Car that all Canada has been waiting for—a beautiful car—a luxuriously comfortable car—a powerful car—at a price that is within easy reach of the man of every-day income.
Such a car for $825 is possible because of Mr. Briscoe's success in perfecting the Half Million Dollar Motor—the longest long-stroke Motor in the world.....3⅛" bore to 5⅛" stroke—a motor that made 32 miles on a gallon of gasoline.
The 105-inch Wheel Base, Floating Type Rear Axle, Full Elliptic Springs and deep Upholstery insure the utmost ease and comfort, when motoring.
Built on beautiful lines, with 5 passenger Touring or 4 passenger Roadster bodies. Splitdorf electric Starting and Lighting, fully equipped throughout.
You are interested, of course. You want complete details? Well, send for a copy of Mr. Briscoe's own story of "The Half Million Dollar Motor". It's a big man's narrative of a big achievement. A fascinating pen picture of pluck, virility and romance—of old-world pathos and new-world success. Mailed free. Write to-day for it.

ALLIED VICTORIES REACT ON BELGIUM

Brussels.—The gradual tautening of the Allied cordons around the German lines on the western battle front is making the desperation of the Teutonic forces felt in more ways than one. While internal conditions are assuming serious proportions in Germany the situation in Brussels and other Belgian centres under German control is even worse.

It is worse because the German occupants are bleeding the helpless Belgian people in order to exact every possible benefit for themselves. Regard for humane methods, which was lax enough before, has now been cast to the four winds, and pressure is brought to bear on men, woman, and children—the aged, decrepit, the weak, and the strong to further the German cause.

The conditions resulting from this can hardly be imagined. Where bitter hunger and want existed before, starvation is now all that confronts the people. Millions who are anxious to help themselves and the Allies can do neither. They are powerless against this oppression, and their suffering is such as has never been known before in recent civilization.

The imposing of a fine of five million marks on Brussels recently because of the observance of the anniversary of Belgian freedom is but another instance of the weak excuses of the invaders to extract what is possible from the blighted country and her heroic people. The money means little perhaps to Belgium if it were money alone, but when money is not forthcoming the equivalent is taken. Food above all is the one thing most wanted, and is the one thing, unfortunately for Gelgium, most wanted by the Germans. Local products are seized without regard for the pitiful wails of little children and the frantic cries of their parents, who see their sole sustenance being taken from them.

There is but one source of relief for these people—that afforded by the Belgian Relief Commission. Were it not for this organization Belgium would have long ago succumbed to the attacks of robbery, rapine, and destruction made by the Germans. They cannot, and dare not, touch this source of relief, and on it alone Belgium depends for her existence, scant as it is.

Word has been received here from the offices of the Belgian Relief Commission, 59 St. Peter Street, Montreal, that renewed efforts are to be made to send assistance. Canada's harvest this year is report to be a record-breaker, and of it the Dominion will give the one thing most needed, wheat. Money is being raised all over Canada to be spent in Canada to buy this wheat, so while the committee is saving millions from death by starvation it is at the same time spending all its money within the Dominion—a plan which works beneficially both ways.

The administration of Belgian Relief has been reduced to such a point that $2.50 will now keep a Belgian family a month, in spite of high prices obtaining elsewhere in the war zone. An effort is being made to get Canadians to agree to keep one family by giving this amount in regular monthly installments.

The Belgian Relief Committee, 59 St. Peter Street, Montreal, a central organization which operates with no expenses, is now receiving these donations from those Canadians who are willing to assist this humane and patriotic work. Subscriptions should be sent through local committee or district.

DEMAND MAY EXCEED OUTPUT

At no time in the history of the motor car business has the demand for motor cars been so phenomenal as during the present year. Manufacturers have had tremendous difficulties in getting out sufficient cars to take care of this demand, and many factories have been running night and day to keep pace with this demand.

For the greater part of this year the big plant of the Ford Motor Company of Canada, Limited, at Ford, Ontario, has been working twenty hours a day to keep its production equal to the demand. Ford cars to the number of 32,646 were shipped from the factory from August 1, 1915, to July 31, 1916, inclusive; and over two-thirds of this number are now in use in Canada, while the balance were shipped overseas, British possessions—Australia, New Zealand, Africa, and India—getting the bulk of the overseas shipments.

For the 1917 season it is planned to manufacture over 50,000 Ford cars, and new equipment is being installed and additions to the plant are under way now to handle this enormous output.

Many other motor car manufacturers have during the year advanced their prices; but, in keeping with their policy of giving the public the advantage of every economy of production, the Ford Motor Company made a material reduction in prices.

These reduced prices, which went into effect on August 1st, will undoubtedly stimulate the demand for Fords. When a real motor car can be purchased for less than five hundred dollars it begins to look as though walking was a needless waste of time and energy. Truly the Ford is the car of the multitude, and it is doubtful whether the Ford Motor Company will be able to turn out enough cars this year to satisfy al lthe would-be purchasers.

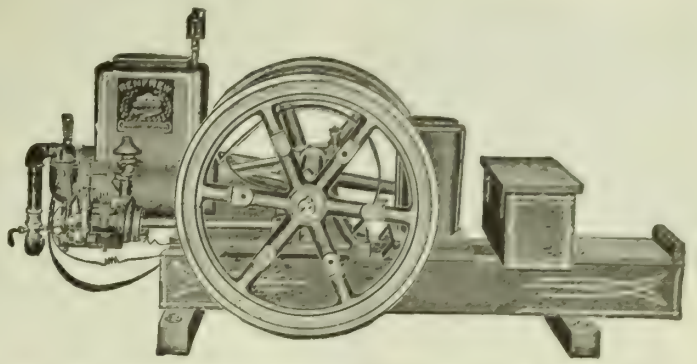
PRESERVATIVE TREATMENT OF FENCE POSTS

The supply of durable woods for fence posts is rapidly decreasing, necessitating the use of other woods that are less suitable. Fortunately western Canada has a fairly abundant supply of such woods as jack pine, spruce, willow, and poplar, which can be used for the purpose. The economical use of these woods, however, demands that some preservative be used to prevent the rapid decay of the portion of the post which is underground. The cost of treating entails some expense, but the outlay is small compared with the cost of new posts and the additional labor of installing them. Woods of the class mentioned above decay in a very short time if placed in the ground untreated, especially if they have not

Renfrew Standard

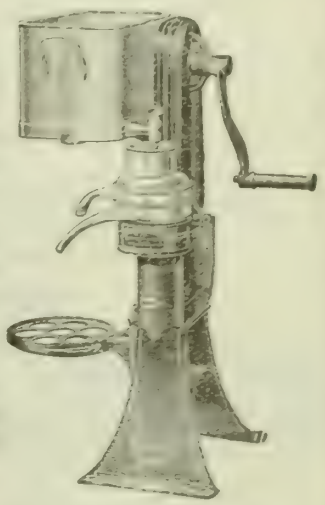
Guaranteed Quality

The Renfrew Standard gasoline engine is fully guaranteed by us. You run no chance in buying anything that we stand behind. We know that the quality of every piece of material in this engine is the very best, and you will find that the engine is built to meet Canadian conditions. It has dual ignition, steam engine type governor, very economical carburetor and other high grade features. Get our engine catalog.



We also have a full line of ensilage cutters, grain grinders, saw frames, etc.

The Standard Cream Separator is built right here in Canada at our big, modern factory in Renfrew, Ontario. If you should happen to need a new part at any time you can get one quickly. No customs hold ups or other delays to keep you waiting.



This "Made in Canada" machine is unsurpassed for close skimming. See the Government Dairy School reports. That's all we ask.

It is also self-oiling, easily turned, rapidly cleaned, and built to last. Get our separator catalog and read all about it.

The Renfrew Truck Scale

should be on every farm to weigh anything from one pound to two thousand. Government inspected for accuracy. Self adjusting —you can weigh on uneven ground. Wheels around like a truck. Strongly built. Guaranteed. Write for scale booklet.

been properly seasoned and set with the bark still on.

The posts should be cut, if possible, as soon as the buds begin to swell in the spring, as the bark can most easily be removed at that time. Posts should be carefully peeled and special care taken to remove the inner bark, as this, if left, prevents the absorption of the preservative. The posts should then be piled so as to allow a free circulation of air. A good plan is to place them in alternate tiers of three and seven posts with about fifty in a pile, with the piles located about ten feet apart. Posts handled in this way will be ready for treatment in the fall.

The object of the treatment is to prevent the growth of fungi or the action of insects which would otherwise cause decay. Creosote or some similar preparation of a coal-tar nature makes the best preservative. It is a heavy oil, insoluble in water, and acts as a chemical poison to fungi or insects. The advantage in using an insoluble mixture lies in the fact that when it comes in contact with moisture it does not dissolve and leach out. Creosote is a by-product in the manufacture of coal oil, and can be secured at most points.

The simplest and least expensive method is to apply the creosote with a brush, but such is not entirely satisfactory, as the oil does not penetrate far enough into the post. Three coats of boiling oil should be applied at intervals to the butts of the posts, so that each coat will dry before another is put on. After treating, stand the posts end up, so that any surface oil will run down the posts.

A more satisfactory method is to put the posts in a barrel and pour in creosote until the oil fills the top pipe. Then light a fire under the bottom pipe and keep it going until no more bubbles are seen to rise to the surface oil. Do not allow the temperature of the creosote to rise above 220 degrees, or the loss from evaporation will be too great. After heating, allow the posts to stand in the mixture for two to four hours, so that the oil will penertate, or the posts can be removed from the heated oil and immersed in a tank of cold oil. This latter plan is desirable for such woods as poplar, willow, or maple, which require treatment to preserve the tops.

If a large number of posts are to be treated a larger tank can be made of galvanized iron and the fire put directly under it

RESULTS OF THE GREAT UMC CARTDRIGE "DRIVE" AGAINST THE GOPHER

Windsor, Ont., Aug. 14.—The results of the Grand Remington UMC Gopher Shooting Contest, inaugurated in the Prairie Provinces in May last and continuing until July 10th, with the cooperation of the hardware dealers, are now announced. Among the hundreds of contestants the name of Mr. Colon Le Page shines out as the supreme winner and no little benefactor to his country. Mr. Le Page shot 2,879 gophers with Remington UMC .22 ammunition, and this is a remarkable score considering the short term of the contest. Mr. Le Page not only captures the first prize offered in the local contest held under the auspieces of Mr. George McIntosh, hardware dealer, of Vonda, Sask., but he also wins the Grand Western Champion Shot Prize of a 12-Gauge Pump Gun donated by the Remington Arm Metallic Cartridge Company, of Windsor, Ontario.

The second largest score of the contest is announced to be Mr. J. R. Moon, of Didsbury, Alta., with a score of 2,805 dead gophers; and the third largest winner was Mr. Harold Brackette, of Medicine Hat, Alta., with a score of 2,087.

In all, it is believed that over 300,000 gophers met their doom in this grand "drive," and the hardware dealers and young people o fthe west who took part in the contest are to be congratulated on this notable decrease in the numbers of their country's most insidious enemy.

Barrett *Made in Canada*

Money Savers for Farmers

IF you want steady, sure profits, watch the little leaks in your purse. A stitch in time saves nine. Many a sturdy fence has to come down for want of preservative at the right time. Many a house has to be replastered because that little leak in the roof grew big. Many an order goes to manufacturers of farm implements because the older implements weren't painted. And so it goes. A little expenditure here, a little one there, until you are surprised at the sum on the debit side of your ledger.

Now look at the articles in this advertisement. Then ask yourself if you haven't lost money in the past for lack of just such things. We are appealing to the common every-day horse sense of the Canadian Farmer. And he's famous for just that quality.

Carbonol—When a product gives you the best possible aid in a hundred different ways, can you afford to be without it? Carbonol does this. It is a disinfectant of the highest grade. When you clean house, add Carbonol to the water. It removes grease marks, kills germs and banishes odors. If you cut yourself, you can heal the wound and prevent blood poisoning by using Carbonol. And sores that injure horses or cattle are easily cured with it. If the garbage pail draws flies, sprinkle it with Carbonol. It is the best thing you could use in the sick room to prevent contagion. There isn't anything like Carbonol for farm and home use. Get some today.

Everlastic Roofing—In Everlastic Roofing we offer a thoroughly reliable "rubber roofing" at very low cost. It is easily laid without skilled labor and is famous for its wearing qualities. Wherever you have steep roofs, use Everlastic and do away with leaks. Water, wind and weather are defied by this roofing. The best value you ever saw.

Elastigum—Little repairs can easily run into money unless you have something like Elastigum on hand. A tough, adhesive, elastic and waterproof cement that will save you money and worry in a hundred different places. To reline or join gutters, use Elastigum. To seal leaks of any kind, use Elastigum. To stuff cornices or renew chimney flashings, use Elastigum. You will find it makes repairs not only cheap but easy and permanent.

Barrett's Grade One Liquid **Creosote Oil** — Grade-One Creosote Oil is the most effective wood preservative on the market because it penetrates more deeply than any other. And it's practical for you because you can apply it by the dipping or brushing method instead of the difficult and expensive closed-cylinder method. Grade-One Creosote Oil will make an ordinarily good fence post last 20 years. Use it on all your exposed woodwork. It makes exposed surfaces rot-proof and moisture-proof.

Amatite Roofing—Amatite Roofing is distinctive for two reasons—its bright, attractive, sparkling appearance and its great durability. It has wide fame, too, as the roofing that needs no painting. Its mineral surface is waterproof and fire-resisting. Amatite is made in rolls, each roll containing enough to cover 100 square feet with a 3 inch lap.

Everjet—Black as Egypt and much more useful to you—that's Everjet Elastic Paint. This glossy, permanent, elastic paint is a triumph. Indispensable as a roof paint and covering for exposed surfaces. Make your roofs permanently weather-proof and waterproof with Everjet. It's a wonder. It clings to metal surfaces regardless of temperature. It never peels or chips. Positively insures against rust.

Creonoid—The first step toward having healthy, profitable live stock is to keep them free of vermin, lice or flies. Creonoid, Lice Destroyer and Cow Spray, will do this better and more surely than any other animal antiseptic. Just spray your cattle lightly with Creonoid and watch the difference. No flies or mites will bother them. Put some in the cracks and corners of the hennery woodwork. No more mites to make nervous, poor laying hens. Try it in the piggery.

Sold by good dealers everywhere. Send for new "Money Saver" Booklet.

NO ROYAL ROAD

We are told that there is "no Royal Road to Success," and most of us have at some time or another proved it be true. We have found that it is only by steady, persistent effort that anything worth while is attained. Yet if the above is a truth it is also a fact that success does come to those who earnestly strive for it along the right lines. A case in point is that of "King Cole Tea," whose advertisement is seen from time to time in our pages. Starting some six years ago in the face of the sternest competition and adverse market conditions, this tea, by makin "quality first" its watchword,

Build to last

BEFORE you build or repair your barn or house, let us show you **how much money we can save you.** Here are the "Metallic" fireproof, stormproof and timeproof specialties.

"Eastlake" Galvanized Shingles.
"Empire" Corrugated Iron.

Address
Metallic Roofing Co. Limited
MANUFACTURERS
Toronto Winnipeg

167

"Metallic"

has made solid progress from year to year, until today. it stands recognized by grocers and the public generally as one of the very highest class brands of tea in Canada.

It is four years since the G. E. Barbour Company, the blenders and packers of "King Cole," commenced to issue with each package the now well known guarantee of "Money back if not satisfactory." This was done to convince the public of the genuineness of the character of King Cole Tea and to provide redress for any possible disappointment. The fact that not a single paskage has been returned in that time leaves no doubt in one's mind as to the high quality of "King Cole" and the careful way in which that quality is maintained.

The company gladly pays tribute to the newspapers as a medium for making the merits of their tea known to the public, and we are glad to feel that we have in a measure contributed to "King Cole's" success.

The slogan of King Cole Tea is: "You'll like the flavor."

SOOT FOR SCOURS

For the benefit of those who have trouble with white scours in calves, I will give a treatment which we have used in a number of serious cases of white scours with excellent results:

Give the calf about six tablespoonfuls of castor oil. From eight to ten hours after giving the oil, remove a length of stovepipe from the stove and take some of the dry, crusty soot from the inside of the pipe and give the calf two heaping tablespoonfuls of it. Each spoonful of soot should be placed well back on the tongue and followed with a little milk or water to aid in swallowing it.

The scours will generally disappear inside of 24 hours. I wish some one would try this treatment and let me know what results they have.—A. S., in Agriculturist.

GOOD ROADS DAY AT THE HALIFAX EXHIBITION

"Good roads for Nova Scotia!" will be the slogan on Friday, September 15th, at the Provincial Exhibition at Halifax. Every one interested in this important matter is urged to make it a point to be in the city on that particular day.

A business meeting will be held in the Board of Trade rooms at 10 o'clock in the morning for the purpose of effecting the organization of a Provincial Good Roads Association.

Moving pictures on the subject will be shown at the exhibition in the afternoon and it is probable that something of interest will be arranged for the evening.

Remember the day—Friday, September 15th.

SOLDERING IRONS

For general purposes a 1¼-pound soldering iron will be found satisfactory. Where continuous work is to be performed two irons are necessary in order that one may be heating while the other is in use. Soldering irons should be heated only in a clear charcoal fire or in a blue flame of gas, gasoline, or alcohol. Before using a soldering iron it is essential that the tapering copper point be filed or ground until bright, and then coated with solder by first dipping the brightened hot point into a little of the soldering acid and afterward rubbing over the solder. This process is known as "tinning" the iron, and is necessary in order to make the solder adhere to the copper and spread evenly. The iron must be re-tinned as often as the coating burns off. Soldering irons are sold by the pound, the price depending upon the market price of copper.

WASTE OF WEEDS

According to the United States Department of Agriculture, the annual waste due to weeds is estimated at $300,000,000 for the whole United States. In certain states where diversified farming is the exception and not the rule, the waste is said to approximate $40,000,000 per year. What the waste is in Colorado cannot be accurately estimated, but it is undoubtedly true that considerable waste occurs. In the intensively cultivated sections the waste is not very large because of the clean culture needed for certain crops. In sections where grain crops are very popular the waste is quite large.

The principal ways in which weeds affect farming are through direct damage to the crop, cutting down the yield, cheapening the product, and lowering the value of land.

SUBSTITUTE FOR PIPE WRENCH

It frequently happens that a pipe wrench is needed to turn a pipe and none is handy A fair substitute is to break off a short piece of an old file and use it on the jaw of a flat wrench. The file will grip the pipe, preventing the wrench from slipping. Of course, this is not equal to a good pipe wrench, but may serve to tighten or loosen a pipe or bolt when nothing else at hand will serve to do the trick.

TRAPPERS! Send your RAW FURS to JOHN HALLAM

and receive highest cash prices. We send money the same day the furs are received. Charge no commissions—and pay all charges. We have paid out millions of dollars to thousands of trappers in Canada who send their furs to us because they know they get a square deal, and receive more money for their furs. You will also. We buy more furs from trappers for cash than any other five firms in Canada.

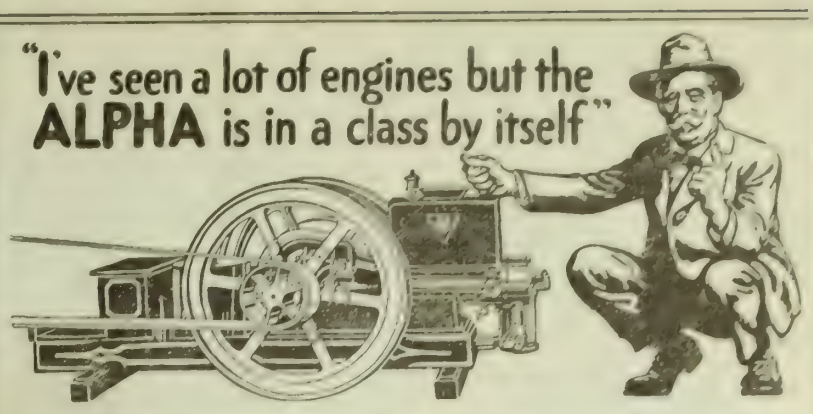
"I've seen a lot of engines but the ALPHA is in a class by itself"



THE more a man knows about gas engines the stronger is his recommendation of the Alpha. Users of the Alpha who have had lots of engine experience will tell you that the Alpha gives them the most power for the fuel consumed, is the least troublesome to keep in good working order, costs the least for repairs, and that they can always rely on it to give them plenty of steady power when needed.

The fact that the Alpha is not affected by cold weather is one of its good points that is especially appreciated by Canadian users. The speed and fuel consumption of the Alpha are accurately regulated to all loads by the quickest acting and most sensitive governor ever used on a gas engine. There is no waste of fuel and the engine runs steadily under all loads—light, heavy or varying.

The Alpha has no troublesome batteries. It starts and operates on a simple low speed magneto. The entire ignition system is remarkably simple and assures you of a hot, fat spark at all times. You can use either gasoline or kerosene for fuel.

The strong recommendation the Alpha gets from its users is the result of features that you can readily appreciate when you see the engine or the illustrations and descriptions in our large catalogue. Send for a copy of this catalogue at once. Read it carefully and you will agree with Alpha users that this engine is in a class by itself, and gives you the most for your money.

Alpha Engines are made in eleven sizes—2 to 28 H.P. Each furnished in stationary, semi-portable, or portable style, with hopper or tank cooled cylinder.

MONTREAL PETERBORO WINNIPEG VANCOUVER

True co-operation is not a get-rich-quick scheme. It is plain common sense and means doing business in the simplest, safest and most economical way. Its success is due to the practical application of modern business principles that will insure the success of any undertaking—whether it be a billion dollar trust or a cooperative grocery store.—The Cooperator.

It is estimated that egg production alone in Canada for 1915 was $30,000,000. This is two and a half times the value of the whole fruit crop of Canada, six times the value of all the sheep, and half the value of all the cattle produced.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and [illegible]
If you, my sister, are [illegible] ill-health, and feel unfit for household duties social pleasures, or daily [illegible] just how you suffer and [illegible] trial of a **home tre tment** suited to your needs; with references to Canadian ladies who gladly tell how they have [illegible] happiness by its use. [illegible] this successful method of home treatment for yourself, my reader, [illegible] or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand a woman's sufferings; what we women know **from experience,** we know better than any doctor; and thousands have proved there is hope **for the hopeless** in my method. If you suffer from **pain in the head, back, bowels, feeling of weight** and dragging down sensations, **falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid,** to prove to yourself that these ailments [illegible] home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured,** my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—**young or old.** To **Mothers** of **Daughters,** I will explain a simple home treatment which speedily and effectually cures [illegible] (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by **return mail.** To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask** for the **free treatment to-day,** as you may not see this offer again. One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

Volume 21. SUSSEX, NEW BRUNSWICK, SEPTEMBER 26, 1916. Number 24.

THE HALIFAX EXHIBITION

The big Nova Scotia Provincial Exhibition opened its doors to the public on Wednesday, September 13th, and from then until they were finally closed on Thursday, September 21st, the weather man was most kind. An abundance of sunny, balmy weather of just the right temperature to make everybody get out to see everybody else and everything was responsible for the large attendance. The fair had been well advertised by the management; they promised the public a show bigger and better than ever, and in this the public was not deceived.

Visitors who had on previous occasions visited the fair could not fail to notice the changes for the better in many of the departments. The fisheries exhibit, which was very small, and the showing in the horse classes, which in point of numbers was not nearly up to that of last year's exhibition, were considered by all who are conversant with the previous Halifax fairs to have been the weak spots this year.

Hon. E. H. Armstrong, the President of the Exhibition Commission; M. McF. Hall, the Secretary, and the other gentlemen who compose the commission as well as the superintendents and their assistants in the various departments were untiring in their efforts to make matters run as smoothly as possible for the exhibitors and the throngs of visitors.

Despite the fact that the midway was more extensive than ever and ample opportunity afforded for all who felt inclined to enjoy themselves along the lighter lines, an increased interest in the educational features of the fair was very noticeable. It was most gratifying to the superintendents of the cattle, sheep, swine, horse, poultry, fruit, flowers, agricultural products, dairy, women's institutes, mines, women's work, arts, and manufactories to note the throngs of visitors who came to their respective departments not merely to pass through, but who lingered long to examine minutely each and every exhibit. Never have we seen such interest evidenced in the live-stock departments as we noticed this year. While the various classes were being judged interested persons watched the placings, and as we moved around among the various groups we heard many interesting discussions on the types represented in the various sections of each class.

THE MAIN BUILDING

was well filled with the exhibits of manufacturers and dealers in a wide range of articles. Exhibits from the public schools, Rural Science Schools, the Nova Scotia Technical College, and models of good roads shown by the Department of Public Works of Nova Scotia occupied the gallery, while the annex was filled to overflowing with automobile exhibits.

THE FINE ARTS AND WOMEN'S BUILDING

contained some very handsome and valuable paintings, drawings, and beautiful specimens of work in women's handicrafts, all of which were admired by thousands of sight-seers.

THE MINES BUILDING

better than ever before represented the mineral wealth of Nova Scotia. It contained exhibits from the various coal mines, the Dominion Iron and Steel, the Nova Scotia Steel and Coal Company and a wide range of the iron and other economic ores so abundantly found in the province.

One of the most interesting features displayed in the Mines Building was the display of war munitions in their respective stages of manufacture.

THE WOMEN'S INSTITUTE DEPARTMENT

had a splendid display in the former Fishery Building, and received a great deal of attention from the general public. Miss Jennnie Fraser the popular and energetic supervisor of Women's Institutes for the province, was in charge, and with her as a booster for the work was Miss Agnes McGuire, of Lunenburg. The display of home-made mats, carpets, spreads, quilts, tablecloths, towels, etc., which were nearly all made by the industrious women of Lunenburg County was an eye-opener to many in whose home districts this line of home craft is practically a lost art.

Both Miss Fraser and Miss McGuire are deeply impressed with the possibilities for the development of industries of this kind in the home, and both are of the opinion that on the ability of the farmer's wife and children to use their spare time in the manufacture of articles that bring a ready sale at fairly remunerative figures for time and material hinges, to a great extent, the success of the back-to-the-land movement.

The various implements used in the home manufacture of woolen and linen goods from the sheep's wool and from flax were shown and in operation during the fair. The spinning wheel, the distaff, the loom, and other implements recalled to many minds the scenes of their childhood, when grandmother, mother, wife, or sister plied these arts.

The Women's Institute Department also contained a display of canned fruits and vegetables, and bulletins on how this line of work may be performed in the farm home were there for the asking.

The Horticultural Department of the Nova Scotia College of Agriculture showed a nice display of garden vegetables that should be grown in each and every kitchen garden in Nova Scotia, and while the aims of the Women's Institute—"Patriotic Work," "Home Work," "Red Cross Work," "Charitable Work," "Community Work," and "School Work"—were depicted on the artistic arches surmounting the display, attractive placards posted in conspicuous places throughout the building drew the attention of the public to the following salient facts:

"Work is our reward, our strength, our glory, and our pleasure."

"Do you eat enough vegetables? Do you realize how important they are in the nourishment of the body? If you did, you would grow more and be more healthy."

"Patriotism and Production—Grow vegetables, eat vegetables, practice economy."

"How much nourishment are you wasting when cooking vegetables? Find out the proper method by consulting the bulletin issued by this department."

"Would you like fresh vegetables during winter? Try canning them through the summer and autumn."

"Grow and eat more vegetables."

"On a conservative estimate $200,000 is spent every year in Nova Scotia for canned vegetables. This money goes out of the country. Can your own, and save money."

"The vegetable campaign means Health, Economy, and Industry."

"Are you growing vegetables? If not, try them in that bit of land, and see what you can do. If you desire information consult Prof. Shaw, of the N. S. A. C., Truro."

THE CREAMERY INDUSTRY

was well represented in the former Fishery Building. W. A. MacKay, superintendent of dairying for Nova Scotia, and M. Harvey Mitchell, of the Cow Testing Association Division, had the best instructive display of dairy utensils ever shown at Halifax. There was a neat creamery, where butter making was demonstrated at certain hours, and where the product—butter and buttermilk—was sold to the public. There were up-to-the-minute churns, butter workers, pasteurizers, Babcock testers, acidimeters, butter scales, hydraulic butter printers, refrigerators, rotary pumps, starter cans, bottle washing machines, lactometers, moisture testers, equipment for keeping records, model cream can houses, and other implements of interest to the creamery men and dairymen.

The butter buyers' challenge trophy, which is for annual competition at the Convention of the Dairymen's Association of Nova Scotia, was on exhibition, and much admired. The Brookfield Creamery Co. captured this trophy in 1916.

The progress of the dairy industry in Nova Scotia from 1907 to 1916, which is attributed to co-operation, the creamery, and the cow-testing associations, was well illustrated by a chart containing the following information:

Progress of Creameries in Nova Scotia

Year.	No. of Creameries in Operation.	Pounds of Butter Made.	Value of Butter Made.	% of Increase Over 1907.
1907	7	163,184	$40,896.00	
1908	7	163,147	40,886.00	*
1909	6	183,248	45,812.00	12
1910	10	256,420	76,669.20	63
1911	10	320,763	83,398.38	103
1912	11	470,603	130,076.17	218
1913	14	709,012	194,802.46	376
1914	17	913,273	257,600.00	529
1915	20	1,224,483	366,011.24	797
1916‡ ...	21	1,612,627	475,814.61	1066

* Decrease.
‡ Estimate September 1st.

Photos of the various creameries in Nova Scotia, with a record of the 1915 output, were shown. A cut of these clean-looking creameries will appear in the next issue of **The Maritime Farmer.**

A conspicuous placard asked the creamery man the question: "Are you in line for finest quality butter? Have you started cream grading? If not, why not?" And the creamery patron interested in cream grading was invited to walk into the office and talk it over.

Farmers who keep cows found much to interest them in the records of the following Maritime cows that show a satisfactory margin of profit. These records were shown on placards, and quite in contrast with the production of the average Nova Scotia cow:

Miss La Honda, owned by S. Dickie & Son, Central Onslow, world's champion, in three days' public test with 288.9 lbs. milk and 13.12 lbs. butter.

Hillside Sally, 3 years old, owned by Prescott Blanchard, Truro, 11,000 lbs. milk, testing 3.9 per cent butter fat.

Ardyne Perfection, 11,000 lbs. milk, testing 3.9. Owned by Prescott Blanchard.

Grange Sally, 15,000 lbs. milk, 4.2 per cent butter fat. Owned by Prescott Blanchard.

East Court Merry Maid, with first calf, 8,127 lbs. milk, 421 lbs. butter. Owned by the Nova Scotia Agricultural College.

Flora Rooker Rosch, with first calf, 15,599 lbs. milk. Owned by the Nova Scotia Agricultural College.

Emma of Evergreen 2nd, 16,737.6 lbs. milk, 654.03 lbs. butter. Owned by the N. S. A. C.

Artis Rosie, 16,318.6 lbs. milk, 751.25 lbs. butter. Owned by the N. S. A. C.

Victoria Calamity Clay, 22,835 lbs. milk, 803.41 lbs. butter. Owned by the N. S. A. C.

Jemima Wayne Sarcastic, 14,336.4 lbs. milk, 560.4 lbs. butter. Owned by the N. S. A. C.

Records of this kind may be produced in many Nova Scotia herds if

proper attention is given to feeding, breeding, and weeding. The best guide for the weeding process is to follow the work outlined by the cow-testing associations.

THE BUTTER AND CHEESE

There was a creditable display of dairy products in the cold-storage room adjoining the creamery exhibit. The awards and scores were as follows:

Butter, best tub, box, or firkin, not less than 50 lbs., suitable for export, made at any creamery.

1. Jos. Dansereau, St. Hyacinthe, Que. Score 97.
2. J. R. Sweeney, Margaree Forks, N. S. Score 95.
3. Milburn Creamery Co., Malignant Co., N. S. Score 94.
4. C. M. Johnson, Bedeque, P. E. I. Score 93.5.
5. D. E. McLeod, Sterling's Brook, N. S. Score 93.

Best box, not less than 28 lbs., suitable for export, made at any creamery.

1. C. L. Le Blanc, Meteghan River, N. S. Score 96.
2. J. R. Sweeney. Score 95.
3. Milburn Creamery Co. Score 94.
4. C. M. Johnson. Score 93.5.

Butter, best prints or fancy packages, not less than 50 lbs., made at any creamery.

1. J. R. Sweeney. Score 95.
2. C. M. Johnson. Score 93.5.
3. Scotsburn Creamery, Scotsburn, N. S. Score 92.5.
4. F. E. Porter, Dayton, N. S. Score 92.25.

Butter in granular form, from 3 to 5 lbs. in glass jar, made at any creamery or farm dairy.

1. W. Arthur Tuttle, Pugwash, N. S.
2. F. E. Porter.
3. Mrs. Barrie Fulton, Stewiache.
4. A. Cameron, Loch Katrine, N. S.

Butter, best basket or package of prints, not less than 10 lbs., made at any dairy farm.

1. W. Arthur Tuttle. Score 93.5.
2. F. W. Foster, Kingston, N. S. Score 93.
3. Mrs. Isaac Hoar, Onslow, N. S. Score 92.
4. H. L. Neily, Kingston. Score 91.

Best crock, box, or tub, not less than 20 lbs., made at any dairy farm.

1. W. Arthur Tuttle. 93.5.
2. F. W. Foster. 93.
3. McFarlane Bros. 92.5.
4. Mrs. I. Hoar. 90.5.

Cheese, best 2 packages colored, not less than 50 lbs. each, made at any factory before the 1st of September, 1916.

1. J. A. McManus, Cornwall, P. E. I. 95.
2. Leo Hughes, Emerald, P. E. I. 74.75.
3. Jos. B. McDonald, Arlington, P. E. I. 94.5.
4. J. H. McDonald, Vernon, P. E. I. 94.

THE AGRICULTURAL HALL

held a good display of field and garden vegetables and grain. The prize winners in the seed grain section were as follows:

Field Grains, Seeds, etc.

Wheat, White Winter, A. U.
1. Thos. Aylivard, Falmouth, N. S.
2. William O'Brine & Sons, Windsor, N. S.

Wheat, Red Winter, A. V.
1. William O'Brien & Sons.
2. Thos. Aylward.

Wheat, White Spring, A. V.
1. Bertrand Goodspeed, Peniac, N. B.

Wheat, Red Spring, A. V.
1. McFarlane Bros., Fox Harbour Point, P. E. I.
2. M. B. Harrison, Athol, N. S.
3. Newton Kuhn, Dartmouth, N. S.

2. Allen Bezanson.
3. Newton Kuhn.

Victor Aylward, W. J. Aylward, and Harry Loomer showed the best collections of ensilage corn in their respective order.

Allen Bezanson, B. F. Chesley, and Robert Settle, Sr., had the best collections respectively of field corn.

In garden vegetables, B. F. Chesley, Allen Bezanson, and Harry Loomer showed the best collection.

The Dominion Department of Agriculture had two splendid displays in the Agricultural Hall. One of these was that of the Experimental Farm at Nappan and Horticultural Station at Kentville. Specimens of grains, grasses, fruits, and vegetables were tastily arranged.

Models of barns, sheep houses, feeding racks and troughs, wool packing boxes, dipping tanks, and other instructive labor-saving devices were on exhibition, and we would judge that many of our boys will put in a part of their spare time during the coming winter in putting some of the ideas shown therein into practical use.

Mr. W. W. Baird, Superintendent of the Nappan Farm, was in charge, and was kept busy showing and explaining the various models. He also had some splendid photos of the respective breeds of sheep.

The following placards were closely studied by the visitors:

"Lime produces conditions suitable for the clover plant."

"Clover makes the soil more favorable for vigorous crop growth. We will be pleased to send you publications."

"Four thorough sprayings at the right time—two before blossoms and two after—ensure clean apples."

"Clover enriches the soil and produces suitable soil conditions for plants."

"Shallow, frequent cultivation after the cultivated crops are established conserve moisture and give larger crops."

"Proper rotation of crops will ensure the most profitable results."

"Black peat soil well dried is one of the best absorbents to use in the stable."

"Dispose of all non-producers."

"Absorbents conserve the liquid which contain most of the potash voided by animals."

"Sheep for cleaning roads, eradicating weeds, and consuming cheap fodder mean profit for you."

"Flushing the ewes well on the extra good pastures before the breeding season will mean more and stronger lambs next year."

"Market only the finished lambs. Thin, light, and late lambs can be profitably finished on the farm for Christmas and Easter markets, making from $1.00 to $2.00 greater profit per lamb."

"The three essentials to secure success in live stock are Breeding, Weeding, and Feeding."

Two photos in the centre of the display attracted the attention of many farmers who are confronted with the scarcity of help problem, as well as of those who wish to cut down the cost of production. One showed a farmer plowing with a two-horse team and a single furrow plow—cost of plowing one acre $2.00.

The other photo showed a farmer plowing with a three-horse hitch and a two furrow plow—cost of plowing an acre $1.25.

The foregoing and other farming problems were discussed by Mr. Baird.

THE WOOL EXHIBIT

The other exhibit referred to above was the wool exhibit of the Live Stock Branch, in charge of Mr. McCrimmon and his assistant, Mr. Sexsmith. Messrs. O'Brien and Stetson, of the Sheep Division, were also on hand to boost the sheep industry in the province.

This exhibit consisted of show cases in which were displayed sample fleeces of the representative breed types. Then there was wool in the various stages of manufacture, from the unwashed wool up to the finished worsted products.

Samples of various grades of wool were also shown, as well as of wool properly shorn, rolled, and tied, contrasted with badly cared for fleeces. The comparisons were evident to all concerned, and when one considers that the most money is realized from the grades which are properly handled and cared for, he is foolish indeed who does not do his best to follow the ideals set forth by Messrs. O'Brien and Stetson and the other gentlemen who worked with the wool display.

The whole display tended to show how the best advantages may accrue to both producer and buyer.

THE HORTICULTURAL HALL

contained a considerable display of fruit and flowers. Mr. Geo. H. Vroom placed the awards in the fruit section. The fruit, as might be expected at this early season, was quite green, but the earlier varieties showed up well colored and clean.

Following are the most important awards:

County Collections

Halifax—1, Mrs. Frances Turner, Halifax.

Lunenburg—1, H. F. Hebb, Bridgewater.

Digby—1, W. D. Ryerson, Bear River.

Annapolis—1, H. E. Bent, Tupperville; 2, B. F. Chesley, Bridgewater.

Kings—1, H. D. Johnson, Wolfville; 2, A. B. Graves, Kingston Village.

Hants—1, A. G. Sangster, Falmouth; 2, Cecil Lyon, Falmouth; 3, Thomas Aylward, Falmouth.

Colchester—1, Geo. M. Anderson, West New Anna; 2, Aubrey Byers, West New Anna.

Pictou—1, Thomas C. Latham, Sylvester.

Best County Collection, A. G. Sylvester.

Apples in Boxes—Gravensteins, H. E. Bent; Wealthys, H. E. Bent.

Best and Most Valuable Collection Apples—1, A. G. Sangster; 2, B. F. Chesley; 3, H. E. Bent.

Best Collection 10 Commercial Varieties—1, A. G. Sangster; 2, H. D. Johnson; 3, H. E. Bent.

Best Collection 5 Commercial Varieties—1, H. D. Johnson; 2, B. F. Chesley; 3, H. E. Bent.

Best Collection New Varieties—1, A. G. Sangster; 2, H. E. Bent; 3, Thomas Aylward.

Best Collection Crab Apples—1, A. G. Sangster; 2, Geo. W. Anderson.

Pears

Best 10 Varieties—1, H. E. Bent; 2, B. F. Chesley; 3, A. G. Sampter.

Best 5 Varieties—1, H. E. Bent; 2, A. G. Sangster; 3, B. F. Chesley.

Plums

Best 15 Varieties—1, H. E. Bent; 2, B. F. Chesley.

Best 6 Varieties—1, H. E. Bent; 2, B. F. Chesley.

Grapes

Best Collection—1, A. G. Sangster; 2, B. F. Chesley.

Collection Fruit Preserves—1, Mrs. H. E. Bent; 2, Mrs. F. J. Porter, Wolfville.

Collection of Jellies—1, Mrs. H. E. Bent; 2, Mrs. F. J. Porter; 3, Mrs. G. M. Dickson, Truro.

Collection Pickles—1, Mrs. F. J. Porter.

THE POULTRY BUILDING

was well filled with poultry of all classes. Some of the birds were badly in moult, but otherwise the showing was most creditable. Mr. Seth Jones, Poultry Superintendent for New Brunswick, placed the awards.

The Poultry Division of the Dominion Department of Agriculture had an instructive exhibit illustrating the proper care and handling of eggs from the nest to the consumer's table. An egg candling station was in operation, and the work of the egg circle movement was fully explained.

The awards in the poultry section will be found on other pages of this issue.

THE HORSES

As already stated, the horse show at Halifax was this year inferior to that of other years in point of numbers. Mr. John Boag, of Ontario, judged the heavy horses, and Dr. Reid placed the awards in the light-horse classes.

Standard Breds

There was a good showing of aged Standard Bred Stallions on the track. Hammond Kelly's Major Todd captured the first prize, Blake Bros.' Eddie De Forest came in for second money, and R. A. Backman's Lookout stood up in third position.

In the three-year-old stallion class there were but two entries—T. D. Blaikie's Micmac, by Achille, and J. Edgar Smith's Brenton S., by Achille, placed in the order named.

Blanchard Brenton's Brentwood, by Achille out of a sister to Israel, was the only two-year-old stallion in the class.

Two yearling stallions faced the judge—one by Capt. Aubrey, the other by Achille. The former captured the red ribbon.

In the brood mare with foal section Mr. E. J. McKenna's Kitty Giltner, by

Gazette, and her foal, by Royal Pandect, came in for first money, with mares shown by G. A. Polley and W. H. Muir in second and third positions.

The four-year-old filly class was led by T. C. Latham's Harriet King, by Robert King. Harriet was first and champion mare at Halifax in 1915.

A General Bingen filly headed the two-year-old class, while first and second places in yearling fillies went to the get of Achille and Major Stratton.

Bengara, Royal Pandect, and Major Stratton foals came in for the red, white, and blue ribbons respectively in their class.

Blanchard Brenton's Princess Achille by Achille, yearling filly, was the champion female of the Standard Bred class, and similar honors in the stallion class went to Hammond Kelly's stallion, Mayor Todd.

Ponies

The showing in the pony classes was very creditable. Much interest was taken by the public in a bunch of 40 Sable Island ponies stabled on the grounds and sold by auction by the Department of Marine and Fisheries before the close of the fair. The whole bunch was in very good fit, and seemed quite content with their surroundings, although formerly only acquainted with the sandy dunes of Sable.

Hackneys

were few in number, but of good quality. The most important entries being R. A. Snowball's Fillgrave Royal John, a mare shown by W. Anderson, Halifax, and two fillies, one by Fashioner, the other by Island Swell, shown by Geo. L. Boswall.

General Purpose Horses

were particularly few in number this year.

Agricultural Horses

This class was a walkover in each section, as will be seen by the list of winners elsewhere in this issue.

Heavy Draughters

Sharp & McNeil, of Windsor, showed some very fine heavy draughters, the get of Baron Frederic.

McFarlane Bros. showed a brood mare with foal by her side, and Frank Archibald, Truro, showed a handsome matched pair of dark greys.

The Clydesdale Class

made the best showing of all horse classes at Halifax.

Snowball's Baron's Own, Sharp & McNeil's Golden Nugget, and McFarlane Bros.' Boreland Crest were placed in their respective order in the aged stallion class.

Snowball's Kelvin's Pride, by Baron Kelvin, led the two-year-old stallion section, and also captured the male grand championship. Prescott Blanchard's Hillside Baron, by Royal Baron, stood in for second money in this class.

A Baron Squire yearling stallion shown by McFarlane Bros. had no competition in his class.

There were three fine brood mares with foals by their sides, and the judges awarded prizes as follows: Snowball's Rose of Litterty with foal by Baron's Own; McFarlane Bros.' Bess Spencer, by Sir Simon, and foal by Baron Squire; and Blanchard's mare by Baron of Bucklyvie, and her foal by Lord Ullen.

McFarlane Bros.' Nell Bowie, by Golden Chief, had no competition in the four-year-old filly section.

A Royal Baron filly shown by Mr. Blanchard had a similar walkover in the three-year-old class.

Two Baron Squire fillies and a Handy Andy competed for honors in the two-year-old class, and were placed in the order named.

Baron Squire, Baron's Own and Lord Ullen were the sires of the respective prize winners in the foal of 1916 class.

McFarlane Bros.' Nell Bowie captured the diploma for best female, any age. The best Canadian-bred female prize went to Blanchard's Hillside Miss Trim, by Royal Baron.

Snowball's Baron's Own was awarded first money for best imported stallion, closely followed in second place by Sharp & McNeil's Golden Nugget.

The Queen Hotel Cup for the best five horses was captured by R. A. Snowball with Baron's Own, Kelvin's Pride, Rose of Litterty, Jennie Lind, and the Hackney stallion Fillgrave Royal John.

THE BEEF CATTLE

were judged by Mr. Calder, of Ontario. He found two good herds of Shorthorns shown by J. M. Laird & Son, of Kelvin Grove, P. E. I., and A. N. Griffin, New Minas, N. S. Both herds were out in fine fettle. The majority of the young stock in both herds was by Stately Monarch, formerly owned by Mr. Griffin, but now at the head of the Laird herd.

The female championship went to Laird's Elmdale Rose Drop, shown in the twoyear-old heifer class.

Stately Monarch was the male champion and sire of the best three animals get of one sire.

Laird's Emily of Willow Glen, second prize cow in the four-year-old and over section, was first with two of her offspring.

The aged herd prize went to Laird & Son, and the breeders' young herd prize to Mr. Griffin.

Herefords

William O'Brien & Sons, Windsor, were out with a strong herd of Herefords, but met no competitors. They had a full entry of well fitted individuals, and were truly prepared to meet competition.

Devons

W. A. Pinkney was on hand with his uniform Devons. He, too, had no competitors.

Aberdeen Angus

Horne Bros., Winsloe Station, P.E.I., were the only exhibitors of Doddies. Horne Bros. are young breeders who made their bow for the first time at Halifax. They made a very creditable showing.

Grade Beef Cattle

were shown by E. S. Congdon. William O'Brien & Sons, Robert McLeod, and Thomas Aylward.

Fat Cattle and Working Oxen

There was a large entry in the class for fat cattle and working oxen. The best showing made in these sections at Halifax for many moons. Prize awards will be found on another page.

DAIRY CATTLE

The showing in the dairy classes at Halifax surpassed all shows previously held in Nova Scotia, with the possible exception of the year when the Dominion Exhibition was there held. In fact, we would judge that this year's show excelled that of Dominion Exhibition year, because although there were fewer exhibitors in the respective classes this year there were more high-quality animals found in the respective herds than was the case on the previous occasion. Herds that at the time of the Halifax Canadian Exposition contained one or two or three outstanding typical animals, and the balance varying in type, have now been bred up to a surprising consistency in breed, type, and conformation. It is quite evident that weeding out the inferior types has been consistently followed by our Maritime Province breeders.

Mr. Alex Hume, of Menie, Ontario, placed the awards in the Ayrshire, Holstein, and their grade classes. D. G. Duncan, of Don, Ontario, judged the Channel Island breeds and their grades.

The Ayrshires

made a particularly strong showing. Prescott Blanchard and John Retson, Truro; A. McRae & Sons, Charlottetown; John McDonald & Son, Shubenacadia; and McIntyre Bros., Sussex, had their herds out in the pink of condition. McIntrye Bros.' Morton Mains Amantha and McRae's Hobsland's Tumphie's Heir were the only contestants for honors in the aged bull class. Morton Mains Amantha captured the red ribbon, and later the male championship, while Hobsland's Tumphie's Heir stood in for the blue ribbon, and later led the aged herd to victory, and was first with three of his get—the sire of second and fourth prize quartettes get of one sire, and the sire of many promising youngsters among the winners in the other sections of the class.

John McDonald & Son had the only entry in the two-year-old bull class.

McIntrye Bros. led the way with yearling bull, followed in second and third places respectively by John Retson's Pink Pills and one shown by John McDonald & Sons.

In the bull calf class Prescott Blanchard captured the red ribbon with a half brother to Peter Pan, the grand champion male at Toronto this year. McRae, McIntyre, and Retson came next in the order named.

There was a strong showing of matronly dry aged cows. Prescott Blanchard Howie's Bright Lady, a daughter of the famous Peter Pan, led the way. Howie's Bright Lady was imported from Scotland by Mr. Blanchard when she was quite young. She is the dam of Hillside Peter Pan, the champion bull at Toronto this year, and also the dam of the first prize bull calf. In the dairy test at Amherst she won second place in her class, all of which tend to prove that Howie's Bright Lady is not ony a show cow and producer, but also a prepotent dam of show ring winners.

Mr. Blanchard was, practically speaking, only a boy when he selected Bright Lady, and he certainly must feel proud of his choice and the success she has attained.

Two McRae cows in second and fourth positions sandwiched Retson's Jennie Imp, the latter a first prize winner as three-year-old in 1913, and at one time second in her class in the Amherst dairy test.

A. McRae & Sons captured the red ribbon in the four-year-old and over class for cows in milk, with their Nellie of Springbrook Farm, and with her also captured the female championship.

McIntyre Bros.' Morton Main's Lady Nelly was first with two of her progeny, and the dam of two the progeny of one cow winners of the first prize Ayrshire Special in this class.

McIntyre Bros. led the way with breeders' young herd.

Blanchard captured the Ayrshire Special for animals get of one sire with the get of Special Spice by Spicy Sam.

Retson showed a nice senior yearling heifer by Retson's Choice out of Princess Belle, a cow with a record of 61½ pounds of milk in one day.

The other awards in the Ayrshire class, which we must pass over without any special mention, owing to lack of space, will be found on other pages of this issue.

Jerseys

H. S. Pipes & Son, Cann Bros., Blake Bros., and T. C. Latham exhibited Jerseys. The major portion of the prizes went to the Pipes and Cann herds. The contest was lively throughout, and there were no walkovers for anybody.

In the aged bull class Pipes & Son's His Reverence captured first money. The second award went to Cann Bros.' Figgis Fox Glen Fox O'Dreamwold, and Blake Bros.' bull came in for third.

In the two-year-old bull class Pipes & Son had the only entry, Bright Knight by Bright Prince. They also had the first prize winner in the senior yearling bull class in Ben Blue by His Reverence.

Cann Bros. captured the red ribbon on junior yearling bull.

In the aged cow class H. S. Pipes & Son's Blood's Choice by Blue Blood headed the list, and was female champion and first with two of her progeny.

As a two-year-old Blood's Choice was champion two-year-old of all breeds in the dairy test at Amherst. Cann Bros.' Fox Hall's Queen and Lady Maud were the second and third prize winners in this class.

Two Pipes cows sandwiched a Cann cow in the dry cow class. In the threeyear-old class two Cann cows sandwiched a Pipes cow.

In the two-year-old and senior yearling heifers Pipes again sandwiched individuals from the Cann herd.

The majority of Pipes young stock was sired by His Reverence, who was first with three of his get.

Guernseys

were out in full force at Halifax. H. W. Corning, D. G. McKay & Son, and Roper Bros. had their well-fitted herds in a three-cornered contest. Faulkner & Hill also had a few entries.

Corning's aged bull, Island Prince of Hillside, led his class, was awarded the male championship, was first with three of his get, and headed the first prize aged herd.

Roper Bros. had the female champion in Dolly Charlotte, the first prize senior yearling heifer by Rosclander out of Dolly of the Villet.

Corning's Dairymaid of Hillside, the first prize aged cow in milk, was also first with two of her progeny. McKay's aged bull, Imported Lord Trim, captured the third award in his class. Messrs. McKay, Corning, and Roper have done more to promote the Guernsey breed in Canada than any other breeders, and their herds are a credit to their respective owners.

Holsteins

There were three strong herds of Holsteins in the ring—Harding Bros., from New Brunswick; W. M. Lea, from Prince Edward Island; and S. Dickie & Son, from Truro.

The Harding herd was back from a long circuit of fairs at Sherbrooke, Quebec, Valleyfield, and Three Rivers, in the Province of Quebec, where they were successful in capturing many of the choicest awards.

The Island herd was not as strong as usual, owing to the fact that in former years the showing consisted of the choicest animals from the herds of W. M. Lea and Fred Clark, shown under the firm name of Lea & Clark. Mr. Clark has moved to one of the western provinces, and consequently the partnership has been dissolved. As will be seen by the prize winning list, the Lea herd is not, however, a herd of weaklings, and showed an abundance of quality at Halifax.

The Dickie herd has been faithfully working up a bunch of producers, and have been phenomenally successful in the Amherst dairy tests.

In the aged bull class Lea's Ida Rookie's II Vale led the way, followed in second place by Harding's Colony Port Jake, grand champion bull this year at Quebec and Sherbrooke.

Harding's Sir Foforit Schuling, grand champion at Three Rivers and reserve champion at Valleyfield, led the two-year-old bull class.

In senior yearlings Harding Bros. again led the way with Percilla's Schuling Posch, followed in second place by Dickie's Prince Colantha Canary, whose four nearest dams have an average butter record for 7 days of over 32 pounds. He is the son of a thirty-pound daughter of the 36-pound butter in 7 days cow, Madame Posch Polly, a cow that gave 122 pounds milk in one day, 28,000 pounds milk in one year, and averaged 100 pounds milk per day for 6 months. The get by this promising young bull and the high producing cows in the Dickie herd will surely be money makers for their future owners.

The dry four-year-old cow class contained many illustrious dames. Miss La Honda, the grand champion cow in the dairy test in 1912, 1914, and 1915, at Amherst, headed the list, and was awarded the female championship.

(Continued on page 800)

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

inch—First insertion 75 cents 2 inches—First insertion $1.50; inches—First insertion $2.25.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or

ABATTOIR FACILITIES

Has any one wondered why it is that stock raising languishes in New Brunswick, with wool at hunheard-of prices and lamb, beef, and pork all selling at high levels? We see and know of all the various governments are doing to promote the live stock industry in general as to breeding methods and care and feeding. Yet here we have no growth. A little investigating will show that while our meat prices, on the hoof, seem high, they are lower than elsewhere, live hogs here being about at the same figure as dressed hogs in Toronto, while cattle are lower. Mutton, being scarcer, ranges nearer the right figure. It is granted that the cattle are, in large majority, light and not quotable alongside Western steers. But that does not apply to our hogs. The truth is that outside buyers cannot pay our farmers the price and then stand the high rate for a long haul to market, plus feeding charges en route, shrinkage in weight in transit, and loss outright from injured animals. And they cannot have them slaughtered here because there is no place to do the work, in season and out, subject to the law which says that to be transported from one to another province (the three lower provinces being treated as one for the purposes of the act), dressed meats must be examined before and after killing by qualified men and the whole work done in sanitary premises properly equipped. Since nothing in New Brunswick conforms to the very moderate requirements of the act, our farmers suffer the lack of market and are virtually forced to sell in St. John. It does not require much calculation to show that the feeding of our population of 350,000 people is not a very expansive proposition for an area of 28,000 square miles. Yet the salient fact remains that we do not do it—not by a great deal. We understand that it takes practically three cars of dressed beef from Ontario each week to feed the city of St. John alone. This represents, in good money, well over $5,000—a quarter of a million a year.

It is no part of our intention to argue for beef productino as against dairying for any locality. But we do say that our growers of any class of meats are entitled to the benefit of the world's market. As it now stands, the small live stock operators who kill for local use largely fix the prices our people get for their product, while the packers of the large centers, who ship in the better class meats, fix the price the urban or city consumer pays. Between the two lies a wide margin, as in evidenced by the flush prosperity of the traders.

Reduced to its finest terms, the Dominion Government says that while its officers in one division are willing and anxious to help our people grow more and better live stock, another branch says that our slaughtering conditions are unspeakably bad and accordingly we cannot send away the product. If we wish to eat it ourselves, well and good. That is a matter for local authority.

It cannot be said to be greatly to the credit of the city of St. John that for sixteen years there has been on the statute books authority for them to spend money to provide proper public slaughtering facilities and that nothing has been done or seems likely to be done. The public do not understand. The civic rulers do not understand. The farmer does not understand. The civic ordinances of a city like St. John surely need stirring up anyway. Think for a moment that it is illegal, there, to offer for sale undrawn poultry, whereas anywhere else under the canopy drawn birds are classed as an archaic market commodity, and rightly so—wasteful, unsanitary, perishable, and in all ways undesirable. In consequence, our farmers must fit for market in two ways. If they draw the birds they can be sold only in St. John. If they draw them they can be sold nowhere else. All this makes centralization impossible and marketing purely a hit-and-miss proposition.

Adverting again to the abattoir, it does seem to us, after all, that if, once more putting on the soft pedal, St. John is willing to use the output of slaughter houses which men who are paid to know say are highly improper, we do not see that it should worry the farmer, except as it cuts down his market to St. John alone, while, as we have pointed out, doing no one outside the drovers any good because they do not make the consumers' price.

In the last analysis, this is a Provincial matter. Experts representing private capital say our field is too small for them to invest in. It never will be any larger until an outlet is provided. That done, ten years hence would see us attracting their attention, never fear. It is not suggested that the Province enter into the dressed meat trade at all, but might not the Province guarantee the securities of a small company to undertake this necessary work, taking power to regulate charges for slaughtering service? As a practical step toward the bettering of live stock prices, which will be followed by heavier production just as certainly as night follows day, nothing could more quickly cut the knot which ties up development now. We commend this statement of conditions as they are to the careful attention of every farmer. Nothing should be done to interfere with private slaughtering by farmers for themselves. The question is purely one of surplus stock, unless St. John wakens up and asks itself for something sanitary at the same time.

FARMERS SHOULD KNOW THE NAMES OF SEEDS THEY SOW

Twenty per cent of the 400 farmers visited in the Agricultural Survey in Ontario in 1915 did not know the name of any variety of grain sown on their farms. In Dundas County, where 100 farms were visited, of a total of 86 farmers growing barley only 11 knew the variety grown. Fifty-two per cent of the 400 farmers visited in the province were growing barley, and only 18 per cent knew the name of the variety.

Only 64 per cent of all the farmers visited knew the name of the variety of oats they were sowing. This state of affairs exists not only in the Province of Quebec, but also to a very large extent in the Maritime Provinces. Those who do not know the variety used may be sowing grain unsuited for their farms. There is very little excuse for the prevalence of such conditions. Every farmer sowing an unknown grain lives within reach of some farmer who grows a known sort of proved excellence, from whom seed can be obtained. It is one of the easiest things in the world to get a good variety of seed grain. We know a great many successful growers who started with a three-pound sample procured from the Experimental Farm, Ottawa. By carefully husbanding these samples for two or three years they were able to dispense with the unknown varieties formerly grown. Hand selection and fanning mill selection pay.

WHY MARKETING IS HARD

Here are some of the reasons why the farmers' marketing problem is the hardest in the world: ruin it. It cannot be stored like coal or shoes. It cannot be held for demand. It must be sold. Cold storage offers only a partial help.

Production is seasonal. It cannot be spread out over the year to reduce overhead and keep labor constant. One crop piles on another, and there is a tremendous strain on means of distribution. He does a year's work in six months.

The supply is irregular. On account of crop failures or excess there is no way to meet a fixed demand with a fixed annual supply. In one section there is too much or too little. Moreover, there is no way of sending the surplus to a less crowded market as the manufacturer does.

The supply comes from innumerable small sources, and not from one big, wellorganized plant. There is no way of regulating or controlling the production of these small units, of standardizing it, or of handling it to keep a constant level of supply.

The means of handling—elevtors, storage houses, markets, railroad facilities—are not designed to aid the farmer. He takes what he can get.

In many cases the food stuff is not standardized. Manufactured goods is made to conform to a standard. Even in a bulk food like grains there is a great need for standardization.

When you compare these factors with the facts of distribution in other lines, you are not surprised that the farmer is centering his attention more and more on marketing. He needs to, and he needs help.

DOING THINGS RIGHT

To do things in just the right way, and at as near the right time as possible, is one secret of good crops. Perfect treatment of seed grain and seed potatoes to prevent smuts, rusts, and blights takes no more labor than slipshod methods; it does take more carefulness, more pains, more know-how, but what a liberal reward!

The vital thing is the know-how and the doing of it. That is why the best farmers who know the most are so eager to learn more. The fellows who "know it all," but whose buildings and lands fail to prove it, are the only ones who object to science in agriculture.

MARKET FOR POTATOES IN ARGENTINA

In a report to his government, published in the United States Commerce Reports, U. S. Consul Charles J. Pisar, Buenos Aires, says that during the last four years there has been a continuous increase in the importation of potatoes into Argentina, although aside from those coming from France the sources of supply have been irregular.

The annual consumption of potatoes in Argentina amounts approximately to 55,000 tons, or a little over 150 tons per day. The annual domestic production in normal times does not exceed 50,000 tons, so about 5,000 tons must come fro mabroad. Besides this, Argentina imports practically all the potatoes destined for seed purposes, most of which have been coming from France.

During the seasons of 1913-14 and 1914-15 the domestic potato crop was poor, especially during the latter season, and consequently large consignments for consumption purposes had to be sought abroad. All the potatoes imported into Argentina, whether destined for seed or for consumption purposes, are brought into the country under the custom classification of Potatoes for Seeds, on which there is no duty.

With the arge demand for potatoes in 1915, important shipments came from the United States and from Spain, although both these countries had never before figured prominently as exporters of potatoes to Argentina.

Countries Supplying Potatoes to Argentina

The total imports (in pounds) during the years 1912, 1913, 1914, and 1915, and the countries of origin, were as follows:

Country.	1912.	1913.	1914.	1915.
Germany	1,624,453	944,713	69 503	80,027
Austria-Hungary	16,225	.....	.....	147,790
Belgium	686,739	.....	.....	.....
Spain	207,052	544,101	.....	30,092,517
Sweden	.....	.....	192,904	.....
France	13,831,773	15,729,329	12,969,358	36,259,929
Italy	378,430	.....	5,877,355	402,704
Netherlands	7,274	1,439,753	123,926	554,559
British possessions	.....	.....	.....	377,784
Great Britain	17,988	201,546	248,020	552,378
United States	.....	.....	4,962,544	23,418,667
Uruguay	.....	.....	838,607	69,445
Other countries	19,842	.....	2,369	.....
Total	16,789,776	18,859,442	25,284,586	91,955,800

The potato for seed purposes most in demand here is the Early Rose. It is popular, and it seems that the Argentine grower will have nothing else. Seed potatoes should weigh about two and a half ounces each. The annual requirements for seed potatoes are about 6,000 to 7,000 tons. They must be ready for shipment so as to arrive in this country during the months of August, September, and October.

Potatoes for consumption should weigh not less than three ounces each and not over five ounces, or aproximately ten potatoes to the kilo (2.2 pounds). The white potato is more in demand for consumption purposes than the Early Rose.

Packing and Preparing for Shipment

All potatoes intended for shipment to Argentina must be packed in light, airy crates of 30 and 50 kilos (66 and 110 pounds, respectively) capacity, and in barrels of 76 kilos (167 pounds).

The smaller sized crates containing 30 kilos are the most popular, and are quite often built with a center partition. These crates should be so constructed as to permit of a free circulation of air between the slats, although at the same time providing a strong container for the potato. To give the crates more resistance they should be bound on the outside edges and also in the center with a narrow strip of chestnut bark or iron bands.

All prices should be quoted per crate and not per pound or bushel. The weights should be given in the metric system.

Sanitary Certificates for Imported Potatoes

An executive decree of Argentina, dated May 20, 1913, provides that every shipment of foreign potatoes shall be accompanied by certificates, one of sanitary origin (sanidad-origen) attesting the healthful condition of the soil in which the potatoes were grown, and the other a certificate of soundness or wholesome condition of the potatoes under consideration. These certificates must be issued by government experts in the country of origin, and viseed by an Argentine consul.

The Domestic Crop for 1915-16

The domestic potato crop of the Argentine Republic for the present season (1915-16) is reported to be abundant and in an excellent state. Growers have been favored with excellent climatic conditions during the present season, and with just enough rain during the last few months to render the potatoes in a not too watery state, so that they may keep well for some time. Local marketmen and those closely connected with the potato trade are of the opinion that the demand for foreign potatoes will be nowhere near to that of 1915. However, there always remains the annual demand for seed potatoes which American shippers should not overlook, and the demand for potatoes for consumption purposes at times when the crop falls below its normal production.

COMMUNITY BREEDING AND INDIVIDUAL BREEDING

The topic of community breeding is discussed more or less in farmers' institutes, in the farm journals, on the street corners, and every place where farmers are likely to get together, but seemingly never has been threshed out satisfactorily.

When a farmer brings in a Hereford bull, for example, many of his neighbors may declare that the Hereford is the wrong breed of cattle for that vicinity. Maybe they would be right in such an attitude toward any particular breed. It is possible that this man never asked a single neighbor whether or not he liked Hereford cattle or whether he thought that they would thriv and be money makers in their locality. Rather than seek counsel among his neighbors and friends he would spring a surprise on them and trust to his own judgment or good luck to win out. There are men who seemingly are so intent on such a surprise, or are so fully grounded in their self-conceit, that they scarcely have any live stock or even farm machinery like any one else's in the community. A man frequently takes issue with a neighbor that this or that breed of live stock has off colorings, styles of build, or inherent dispositions that he dislikes. He may ignore completely the question of economical gains under similar conditions. We all have fancies for these little things that we like, and rightfully, too, but we should be able to lay some of them aside on occasion when it comes to a matter of co-operation and larger gains. There are few instances on record where team work in community breeding has not brought good results.

There are a score of advantages that come from community breeding. The up-to-date farmer has decided unanimously in favor of the pure bred, be it horse, cow, sheep, hog, or fowl. It goes without argument that it is better for farmers having the same soil, climate, and market conditions to put their capital together and buy one high class sire rather than for each to take his little portion and buy a questionable sire of a breed that few, if any, of his neighbors have. This is especially applicable to the horseman or cattleman, as good sires in these branches of live stock cost more than the average breeder can afford. When it comes to marketing the various animal products or surplus breeding stock we find many advantages in favor of co-operation. A community tying together on a certain breed of chickens gets a nice premium above the average on eggs, because they are uniform in size and color. When a company of farmers joins hands on a breed of dairy cattle good sires take the place of many questionable ones; their surplus breeding stock brings a nice margin above market values, and if one man does not have what the purchaser wants in all probability his neighbor has.

We need not confine community breeding to live stock alone, but may extend it to fruit, vegetables, and grains, and reap equally satisfying rewards. Community breeding also is one of the strongest arguments in favor of the community farm adviser, as his work is sure to pave the way for more co-operative activities among country folk.—Breeders' Gazette.

MAKING THE SOIL FRIENDLY

There is one phase of the lime discussion which does not seem to be thoroughly brought out. The writer has many times heard Prof. Alva Agee use the term, "Make the soil friendly." I know of no other truer maxim than the above quotation. Most any farmer can get a good stand of the grasses and clover if his soil is in good heart, properly seeded, and followed by plenty of moisture through the summer.

The moisture conditions of the greater part of New England for the past six years have been against seeded grasses. These are usually sown with spring grain, either oats, wheat, or barley, which in a dry time use up the soil moisture to such an extent as to largely kill out the grasses in an unfriendly soil. In the past I have laid this dying out of the new seeded grasses entirely to drouthy conditions, but such is not the case, at least in a good many instances. Newly seeded grasses will die out in a very dry time in an unfriendly soil, although it may be rich in plant food, when were the soi lfriendly the same amount of dry weather will have but little effect in preventing a good catch with a heavy yield the following year.

To test a field, as to its need of lime, the writer limed a small plot some 50 feet square on the top of one of the dryest knolls in the field. This was applied in September, when the sod was being worked up with a cutaway harrow, preparing it for potatoes the next season. When it came to grass following potatoes this limed spot had a heavy crop of hay, while the balance of the field had a very poor crop, killed out, according to my old opinion, by a six weeks' drouth in the early summer of the year it was seeded. Yet there was a fine catch of clover on the spot made friendly by liming two years previous.

There is a grave question in my mind whether or not part of the troubles of the potato growers of southern Maine are not traceable to the lack of lime in their soils. It has seemed to me that limed soil was not favorable to some of the potato diseases, like Rhizoctonia. Thus I have in a small way been liming some of my potato land previous to planting potatoes, and this has brought out very forcefully the difference between having a soil friendly to the grasses or hostile to them.

In the spring of 1913 I limed a small patch of two and a half acres. This was plowed on an average of 10 inches deep being well turned, and one ton per acre of agricultural lime broadcasted on the furrow before harrowing. The season being dry no apparent result was noted in the growth or freedom from disease in the potatoes. The patch was plowed in the spring of 1914 and sown to wheat and seeded about May 15. Both grass and clover came finely, but no better than I have had it on most of land I have seeded in the last ten years; but, contrary to all my seeding where no lime has been used, this lived through the dry weather and was a fine sight after the wheat was harvested. A part of this piece was clay and low, and I fully expected the clover to be all winter killed on this low clay portion of it. Today (June 14) the growing grass it at least two feet high and stands as thick as any I have ever seen on any field, and will produce a very heavy crop of hay even if no rain falls before it is cut.

This piece has never had any barn dressing on it since I have farmed it —some fifteen years—and probably not for thirty to forty years in all. The point is that the soil was made friendly to the grasses by the lime, which, being applied on the furrow before fitting to plant potatoes, the cultivating of the potatoes, digging, with the plowing and fitting for the wheat the next season thoroughly worked the lime through the soil plowed, so that the whole mass of it was in the friendly condition so aptly set forth by Prof. Agee.

Had this lime been applied just before sowing the wheat and seeding, I doubt very much if the results would have been so tremendous. It would not have been possible to have gotten it so mixed through the whole depth plowed as to have made those friendly conditions that would have carried the young grass through a long summer's drouth, a long dry fall, and hard spring conditions following.

I have hardly, if ever, seen the grass in general looking so poorly on this date as it is at the present time all over the southern part of the state, yet were all my fields as friendly to the grasses as is this two and a half acre piece I have describe dabove I would harvest as large a crop of hay as the farm ever produced.—E. A. Rogers, in Maine Farmer

USE OF LATE FALL PASTURE

We all like to make use of cheap pasture as long in the fall as possible, but it is a great mistake to make use of it so long that cattle commence to shrink. Let an animal start losing in weight at this season of the year and wintering in good shape is much more difficult.

We always aim to start "piecing out" a pasture before there is any noticeable shrink in the cattle, doing it with a feed of fodder once a day. By adopting this plan it is possible to keep cattle on pasture for a greater length of time than if the change is made entirely and at once from pasture to dry feed. We like to have on the farm a few acres of some forage crop that may be used as an aid to short fall pastures. With no bad storms, it is often possible to make a pasture half feed cattle for a month after no use of it could be had at all if the plan of using it only as long as it furnishes a full ration is adopted.—H. H.

Prize Winners at the Halifax Exhibition

HORSES

Standard Breds

Stallion, 4 years old—1, Hammond Kelly, Charlottetown, Major Todd; 2, Blake Bros., Shubenacadic, Eddie De Forest; 3, R. A. Backman, Lunenburg, Lookout.

Stallion, 3 years old—1, T. D. Blaikie, Great Village, Micmac, by Achille; 2, J. Edgar Smith, Kingston, Brenton S., by Achille.

Stallion, 2 years old—1, Blanchard Brenton, Brentwood, by Achille.

Stallion, 1 year old—1, W. H. Muir, Halifax, by Captain Aubrey; 2, T. D. laikie, Achille.

Brood Mare with foal—1, E. J. McKenna, Kingston, Kitty Giltner, by Gazette, foal by Royal Pandet; 2, G. A. Polley, Lunenburg; 3, W. H. Muir, by Achille.

Filly, 4 years old—1, T. C. Latham, Sylvester, Harriet King, by Robert King, first and champion of 1915; 2, J. Edgar Smith, Kingston.

Filly, 2 years old—1, E. J. McKenna, by General Bingen; 2, T. D. Blaikie, by Achille.

Filly, 1 year old—1, Blanchard Brenton, by Achille; 2, H. S. Pipe's & Son, Amherst, by Major Stratton; 3, Chas. Walker, Halifax.

Foal of 1916—1, G. A. Polley, foal by Bengara; 2, E. J. McKenna, by Royal Pandet; 3, H. S. Pipes & Son, by Major Stratton.

Mare, any age—Blanchard Brenton, Princess Achille, by Achille.

Stallion, any age—Hammond Kelly, Charlottetown, Major Todd.

Roadsters

Filly or Gelding, 3 years old—1, F. M. Miller, Kingston; 2, John E. Godwin, Halifax; 3, Hugh G. Fraser, Halifax, Marico F.

Filly or Gelding, 2 years old—1, L. B. Dodge, Middleton, by General Bingen; 2, Nelson Auld, Halifax.

Filly or Gelding, 1 year old—1, Capt. S. L. McNeil, Halifax.

Pair Matched Roadsters—1, Spurgeon Gammon, New Glasgow; 2, Otis Gardiner, Shulenacadic.

Single Horse in Harness—1 and 2, Spurgeon Gammon; 3, E. J. McKenna.

Carriage Horses

Filly or Gelding, 2 years old—1, E. J. McKenna, by Marshal M.

Filly, 1 year old—1, Geo. L. Boswall, Island Swell.

Pair Matched Carriage Horses—1, Spurgeon Gammon; 2, W. H. Isnor, Halifax.

Single Horse in Harness—1, Geo. L. Boswell, French Fort, P. E. I., Gilly, by Fashioner; 2, Spurgeon Gammon; 3, Frank Adams.

Best Horse, any age—1, George L. Boswall.

Ponies

Stallion, over 12 and under 14 hands—1, R. A. Snowball, Hackney Pony. Allfire; 2, S. H. Taylor, Lower Stewiache, Dandy.

Mare or Gelding, over 13 hands—1, Allan O. McLellan, Halifax; 2, Leo Dunn, Halifax; 3, Leo Driscoll, Halifax.

Mare or Gelding, over 12 hands—1, Allan D. McLellan.

Mare or Gelding, under 12 hands—1, John R. Fisher, Truro; 2, Howard Parsons, Halifax.

Shetland Stallion—1, Miss Elizabeth Freeman, Halifax.

Shetland Mare or Gelding—1, C. P. Spencer, Truro.

Hackneys

Stallion, 4 years old—1, R. A. Snowball, Chatham, Fillgrave Royal John.

This, Madam, is Guaranteed

The good storekeeper always talks *Guaranteed Goods.* He knows that they stand in a class of their own; that they are DEPENDABLE, and that he can sell them without hesitation.

"You'll like the flavor"

DAIRYING.

A SIMPLE MOISTURE TEST

If the dairy farmer who sells butter desires to get all the profit that is rightly his, he should have a moisture test for ascertaining the percentage of water in his product. He can worry along without a Babcock test if he is not buying cream, but if he is selling butter he should have a moisture test, because without it he does not know whether he is selling butter low in moisture and losing money, or selling butter too high in moisture and violating the internal revenue laws.

After using various tests the writer has come to the conclusion that the simpler the test the better, especially for the average dairyman. The expert butter maker with a laboratory training can putter around with chemicals and can take time to make corrections for temperatures, but the average dairyman wants a test that will give accurate results in round figures quickly and easily.

Such a test can be purchased at most any hardware store or dairy supply house. Get a good pair of balances that will weigh grams, and a set of weights. Get a small aluminum cup that will set comfortably on the pans of the scale. Then get a small alcohol burner ,and the home-made test is ready for business.

Be sure to get a representative sample of the butter to be tested. A good way is to take some from different parts of the churn and carefully mix it. Weigh out a small quantity—ten grams is the best to work with. Use your pocket knife to secure the sample and to work it down to ten grams. It will seem quite a task at first to get just that weight, but practice will make it easy. You can whittle down a piece of lead to balance the cup, which will save the trouble of fooling with the tiny weights. It will be found necessary to scour the bottom of the cup frequently and to reweigh it occasionally.

Having secured the ten grams of butter, light the alcohol burner. Twist a piece of heavy paper around the cup for a holder, and slowly melt the butter over the blaze. Do not hurry. Haste causes the melting butter to boil over. After it has quit bubbling, or crackling, it may be allowed to turn slightly brown. By that time the moisture has all evaporated. If you wish to be sure, and want to appear scientific, hold a small mirror over the mouth of the cup. If moisture is still escaping it will collect on the cold mirror.

When the moisture is all evaporated, weigh the melted butter. A collegian will tell you that the butter should be cooled to the original temperature first. Well, it does make a difference, but you cannot note it on an ordinary pair of balances, and even when detected with a fine set of laboratory scales it seldom figures more than one-hundredth of one per cent.

What is the weight of the cup of melted butter? Subtract that from the original weight. Divide the difference by the ten grams, and the quotient, multiplied by 100, to express in terms of percentage, will give the per cent of moisture in your butter. For example: Say the cup weighs 8 grams, you put in 10 grams of butter, making the gross weight 18 grams. You weigh the residue, and find it to be 16.50 grams. Subtract that from 18 and it shows that one and one-half grams of moisture evaporated. Divide that by your original ten grams of butter, and you see that figures 15 per cent. The government forbids the sale of butter containing 16 per cent or more.

A moisture test such as the above can be operated by any one.—L. L. Le Bra.

FEEDING AT A PROFIT

The law of diminishing returns applies nowhere more truly than in the feeding of dairy cattle.

The more food eaten and digested the greater the flow of milk, is an infallible rule in dairying. But there is a point where the increase of milk will not be sufficient to defray the cost of the extra food. This point depends entirely upon the relative cost of the feed as compared with the market value of the milk, cream, butter, or cheese.

Thus it follows that if a farmer feeds all his herd alike, irrespective of their capacities for producing, he is bound to suffer considerable loss. The cow's capacity for producing milk is limited. It is doubtful if a maximum yield of milk is ever profitable from all the individuals of an average herd.

The liberal use of concentrated foods will increase the flow of milk, but it will not convert a bad milker into a good one.

But it generally pays to give a good milker a reasonable amount of cake and meal. Unless such an animal is well fed she will "milk herself away." The quantity of such feed should be determined and regulated by the yield of milk, the heavy milkers getting an extra supply.

Thus in the feeding of milch cows for profit the law of diminishing returns should always be kept in mind. If an accurate record is kept of the milk of each cow, and its butter fat content known, little trouble will be experienced in gauging the feed so that a maximum of profit may be gained from the herd.

WHERE TO GET GOOD COWS

This country needs more and better cows. That is the exclamation of dairymen, but they say to themselves: "Where can I get some good cows?"

The best place to get them is right at home. Use the cows already on the place to produce animals to carry on the business. Sell fewer heifer calves for veal, is the best system to get more cows to produce milk.

That too many heifer calves are being sold is a known fact. The high prices paid for vealers has been too tempting for owners, and they have been in the habit of cashing as soon as the calf arrives at the lawful age. This practice has been suicidal to a certain extent, as many grade bred calves have been sacrificed by owners who wanted milk at the time and also the high prides that vealers were

Make More Money From Your Cows

If you are still skimming cream by the old pan or can method you are not making nearly enough money from your cows. By using the

Standard

Cream Separator you can get $15.00 more profit annually from each cow in your herd. If you have 20 cows that means an increased profit of $300.—more than enough to pay for the Standard four times over.

The Standard gets all the cream—at least, it loses but one-tenth of a pound in every 1,000 lbs. of milk skimmed. Ordinary separators lose from a half to a full pound. Government Dairy School records substantiate our statements of the Standard's close skimming.

Not only does the Standard skim close, but it gives you the cream in the best condition. Thanks to its **curved wing** centrepiece the milk is distributed to the discs without "whipping" or slapping it and breaking up the globules of butter fat as the ordinary straight wings do. Good firm butter can therefore be made from the unwhipped cream skimmed by the Standard. Such butter brings the highest price.

The Standard is easily turned, too. It runs in a bath of oil, every gear and bearing being automatically sprayed all the time the machine is in motion. By removing the used oil from the reservoir every two and three months and filling it up with coal oil, the driving mechanism can also be automatically cleaned.

Another splendid feature of the Standard Cream Separator is its interchangeable capacity. The Standard is now built with one frame for all sizes of bowls. To change the capacity of the machine all that is necessary is to change the bowl and skimmers. If a man increases the size of his herd he can increase the capacity of his Standard at a very small expense.

Made in Canada

The Standard is the up-to-date machine. It is the BIG value machine. It is the BIG profit-earner for the dairyman. Let us send you a Standard so you can see it at work in your own dairy, or have it tested alongside any other separator, we care not what make.

bringing at the market.

When the old cows give out they are then stumped as to where they can get more to take their places. Dairymen of this country are good business men and they should use their ability to an extent whereby they can always have a good supply of cows on hand. It is well enough to sell off the bull calves, but more of the heifers should be kept for future use.

To get a right start in this practice is necessary. A good sire is the main essential. After the calf is born it needs warm milk for two or three weeks. It should run with the mother during this time. After that it can be kept on skim milk and calf meal and kept growing at an economical cost if necessary. The owner loses the use of the mother cow for only a short while and before a very long period has elaused the calf can be run on grass.

After the calves are on grass the time is not long slipping around until the heifers are ready to be bred and produce milk. They then will be paying dividends on the investment. It is said that ninety per cent of the heifer calves with the right breeding will mature into good cows. With proper breeding a man should be able to produce a cow that will be at least as good as the mother, and he will have an animal to be proud of. A man thinks more of an animal that he raises himself than one he purchases. He should, as he knows what he has from the start. By doing this he is protecting his future and keeping up his reputation as a producer. If this practice was carried on more generally there would be fewer men wondering where they were going to get cows to take the place of those that have become dried out.—J. M. C.

MAKING A REPUTATION

Charles M. Schwab, well known in the world of steel and finance, is quoted as having said: "If you want anything well done in life, don't engage a man of great reputation to do it. Get a man who has his reputation to make; he will give you his very best individual undivided effort."

While this is but the opinion of one man, there is much of truth in it. Apply the idea to dairying—to testing—to the cow, for instance. What are breeders striving most for? Reputation, naturally. One cow is developed and her possible standing brought out in the course of time. Then another, and another, and so on. Each animal reaches the pinnacle of its ability, each being a step in the development of a reputation.

The lesson suggested by the above quotation, applied to cows, shows untold possibilities. Think of the thousands of cows undeveloped, untested, just being "kept," and held only at ordinary value because they have not been given a chance to demonstrate their true value, which may be worth double, treble, or quadruple their present value. Undoubtedly there is a cow or two in every registered herd in the country, where testing is not done, which, were they tested, would add greatly to the owner's reputation, afford him more satisfaction in life, and make him better off financially. Grasp the opportunity at your very door. Give the untried cow a chance, and see what she will do for you. The results may be pleasingly surprising. Better try and lose than to do nothing.

On any well-regulated dairy farm the milking of the cows at a stated period is never neglected. Don't neglect the source of income.

Did you ever notice that cows suffer from homesickness? Don't you think you have been cheated if the newly purchased cow falls away in her milk flow for a few days.

Alpha Gas Engines are ideal for farm use

WHILE THE "ALPHA" IS A good engine for any purpose, it is an ideal engine for farm use because there is no "mystery" either in its construction or operation.

IT IS SO SIMPLE THAT A boy can run it. Either gasoline or kerosene can be used and it starts on the magneto and does not stop until you want it to.

THE "ALPHA" WORKS WELL and wears well. It is made from the very best material and its workmanship and design are high-grade in every particular.

JUST THINK OF THE WORK an "Alpha" will do for you!

SAW YOUR WOOD CUT your fodder, grind your corn, pump your water, run your separator or your washing machine, and do it better than you can do it any other way.

IT HAS NO BATTERIES TO fuss with or get run down or out of order.

ALL AN "ALPHA" NEEDS IS to give it a supply of gasoline or kerosene, oil it up and give it a pull, and away it goes and will run as long as you want it to.

AN "ALPHA" WOULD BE A big labor-saver on your farm, and a money-maker, too.

Eleven sizes, 2 to 28 horse-power. Each furnished in stationary, semi-portable, or portable style, and with either hopper or tank cooled cylinder. Send for catalogue.

Butter Parchment at Farmer Office

LIVE STOCK.

THE CORRECT AGE TO BREED THE HEIFER

This is a subject on which the majority of farmers are, as a rule, somewhat in doubt, but one which bears very great importance on the size, production, type, and utility of the dairy or beef herds. Never more than now have our markets demanded large, capacious breeding stock of good type, quality, and high production; yet many farmers persist in using methods of breeding and rearing least conducive to such achievements. Again, the high prices offered for milk- veal, and beef in face of very high prices of feeds tempt farmers to make the errors of poor rearing of young stock and breeding at a too early age, with resulting deterioration of the size and production of the herds.

No hard and fast rules can be made in this regard, for practices must vary with the breed, size of foundation animals, character of feeds and pastures available, weather conditions, markets, and many similar influencing factors. It is the purpose of this brief resume of the subject to deal with its most outstanding phases as applied to dairy cattle, though the same principles will with a few slight variations apply equally well to the beef herd.

As breeders of dairy cattle, we must admit that, within reasonable limits of each breed, the larger cow, able to handle more feed, particularly the cheap farm-grown roughages, is the most profitable animal. The most of us must work with herds of grade cows, and as our aim is to develop such herds to show as nearly as possible the same type and profits as the pure breds, the bull of which we are using, hence we face this problem to the same degree as the breeder of pure-bred stock.

Influence of Rearing

It is extremely doubtful if the small, half-starved, permanently runted yearlings, all too commonly found, can ever become profitable cows at whatever age when first bred. Surely Canadian farmers have sufficient ability to realize the correctness of and practice the following principles:

1. Rear only good, thrifty, typey calves.

2. Raise calves from only good cows which can show a good profit.

3. Raise calves only from a good pure-bred sire.

4. Rear these calves well to develop into more valuable and profitable animals than their dams.

Any deviation from these four principles means proportional financial loss. Without proper feeding while the heifer is young she cannot hope to reach maximum size, value, or production when mature. Good rearing is then the foundation of profitable and successful breeding. Many excellent articles on the feeding of calves and yearlings appearing from time to time in this journal should be an excellent guide to the feeder.

Influence of Age at First Calving on the Size of the Mature Cow

Much carefully compiled data on this subject from breeding records of the Dominion Experimental Farms has been collected, and many experiments are still in progress. Two points well demonstrated in the past are:

1. Heifers well reared by good feeding reach mature weight and production much sooner than when less generously fed while young.

2. Good rearing will result in a cow weighing from 300 to 500 lbs. more than fair or poor rearing; this incresae in weight representing greater frame and muscle; in other words, a stronger, more durable, greater capacity machine for milk production.

The relationship of rearing to age of first service is as follows:

1. If the feder finds it most profitable to force the calves to good size at an early age with good feeding, the heifer may be bred at from 17 to 20 months of age, to calve at 26 to 29 months of age.

2. Under such conditions heifers must not be overloaded with fat at any time, else difficulty will be met with getting them to hold to the bull.

3. Where weather and feed conditions warrant slower growing and maturing, heifers should not be bred until 24 to 27 months of age, to calve at 33 to 36 months of age. Even then they must have been sufficiently well nourished to gain good size before breeding. When conditions exist, such as in Scotland, and the heifers grow well on excellent pastures all summer and with light stable feeding run out to the fields the most of the winter, such animals may be brought most cheaply to good size at first calving by this method. However, where severe winters necessitate closer confinement, mor rapid growth by better winter feeding will almost invariably pay, and the heifer may reach maturity in size and production most quickly.

The well-grown heifer, bred to calve first between the ages of 26 and 30 months, will, if properly bred, produce well from the start, and will reach mature weight and production at from 5 to 6 years of age.

The slower-grown heifer bred to calve first between the ages of 30 to 36 months, may, if properly handled, reach the same mature weight and production as the above, but will do so at a later age.

The poorly grown heifers bred to calve first at under 30 months of age will probably continue to increase in weight and production till 7 years of age, but will never reach desired size or be as profitable producers as though better handled. Unfortunately the majority of dairy cows and heifers in Canada come in this class, and it is little wonder that the average production per cow per year is only a little over 3,000 lbs. milk, or that such a very high percentage of our cows give annually produce worth less than the feed consumed.

There may be rare instances when heifers or bulls bred from exceptionally large and coarse parents may show this characteristic intensified. Breeding such heifers to calve at 24 or even 22 months of age may add refinement and induce greater milk production. However, instances are so extremely rare that it is safe to make the rule that no heifers should calve for the first time under 26 months, and the majority not under 28 months of age.

The foregoing range of ages makes allowance for different breeds. It is well known that naturally such breeds as the Jersey reach maturity in weight and production earlier than the other breeds, that the Holstein represents the intermediate, and the Ayrshire the later maturing breeds. There is little doubt that all dairy breeds and grades of the same in Canada have a very high percentage of males and females lacking in both size and constitution and the above principles apply equally to all.

Age at First Calving vs. Production

Generally speaking, within reasonable limits, the inherited tendency to a production of milk is a greater factor than the size of the cow. However, with the same breeding and general type the larger cows will, as a rule, produce most milk, and are undoubtedly capable of manufacturing larger amounts of rough forage into milk most easily and with a resulting increased profit. Hence the heifers calving when sufficiently mature (approximately 30 months) have a decided advantage over immature females at that stage and throughout the rest of their lives.

Age of First Calving vs. Dairy Type

Heifers calving young, i.e., 24 months or under, are undoubtedly taught to produce at an early age, and will carry this refinement through life. However, the strong tendency in this practice is to greatly reduce the size, constitution, and general ruggedness, thus lessening the capacity for consumption and production, and with a tendency toward fewer years of most efficient production.

Well-grown, heavily fed heifers calving at the age of 26 to 30 months, or well-grown, slow,developed heifers calving at the age of 30 to 36 months will not acquire the same degree of dairy refinement until a year later than the foregoing class, but even so will produce more heavily than the smaller, less rugged animal. When refinement does come then we have the cow of size, dairy type and quality, which is our greatest and most profitable producer.

A word of caution in this regard may not be amiss. Occasionally a breeder carries late calving to the extreme, and by so doing induces coarseness and wealth of flesh which in many heifers will not milk off, and this habit of laying on flesh at the expense of milk production be too well established to overcome. Again, nonpregnant late two-year and young three-year heifers even on rough feed lay on flesh very quickly, are difficult to settle with calf, and sometimes slip at the pin bones and become steery and sterile, or partly sterile. This probably only happens with heifers having the least maternal instinct with resulting tendencies to light production, but it is a risk worth guarding against.

Age at First Calving vs. Size of Calf

This is a phase of the subject on which little data have been collected. The writer is convinced that the smaller and younger the heifer is at first calving, the smaller will be the first calf, other things such as sire of calf, feeding of heifer during pregnancy, etc., being equal. Well-reared, good-sized heifers will produce good-sized, thrifty, valuable calves. Is this not the explanation of the strong prejudice against a heifer's first calf, which is usually all too small and weak? Good rearing, breeding at the right age, and proper feeding during first pregnancy would quickly overcome this difficulty.

Summary

1. The age at which heifers should first calve is important, but is dependent on other factors of equal importance.

2. Sufficient size must be obtained before first pregnancy, else the cow will never acquire desired size, capacity, and strength.

3. The heifer calving for the first time, if small or very young, may show extra refinement, but never the constitution or capacity for work as though better developed at that time.

4. Calving heifers at 28 to 32 months of age is a good average, but should be varied with discreition.

5. The proper rearing of heifers to the first service, the feeding of the pregnant heifer, and the feeding and management of the heifer in milk are all practices of equal importance, each bearing on this important subject, and all going to make the most profitable rearing of the best dairy cow.—Prof. E. S. Archibald.

PORK FROM RAPE PASTURE

Hog pastures are a variable factor. Their returns vary from a heavy crop of weeds to a net profit of $100 an acre, or even more. While their importance is now generally recognized, many hog raisers do not give them the attention they merit. Pasture is the pig's laboratory for producing profit, but results depend on the kind of equipment provided and the material supplied for its use. As the owner or operator controls both these factors, it falls to the man outside the fence to make his pigs pay as they should.

Profitable pork production on pasture requires grain feeding—the providing of some concentrated feed in addition to the pasture. While grain feeding in any degree may be out of the question for many farmers this year, the outlook certainly is promising for the man who opens the granary door with a generous hand during this summer. For the northern farm rape is one of our best all-around pastures, probably surpassing clover and alfalfa in some respects.

An experiment at the Minnesota Station last year is of interest. It gives definite results from rape pastures and also furnishes an excellent example of the importance of liberal grain feeding even on the best of pasture. Three lots of pigs were fed 77 days (July 10 to September 26). In connection with rape pasture, 2 per cent, 3 per cent, and 4 per cent of shelled corn rations were used. Water and salt were available. The pigs averaged practically 50 lbs. each at the outset. At the close the 2 per cent lot averaged 97.88 lbs., the 3 per cent lot 113.43 pounds, and the 4 per cent lot 121 lbs. The daily gains were .61, .84, and .93 lbs. per big. The 2 per cent pigs ate 2 bushels of shelled corn each, the 3 per cent pigs 3.18 bushels each, and the 4 per cent pigs 4.16 bushels each. Comparing the 2 per cent and 4 per cent rations, it appears that the extra 2.16 bushels of corn eaten by each pig on the heavy ration produced 23.12 lbs. of pork, and at the same time saved over 30 days' time for the pig.

The real test of any farm operation is the net return per acre of ground employed. Figuring corn at 75 cents per bushel, and hogs at 7 cents per lb. the gains would have paid for all corn eaten and left a margin of $26.95 per acre of pasture on the 2 per cent ration, $42.84 on the 3 per cent ration, and $57 on the 4 per cent ration. If hogs be 9 cents per pound these margins would become respectively $41.10, $68.90, and $100.08 per acre. This assumes that the pig owes nothing when it weighs 50 pounds.

Charging pasture at $10 per acre, corn at 75 cents, and hogs at 7 cents, the total margin per pig, above the cost of feed, was $1.11 on the 2 per cent ration, $1.64 on the 3 per cent ration, and $1.57 on the 4 per cent ration. The larger margin on the 3 per cent pigs was due to their smaller corn consumption (3.18 bushels against 4.16 bushels in the 4 per cent lot). However, they consumed more pasture, and for that reason the 4 per cent ration shows a higher margin per acre. Pigs were carried at the rate of 15 per acre on the 2 per cent ration, 20 per acre on the 3 per cent ration, and 30 per acre on the 4 per cent ration. While only 6 pigs were available for each lot, their uniformity in all respects throughout the test indicates that later tests under the same conditions will give similar results.

With charges as given, the actual feed cost of gains was $4.60 per cwt. on the 2 per cent ration, $4.46 on the 3 per cent ration, and $4.81 on the 4 per cent ration. Similar gains in dry lot (weight 50 to 115 pounds) at the same time cost $5.91 per cwt. with corn at 75 cents, shorts at $26, and tankage at $55 per ton. Like gains in winter with feed prices the same cost from $6.38 to $6.57 per cwt. Of course corn usually is much cheaper in early winter. Self-feeding the corn would doubtless have shown considerably larger margins than did the 4 per cent ration. Moreover, the average farm will furnish at least 3 weeks more pasture than was utilized in this test. For hogging off corn or going behind steers the 4 per cent pigs would have been preferred by most feeders. Their extra 23 pounds would prove a decided advantage in either place. While they were fatter than the other lots, they

were not too fat for excellent results under either system. Both in profit and in satisfaction there is a vast difference between an outside yard under fence and a first-class hog pasture. A few weighings will tell the tale. Why not inaugurate a series of pasture demonstrations under the direction of the county agents and agricultural instructors?—R. C. Ashby, University of Minnesota.

Editor's Note: Rape grows well in the Maritime Provinces.

THE NEED OF PURE BRED CATTLE

In any enterprise it is always good business policy to take an inventory, to ascertain what is on hand.

I might read to you the numbers of living registered animals of the several dairy breeds which are owned in this country and in other dairy sections of the globe; but large numbers are grasped with difficulty. Permit me to say, therefore, that we have living in the United States at the present time ten times as many registered Guernseys as there are Guernseys on Guernsey Island; sixteen times as many registered Jerseys as there are on Jersey Island; and seventeen times as many registered Holstein-Friesians as there are in the province of Friesland. But even with this "lion's share" if we were to bring all of our living registered Holstein-Friesians now in the United States, and along with them all the living registered members of the other dairy breeds, into the state of Michigan, and discard an equal number of our common or grade dairy cows and scrub bulls, Michigan would still have only two-thirds of her dairy animals pure bred, and there would not be a single pure-bred dairy cow left in the United States outside the boundary lines of this state.

Further, as though not content with this feat, if we were to go to the four corners of the earth and collect all the pure-bred dairy cattle of all the dairy breeds, we could stow them away in a similar manner in any one of our fairly prominent dairy states.

The business of supplying the world with suitable dairy cattle is still in its youthful stages. The sun of dairy progress is scarcely above the eastern horizon. The period of our accomplishment stretches ahead into far centuries. Proceed, I pray you, with the confidence and zeal born of faith. Granting that your business, like every other, may occasionally be affected by the general condition of the world's finances, yet, being assured that the produce of your herds and the ripe fruit of your toil, your judgments—yes, of your very souls—will always receive due consideration and merited recompense at the hands of your fellow countrymen.—Prof. E. C. Anderson, in Black and White Record.

DRESSING PERCENTAGE IN FAT

The average dressing percentage of hogs is 75, while of cattle it is 53, and of sheep 48. Part of this difference is due to the method of figuring. In the case of the hog the hide, head, and feet are included in the carcass weight, while in the case of cattle and sheep the head, hide, and feet are not included. Then the hog is very thick fleshed and has a small digestive system. Cattle and sheep have large paunches and digestive systems. Sheep dress out lowest, due to the wool and the rather light fleshing of the carcass. The dressing per centage of animals of each class varies widely. This is due to the amount of flesh, especially fat, present on the carcass, and somewhat to the thickness of the hide and size of the heads and legs, and to the amount of fill or the amount of feed and water present in the digestive tract at the time of slaughtering. In hogs the dressing percentage varies from 65 to 85 per cent, with an average of 75. In cattle it ranges from 48 to 70 per cent, with an average of 53, and for sheep from 44 to 56 per cent, with an average of 48 per cent.

INTERESTING RECORDS AMONGST DAIRY COWS, SHOWING THAT LIKE DOES NOT ALWAYS PRODUCE LIKE

There is one factor which makes all breeding more or less a gamble: Like does not always produce like. This unfortunate situation is in a measure compensated for by the fact that the variation is sometimes for the better. Modest parents have been made famous by brilliant sons and daughters, while it is undoubtedly true that some of the high-priced breeding stock are not reproducing themselves.

The Guernsey Advanced Register offers some carefully tabulated production records. The list of high producing dams published in the May issue of the Guernsey Journal includes cows with two or more A. R. daughters. We find that there are 289 of these dams which have A. R. records of their own. Therefore these 289 A. R. dams which have 612 A. R. daughters represent two generations with accurate production records.

The average butter fat of the 289 dams is a little below 450 lbs.; 151 tests are below that mark and 138 are above it. If we remember that A. R. butter fat production is an abnormal function in cows as compared with the butter fat production in the ancestral stock we will expect the drag of the race to lower the average production in the daughters. In this case the daughters average more than 25 lbs. below their dams. Out of 612 daughters 331 are below 425 lbs., and 281 are above that mark. Therefore the halfway line is about 412½, with 306 above and 306 below. For comparison we may use these averages as halfway lines, designating the dams below 450 lbs. as low test dams, those above 450 as high test dams; and likewise with the daughters, those below 412½ lbs. we may call low test daughters and those above 412½ we may call high test daughters.

The dams with high records have practically the same ratio of tested daughters as the low test dams—a fact sometimes denied by skeptical critics of high test cows. Of the 612 daughters, 318 are out of the 151 low test dams and 294 are out of the 138 high test dams.

The real comparison of the dams and their daughters is arrived at by arranging the dams according to their tests in a perpendicular column and tabulating their daughters according to test in horizontal columns opposite each of these groups. In order to do this we must disregard odd pounds, decimals, and age. Let the cows be grouped in classes of 250 lbs., 300 and under 325, 350 and so on. For instance, in the 350 lb. group of dams there are 23 dams with the following daughters: 4 at 275, 7 at 300, 2 at 325, 9 at 350, 3 at 375, 2 at 400, 5 at 425, 1 at 450, 2 at 475, 4 at 500, 2 at 525, 1 at 600, 1 at 625, 2 at 700, totalling 27 low test daughters and 20 high test daughters. From these totals for all classes we find that the low test dams produced approximately 186 low test daughters and 133 high test daughters. The high test dams produced about 120 low test daughters and 173 high test daughters. In this group of 289 dams those with records above 450 lbs. produced 18 daughters under the average for every 13 above the average. Inversively, the dams below the average produced about 10 low test daughters for every 13 high test daughters.

This evidence indicates that cows with only moderate records will produce relatively low record daughters more than half the time. High test dams will produce high test daughters more than half the time. The ratio in this case is about 18:13 and 13:18.

The most significant fact about the whole comparison from the standpoint of breed advancement is that 173 high test daughters out of the high test dams include the very highest producers from among all the daughters. The 173 high test daughters out of high test dams when compared with the 133 high test daughters out of the low test dams are aehad not only in numbers but in "toppers." Of the 173 high test daughters there are 15 with records above 725 lbs., as compared with one such record from among the 13 high test daughters from the low test dams, and, furthermore, there are only 7 dams with 725-lb. records. Many more worthy cows will shortly be proven deserving a place with these 173 high test daughters out of high test dams. That ought to be a class prized and honored more than any other group of winners because they have proven themselves to be in the blood line of breed ascent. There probably always will be the outstanding individuals in many inconspicuous families, but the inertia of the produce from these 173 ought to carry the breed forward.

This bit of breed history illustrates one or two general laws which probably apply to all grain and live stock breeding:

The average production of the daughters is below the average production of the parents.

The poorer half of the dams produce more than their share of the low producers.

The better half of the dams produce more than their share of high producers. In this case the ratio is about 18:13.

The produce of the better half of the dams includes the very best daughters, showing a marked tendency to advance the upper limit of the breed.—Chas. D. Kirkpatrick, in Hoard's Dairyman.

GROW MORE WOOL AND LESS WEEDS

Sheep were the first animals domesticated by man. They were pre-eminently adapted to grazing purposes. This has led to the belief that sheep belong only to rough frontier country. English farmers have demonstrated the fallacy of this belief by making sheep the most profitable farm animals under intensive farming conditions.

The sheep, like the dairy cow, gives two returns annually. The fleece easily pays for the cost of feed and care for a whole year. The product in lambs becomes clear gain. The increase may be as high as 150 per cent, and no meat can be placed on the market with so little grain as mutton.

In figuring the returns from sheep the lambs and wool are not the only legitimate sources of profit. Sheep are continuously at war with weeds of all kinds. Only when they lie down together—with the weed inside—is there peace. It is impossible to place a money value on this service which they render.

Cattle pastures are becoming more weedy each year. Such pastures judiciously grazed by sheep would soon not only support the sheep but would support additional cattle as well.

Wherever sheep graze the land becomes more fertile and productive. Truly "the sheep has a golden hoof."—G. C. W.

THE AGE OF THE HERD BULL

A vigorous bull of any age is all right, but unless a big outlay for the purchase price is expected a young bull will most likely have to be selected. When a breeder matures a bull and tries out his breeding qualities he is inclined to keep him if satisfactory results have been obtained. If not, he should be sent to the butcher or sold to some breeder of grade cattle for getting good steers. But he is not the bull to use in a pure-bred herd. To be sure, if one can find a bull whose calves can be seen, and if they are of such quality as to prove beyond doubt that this is a successful sire and is being sold for no fault, it will be much better to purchase him than to run the risks in getting a young bull and trying him out in the herd. But the general rule will be to buy a yearling or maybe a calf, develop him by using him on the herd while he is growing. By the time he is perhaps 30 or 36 months old one can find out what kind of sire he is likely to be. One will have the opportunity of seeing his sire and dam, and perhaps other of the ancestors contained in the top of his pedigree. Remember that this top part of the pedigree is the most important part by far. With a young bull there is the advantage of having his entire life before him, so if one is fortunate enough to get as good a breeder as when buying the tried sire he will have a longer period of usefulness and will cost less money, too. His period of usefulness should last until he is 10 or 12 years old, and he should get just as good calves until he reaches this period in his life. I think it is a mistake to breed to a bull after he begins to weaken physically, and it is surely a great mistake to purchase one to use after he is broken down. A really excellent breeding bull is rarely on the market after he has made his mark, and the only way to get one is to buy when he is young, develop him, and run the risk of his breeding qualities. Unusual precautions should be taken in his selection, as much depends on his future.—Breeders' Gazette.

DON'T FORGET THE FARM DON'TS

Don't forget that flock of sheep. If given half a chance they will return more clear profit than any branch of farming you can engage in.

Don't forget to give the stock plenty of water. Water is as essential as feed.

Don't forget that a good cream separator is a valuable machine to have on any farm on which there are two or more cows.

Don't forget to shelter your machinery when you are done with it. Under a tree or in a fence corner is a very poor place to leave a machine. Rust and decay ruin a machine sooner than use.

Don't forget that a small gasoline engine will do small jobs more quickly and easily than you can do them.

Don't forget to use plenty of good oil on any machine you use. Oil reduces friction and friction means wear. A properly oiled machine will run longer and easier than a poorly oiled one. Oil is cheaper than new machinery or repairs.

Don't forget to see that your tires are properly inflated before you run your car. Too much pressure is likely to cause the tire to stretch or blow out, while too little pressure will cause rim cuts and the tire walls to crack.

Don't forget that an open well or cistern, or one with a poor top on it, or one close to a barn or cesspool, is a source of never-ending danger.

Don't forget that every weed which is allowed to go to seed means several weeds next year.

Don't forget the birds. If you will be a friend to them they will be both friend and helper to you.—A. L. H.

Three things will insure success on the average farm, namely: Cows, Alfalfa, and Cream Checks. If a farmer gets the first two and looks after them properly the last will come naturally.

Prof. H. Barton, of Macdonald College, Quebec, Canada, has accepted the appointment as judge of the Milking Shorthorns at the International Live Stock Exposition, Chicago, December 2-9.

The attendance at the Halifax Exhibition rolled up a total of 70,000 people during the eight days of the fair.

THE HORSE

A POINT ON HORSE JUDGING

Equilibrium means equally distributed weight or equipoise, but the average horseman does not have that in mind when he speaks of weight. He merely means "heft," as he sometimes calls it, and judges by the weight how a horse has developed and what he thinks will be his capacity for labor. The true student sees much more in the matter than that, and so we shall say something about it for the farm boys that they may better understand the subject. One seldom, if ever, hears the weight of a draft horse or light horse quoted in Great Britain or France, where horses have been so successfully produced.

To understand the significance of equilibrium in a horse it is necessary to know what "center of gravity" and "line of gravitation" mean, and where the former is located in the body. Without going into a very elaborate or scientific definition, let it be said that center of gravity means the point upon which a mass will balance, where all of the forces of gravity center, and where the forces destroy or annul one another so that the mass is at rest. The line of gravitation is that through which the force of gravity falls from t he center of gravity to the ground. If the center of gravity of the horse is known, then a plumb line dropped from there to the ground follows the line of gravitation.

The student will find that the center of gravity of the horse is located just behind the eighth rib, near to the elbow joint, and on a line drawn from the point of the shoulder to about the middle of the thigh. The exact point is found by intersecting this line with one dropped perpendicularly to the ground at the eighth rib. That means that the center of gravity is in the middle of the mass of the body just back of the elbow, or at and above the end of the back of the sternum of breast bone. Theoretically the horse would balanc on a point at the center of gravity and be at equilibrium or in equipoise.

Next remember that the base of support of a horse is formed of four broken columns (bones and joints) resting upon points which are the feet. These four feet when joined by an imaginary line form a rectangle or polygon, and if that were permanent the horse always would be in equilibrium; but the moment he moves a foot the equilibrium changes or is affected. When a horse trots he advances one hind foot and one fore foot diagonally and so is balanced on two diagonal bipeds. When he paces he moves by lateral bipeds, or two feet on the same side of the body, the other two (lateral bipeds) being off the ground at that time. It may readily be seen that the horse may also be balanced or supported on only one foot at certain times, or on two hind ones when rearing, or two fore one when landing from a jump, or may have no feet upon the ground for a moment when galloping. Equilibrium, therefore, will depend on what the motion happens to be. It is greatest when the horse is lying down, because the center of gravity is near the ground and the line of gravitation within the base of support. It is lessened when the horse rises, and the taller he is and the closer the feet are together the less will be the equilibrium.

If a horse always were in a state of rest one might make exact statements about the subject of center of gravity and line of gravitation, but remember that he is constantly moving. Each time the head is raised or lowered, or any change made in position of the body, equilibrium changes, is lessened or increased, wittingly or unwittingly, and may suddenly be thrown out of control so that the animal falls. The rule to remember is that for equilibrium the line of gravitation always should fall inside of the base of support. Whenever that is not the case the horse must move quickly to avoid falling. Changes of the line of gravitation forward within the base of support take place when the running horse advances and elevates his head, and such a change necessitates fast movements of the legs to prevent falling. Such changes are not so dangerous as those outside of the base of support to the side, for when the latter occur it is more difficult for the legs to be moved to the side to support the body than when the legs have to be advanced for that purpose. Knowing this, one should be very careful to avoid side slips when riding or driving a horse. Never turn a galloping horse quickly, nor when galloping or trotting on a cement road turn the horse suddenly to enter another street or alley. Falls readily occur at such turns and bones may be fractured. The writer once had a fine saddle horse killed by just such a foolish turn made by the groom. The animal suffered a broken back and leg by the consequent fall.

Understanding the matters we have touched upon here, the scientist alleges that "instability of equilibrium gives the measure of speed," and that is correct. There is no speed when the horse stands still. The greater the changes in the position of the line of gravitation outside of the base of support the faster will the legs have to be moved to avoid a fall. For this reason the running horse goes at a tremendous rate, for he advances his long neck, on the end of which there is a heavy head, and in so doing the center of gravity is advanced far ahead of the base of support formed by the two fore and two hind legs in their normal position. The horse in consequence has simply to chase forward to get his legs or feet under his weight, and thus avoid a fall.

The draft horse, on the other hand, does not have to move fast, but has to move a great weight, and so when he goes to start a load he lowers his head, brings it back to his chest, crouches his body, crooks his hind legs at the hocks, gets a grip on the ground with his toes, and then straightens out his hocks by action of the great muscles of his hind quarters and loin. He lowers the center of gravity, increases equilibrium, and takes full advantage of his stability and strength. Weight also enters into the proposition in holding him down and giving him the full advantage of his great muscles.

Take these matters into consideration when judging or buying horses, and the estimate of the value of the horse will be more correct than ordinarily is the case.'—A. S. A.

STARTING A BALKY HORSE

Of all vices that equine flesh is heir to, the most annoying to the average horse owner and driver is balking, or near balking, which consists in rearing or plunging when first asked to start, particularly after a few days' rest; or, what is still worse, trying to start with a jump when only half hitched. The main reason that I think it is so aggravating is that so few know how to combat it. A balky horse has the most sense, the confirmed runaway the least, of any horse.

I have bought more balky horses than those with any other vice for that reason. Once they are broken of balking, they make the best of horses, not afraid of the objects that usually scare those of other temperaments.

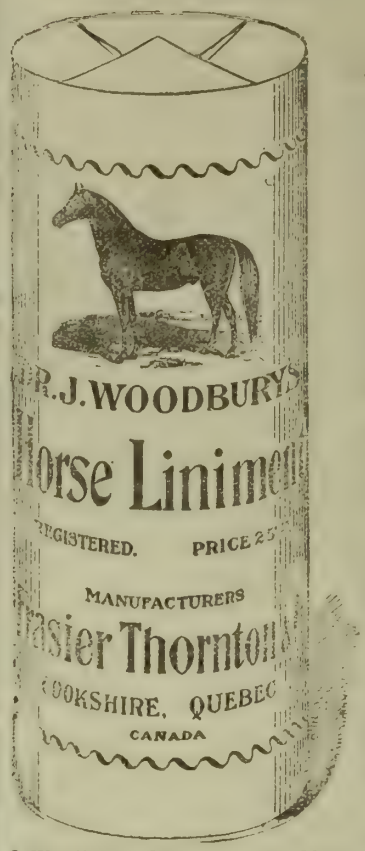
The little simple trick I am going to describe, and that has proved so satisfactory in so many cases, is not intended to break the horse of balking, which in most cases involves a lot of time, patience, and more or less thorough knowledge of horse nature, but rather to help those who have been caught, perhaps with a new horse that started away from home all right but has now balked because the conditions under which he has balked before have again presented themselves.

The average driver, when caught in this way, starts in by petting and coaxing the horse, and winds up by losing his temper and beating it until stopped by passers-by or some policeman.

A horse has only one idea in his head at a time, and in this case he has decided not to go any farther with that particular load, and the coaxing and patting are not sufficient to cause him to think o anything else. The whipping only makes him more stubborn and determined not to move. Now we have got to find something that will give him something else to think about.

Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.

Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

FRASIER THORNTON, &,CO., Limited, Manufacturers: Cookshire, Quebec, Canada.

Blood Thin and Weak Too Nervous to Sleep

Here is Another Case in Which Dr. Chase's Nerve Food Proved Its Great Reconstructive Influence.

Thin blood and exhausted nerves usually go together. A considerable portion of the blood is constantly consumed in keeping up the vitality of the nervous system. Once the blood is deficient, either in quantity or quality, the nerves suffer and bodily pains result. Headache, neuralgic or sciatic pains are the indications in some cases, while in others weakness, nervousness, irritability and sleeplessness are the most marked symptoms.

Mrs. R. F. Catlin, Elm Springs, Sask., writes: "For years I was troubled with nervousness, and could not sleep nights. Also had lack of color as a result of the blood being thin and weak. My husband saw Dr. Chase's Nerve Food advertised, and got some for me, and wanted me to try it. I did so, and it has proven a wonderful help to me. By enriching the blood, it has restored color to my face and has built up the nervous system so that I rest and sleep well. It is a pleasure to recommend so excellent a medicine.

Dr. Chase's Nerve Food goes direct to the formation of pure, rich blood, and for this reason is the most certain means of increasing the quality as well as the quantity of blood in the human system. The feeble, wasted nerves are restored, and through the nervous system new vigor and energy is imparted to every organ and member of the body.

You will be surprised at the way this food cure puts new strength and vitality into the weakened body. And the best of it is that the benefits are both thorough and lasting. In this the Nerve Food differs from mere stimulating medicines which give rise to false hope and when discontinued leave you as weak as before. Put this great restorative treatment to the test and prove its merits in your own cases. 50 cents a box, 6 for $2.50. All dealers or Edmanson, Bates & Co., Limited, Toronto.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a **HUMAN REMEDY** for **Rheumatism, Sprains, Sore Throat,** etc., it is invaluable.

Every bottle of **Caustic Balsam** sold is Warranted to give satisfaction. Price **$1.50** per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS COMPANY, Toronto, Ont.

Are you Bilious?

Don't let it run too long, it will lead to chronic indigestion. In the meanwhile you suffer from miserable, sick headaches, nervousness, depression and sallow complexion. Just try **CHAMBERLAIN'S TABLETS.** They relieve fermentation, indigestion — gently but surely cleanse the system and keep the stomach and liver in perfect running order.

At all druggists, 25c., or by mail from 11

All horses and mules more so than horses—hate to have their ears hampered. In fact, no horse ever decides upon a different course of action without first moving its ears from the normal position, and here is the key to the whole idea. As soon as it balks, get down from the seat and deliberately take one ear and push it under the crown piece of the bridle so that it is fast, and leave the horse to its own devices for a few minutes. He will commence shaking his head and doing everything he can think of to get that ear loose, until he has forgotten all about balking and his whole thoughts are centered upon freeing that ear. Now let the driver get back on the wagon, call on the horse to start, and off he goes. I have proved this trick to be successful with cow horses that thought it necessary to buck and pitch when first mounted in the morning, and with rearers in the saddle and horses hard to hitch. Leave the ear where it is for about twenty minutes, then stop and free it. Let the horse have time to shake his head and be satisfied that everything is all right again, and off he will go as pleasantly as possible.

As I said before, this trick will not break a horse from balking, but it will invariably start one that has balked on the road, provided he hasn't already been whipped an dabused to a point where nothing matters.—Our Dumb Animals.

SHOWING HORSES AT THE FAIRS

Breeders frequently try to argue themselves into the belief that they do not need to show their horses and colts at the fairs. They seek to escape the trouble of fitting and training, the expense and risk of transportation and showing, and the chance fo getting beaten in the ring. They hope that their reputation for having good horses will continue without having that fact constantly brought to public attention. Usually they change their minds after a year or two of absence from the fairs, and enter the lists again. People forget about the good horses absent breeders showed in the past; attention is given almost wholly to the horses at present displayed. The persistent exhibitor gains prestige and new friends every year, and his annual reappearance with his horses keeps his old friends steadfast. There is nothing like eternally impressing upon people's minds the fact that one's horses are among the very best in the whole country. It brings business and adds to the prices which buyers readily pay for the stock.

Some breeders command twice as high prices as others. It is largely because of showing at fairs. Their work at the fairs gives them a higher class of stock than they would produce without it. That is probably the principle reason for the higher prices. A man who does not exhibit is prone to overrate his own stock. He is satisfied with poorer individuals than those demanded by the man who is a constant exhibitor. The showman has his failings forcibly brought to mind, and he also faces the necessity of seeking improvement in every possible way in order to keep up the high standard of excellence required to win in the show ring. The breeder who begins to take things easy under the feeling that his business is fully established is almost certain to retrograde in character of stock produced and in volume of business coming his way. He is displaced in public attention by the new exhibitor. A glance over the fall fair entry lists for a term of years shows how they change from time to time. And the leading exhibitors are the leading sellers of breeding stock in nearly all cases.—Breeders' Gazette.

STALLS FOR HORSES

For horses weighing 1300 or under a good width is 4 feet. Horses over the above weight should have stalls 5 feet wide. The usual length of stalls is 9 feet. Double stalls should be 7½ feet to 9½ feet wide, according to the size of horses to be accommodated. For large draft horses stalls should not be less than 9 feet.

For horses mangers should not be made too large; to do so is merely to encourage waste of hay. Horse mangers should rise to three feet above the stall floor, with a depth of two and one-half feet, which will leave the bottom half a foot from the floor and permit cleaning out beneath. Length to be two and a half feet and depth two feet with slanting front. It is a good plan to make the bottom of slats an inch apart, which permits the fine hay that the horse will not eat to sift through and serve as bedding, and also prevents the manger becoming foul. The corners should be open to prevent accumulation of fine stuff where the horse cannot get at it, the front slat being nailed so as to rest one inch from the bottom of the side pieces.

STOP YOUR FIRE LOSS

"METALLIC" BUILDINGS ARE SAFE

WHY build with inflammable wood when you can get fire-proof, weather-proof and lightning proof "Metallic" building materials. They are far cheaper in the end. "Empire" Corrugated Iron Siding is easily and quickly laid and makes a strong rigid wall. Its light weight makes heavy construction unnecessary.

"Eastlake" Galvanized Shingles, coupled with "Hatton" Ventilator and "Acheson" Roof Lights make a perfect roof. "Metallic" building materials defy the elements. "Eastlake" roofs laid over thirty years ago are good to-day.

"Metallic built" means fireproof, stormproof, neat and durable construction.

Before buying any building materials write us for Booklet and complete information. We can save you money.

INFLAMED, BOWED TENDONS

are quickly cooled, soothed and strengthened with ABSORBINE. It is powerfully penetrating and efficient, but does not blister or cause any inconvenience, and horse can be used.

ABSORBINE

TRADE MARK REG. U. S. PAT. OFF.

is used by successful trainers, in developing fast, high-class race horses' getting them to the races fit and ready, and keeping them sound and strong throughout the season. They require a dependable, efficient liniment—one that does it work well, in a mild, soothing manner, and which, when used as a leg brace or wash, will stop inflammation and keep out the soreness from the strained, fatigued muscles, so that there will be no stiffness or "tying up" after a hard work-out or race.

ABSORBINE, used full strength when needed, and diluted for a wash or brace, helps the horse stay strong and win a race that otherwise might have been lost.

ABSORBINE reduces bog spavin, thoroughpins, wind puffs, shoe boils and other similar swellings and soft bunches; allays pain and inflammation; stops lameness quickly.

POULTRY.

THE TRAP NEST A BOON TO POULTRYMEN

There is no disputing the fact; the introduction and use of trap nests marked a new era in poultry culture. Prior to the installing of traps the individual capacity of our hens was all guesswork.

Nearly every flock has its drones. They must be weeded out. The feed and the room are demanded by the actual workers. They can be detected only by means of trapping.

An instance just happened in our own yards that fully illustrates this: One particular hen in one of the flocks is about as fine a type for egg production as the most exacting judge could wish—and yet she has not laid three dozen eggs up to August 1st. On the other hand, the champion of the flock is just of that build which would be rejected by those who think they know how a heavy layer should be.

There are many reasons why the trap nests are boons to the fraternity, a few of which are:

First—They tell us which are our best layers.

Second—They tell us the number of eggs our best layers give us.

Third—They enable us to breed from the best.

Fourth—They point out which hens ay the brownest eggs.

Fifth—They tell us which hens lay the best shaped eggs.

Sixth—They arrest the egg eater.

Seventh—They give us a chance to discover the barren hen.

Eighth—They pick out the drones.

Ninth—They prevent crowding on the nest.

Tenth—They help us knock theories in the head.

When I read the argument that too much abor and time is involved in the care of traps I make up my mind that the writer has not the industry at heart. It was the trap nest that plainly and bluntly convinced me that I was a student in poultry culture, and yet I had previously spent twenty continuous years in the work. Like all poultrymen, I had my individual opinions about hens and eggs, and many of these were shattered when the trap nests came into use.

After carefully studying the subject and making many experiments, I have come to the conclusion that the only trap nest is the one that embodies ventilation, convenience, and accuracy.

To confine a hen in a poorly ventilated trap is not only torture but dangerous. Especially so during hot summer months.

Convenience implies the easy manner n which the hen can get into the nest, and the equally easy manner in which she can be removed. When a hen is not in a broody condition she will be ready to come off the nest after laying, the moment you show her a means of exit. When she is broody, however, you must lift her off, and some of the nests I have seen are hard problems to solve when it comes to removing the stubborn broody hen.

Accuracy is the mainstay. I do not want any confining pens to trap nests. It requires too much guesswork. You find a hen in the confining pen and one in the nest part, and you have but one egg; you do not know to which hen the egg beongs. If you must guess at it or if you must compare eggs in order to find the owner you are not doing accurate work. Some nests, too, will admit two hens at one time. Such nests are a mistake. One hen at a time, and she securely penned in until you release her, is the only way in which to accurately determine which are your best hens and which are your drones.

Between the hours of nine in the morning and three in the afternoon the nests should be looked at every hour.

Of course that means an outlay of time—but it is time well spent. Yet is it as costly to spend five or ten minutes every hour to look after a lot of traps as it is to feed and care for a lot of hens that are not paying their board? And when you count on the advantage in building up a strain of heavy layers, is there not enough profit in that to pay for the time it takes to look after the nests?

We all know that the successful poultryman is continually at his post, that he gives the work his undivided attention. Then how much extra labor does it cost him to hastily glance at his nests every hour?

There is a benefit, too, outside of the egg question. Every hen must be handled to be gotten off the nest. This gives one an opportunity to notice anything wrong—slight colds, scaly legs, wounds, etc., that might be overlooked otherwise.

In conclusion, let me suggest that in putting in traps it is best to allow one trap for every three hens in the pen. This will avoid much laying outside the nest.

100-Acre Farm $900

5 Acres Corn, Potatoes

Oats, apples and garden vegetables included by owner who must make immediate move Only 2½ miles to market R. R. town. Cuts 20 tons hay, well fenced pasture, estimated 700 cords hard wood, 300 cords pulp, 30,000 ft. timber which marketed 2½ miles away will more than pay for the whole farm. Abundance fruit; comfortable 7-room house, 50-ft. barn. $900, part down, takes all. Details page 9, "Strout's Big Bunch of Bargains," copy free E. A. STROUT FARM AGENCY. Dept. 2612, 294 Washington Stree , Boston. Tel. Main 3348.

KEEP ONLY PRODUCERS

With the price of feed advancing it becomes more necessary than ever to keep only productive birds in the flock. A few good pullets or yearling hens properly housed and carefully fed oftentimes give greater net returns than a flock twice the size that does not receive sufficient attention. If the poultryman has accommodation for 200 laying hens he should endeavor to fill the pen with birds that qualify to a certain standard. This will necessitate hatching many more chicks than will be required. There is bound to be a certain percentage of pullets that give no indication of being profit producers. They should be placed in the fattening crate. They may make good roasters if they don't qualify as layers. Plenty of constitution is required and they should show some life. To the average person choosing a good bird is a more difficult task than the selection of other farm animals. The poultryman who picks pullets with a good head, alert eyes, with face and wattles of fine texture, has taken the first step toward establishing the type that generally are the best layers. Birds with dull appearance, long narrow head, or crooked breast bone should be put in the fattening crate rather than in the laying pen. As the winter advances further culling may be necessary in order to keep the flock up to the standard.

The flock of yearling hens should also be culled in the fall when not entirely disposed of. The birds which are last to moult are considered by many to be the heaviest yearly producers. With the yellow-leg breeds it is not always those with the brightest legs that should be selected as layers. It is claimed that the coloring pigment in the legs is reduced by heavy laying. In the white-faced birds the wattles lose their pure white color. Too often it is the birds with the brightest colored legs or the whitest wattles that are selected, when in reality they may be the very ones that have been taking care of themselves. It appears reasonable that the heaviest laying birds cannot look as fresh as the medium producer. The busiest birds are frequently the layers. A rule followed by some poultrymen is to select the birds that are last to go to roost at night and first to leave it in the morning.

Show qualities and heavy laying are difficult to combine in the one bird. The poultryman who makes a practice of following the shows selects and breeds a somewhat different style of bird from the one bred for utility purposes. It is as necessary to have a definite breeding and mating policy with poultry as it is with the larger classes of live stock. The non-producers in the flock keep down the average egg yield. The fewer of the unprofitable birds kept the greater the net returns from poultry raising. Trap nests are the most reliable method of distinguishing between the profitable and the unprofitable hen. On the farm this system cannot conveniently be followed; other methods must be resorted to. The flock can be greatly improved through the male bird. The utility flock should be headed by a male bird of laying stock. The Experiment Stations are commencing to keep records of the fowl and issue pedigrees for the birds. Results have proven that breeding counts for a great deal in improving the laying qualities. However, the more intensely the birds are bred for egg production the less likely are they to show fine feathers. It is for eggs and not feathers that most farm flocks are kept.

MILK FOR POULTRY

If there has been one thing definitely proved in poultry investigations it is that animal protein in some form is essential to the best egg yield and rapid growth in young stock. This element of the food can be supplied by feeding either skim milk or buttermilk. On most farms where cows are kept the buttermilk or skim milk goes in the hog trough.

While milk certainly an excellent food for hogs, my experience is that it will yield a larger profit when fed to the hens and growing chicks. The hens will not only keep healthy and thrifty, but will do their very best to keep the egg basket full.

Milk may be termed a forcing food, and is especially valuable for growing pullets. If the most is to be made out of poultry the pullets should be fully matured and laying by October, when the price of eggs is up. If the pullet is not fully matured before the cold weather sets in the probabilities are that she will not lay until spring. When the chicks are hatched in March and April, and milk is kept before them, no difficulty will be experienced in getting them to laying maturity before cold weather. Experiments have shown that the Aprilhatched pullet, fed a milk diet, will lay as soon as the one hatched in February and fed on grain alone.

In feeding milk some care should be exercised. If sour milk is fed it should be fed all the time. It will not do to feed sweet milk today and buttermilk tomorrow, as the change from one to the other will upset the fowl's digestion and bowel trouble will result. The milk can be fed alone or used to moisten the mash. Perhaps the latter method is to be preferred, since it can be fed without danger of waste, and all the fowls have an equal chance for a share.

FEED WELL AND WISELY

The need of feeding hens a well-balanced ration is shown by Missouri experiments. Four pens containing five hens each were treated just alike, except for the feed.

The test with a wide ration containing elements which would produce 3 yolks for each white laid 379 eggs in the first six month.

The test with a narrow ration containing elements which would produce 2 whites to each yolk, produced 269 eggs.

The test with a ration containing equal yolk and white material, but without minerals to produce the shell, produced 161 eggs.

The test where the ration contained elements necessary to produce equally all parts of the egg produced 1,603 eggs in the same time. This ration is called a balanced ration for egg production.

The following ration is fairly well balanced for egg production: One hundred and fifty pounds each of cracked corn and cracked wheat, 20 pounds each of wheat bran, middlings, corn meal, ground oats, and gluten meal, 30 pounds beef scraps, five pounds each of alfalfa meal and old process linseed oil meal.

For hens having free range of the farm a very simple ration is made of equal parts cracked corn and cracked wheat, and a dish of beef scraps to which they can help themselves.

TREATING LAME CHICKENS

I have frequently read about a disease in chickens which causes their feet to crumple backward, thus preventing them from walking. The usual remedy suggested is to kill them. I had a chicken so affected. The toes drew together and it appeared to have no use of its legs whatever. The only way it could move was to flutter about with outspread winds, its body resting upon the ground.

The little fellow was only a few weeks old, and I concluded to try and save him. I warmed him beside the stove until he panted from heat. Then I spread his toes in a natural position and applied a generous quantity of camphorated oil, rubbing it in well.

After that I used alcohol several times, bathing feet and legs, keeping the toes spread, and forcing him to stand upright. Then I wrapped him in a woolen cloth and put him in a warm place until he began to chirp loudly. When I uncovered him he could stand upon one foot firmly, then I put him in the pen with his mother, and in about half an hour he was running about as actively as the balance of the brood and eating heartily, although before being treated he refused to swallow a morsel.—R. Radcliffe.

FATTENING THE SPRING HATCH

The time to sell the early spring-hatched chickens is at hand. These young chickens properly marketed are money makers. They should weigh from one and a half up to three pounds, this depending on the kind of chickens raised. Birds of the Leghorn variety will weigh about one and a half pounds in July, while some of the heavier breeds will weigh three pounds and sometimes more. There is a steady demand for spring chickens at this time of the year, and we always market the surplus and in that way realize a fair margin of profit from them. The spring chickens bring from 20 to 25 cents a pound readily, and sometimes more. If sold by the pound we always fatten them before selling. The first thing I do before fattening a bunch of spring chickens is to prepare a place for them where sanitary conditions are ideal and where their quarters are dry and free from all vermin. The fattening pen we use—a home-made affair—is not over five feet ong and about three feet wide. In a pen of this size the hickens are confined and will take on fat quickly if properly fed. Fresh, clean water is kept before them at all times. There are many different kinds of feeds to fatten chickens, all of which have their merits; however, every one has his own ration for fattening, which he thinks a little bit better than any other combination of feeds.

The following ration fed liberally has given us splendid results and will fatten a bunch of chickens in a comparatively short length of time. Ra-

tion is as follows: Corn meal mash in the morning. The midday meal consists of cracked wheat and corn. At night we feed a mash consisting of boiled oats and bran. The chickens are fed liberally at each feeding. By following out this system of feeding we are able to fatten a bunch of young chickens so they are nice and plump and ready for the market in about two weeks' time. Older fowls may be fattene din the same way, except that we feed the whole corn instead of cracking it up. The corn meal mash is mixed up with milk and is very fattening. Every three or four days we give them a quantity of warm milk to drink for a change, and it is wonderful to see how nice and fat a bunch of chickens can be made in such a short length of time. Regularity of feeding must not be overlooked, as this is very important. We never allow surplus feeds to lie in the trough, but renew it each day.

Fattening poultry is just as important as fattening or caring for any other branch of live stock about the farm. Good judgment, regularity of feeding, and the proper kind of feed is all that is required to be successful.

A fattened fowl will not only weigh more, but will look better, and for eating purposes they are better than one not fattened before putting it on the market. The cost of fattening a bunch of chickens is only a trifle as compared with the additional profits received when they are marketed.—Mr. H. W. Swope.

HAVE FOWLS IN GOOD CONDITION WHEN MOULTING

When growing fowls pass through a succession of feather alterations a thorough moult of all the feathers is a process belonging to adult fowls.

A pullet that begins laying at six, seven, or eight months will not shed her feathers until she has completed her laying period if she is regularly fed an egg-laying ration and kept under clean, healthful conditions. This will make her about sixteen or eighteen months old when she moults. Young fowls that are mature and are not favored as to egg laying by food, weather, or other conditions will begin to moult before abundant egg laying, thus deferring that function.

This early moulting is not so conspicuous as the moulting of the older birds, but serves to hinder egg production for a time. Birds hatched very early in the year and maturing in summer will often do this, laying for a brief time and then suspending this function during early winter when the eggs are wanted.

Fowls hatched in April and maturing in early November will usually prolong their egg production into the natural breeding season of late winter and spring, moulting in the summer.

The period of the moult is a strenuous one for the birds. Bodily covering seems to have a psychical as well as physical relation to the condition of fowls. Observation of the flock during the moult, especially if it is a lagging process with many "undressed" birds and delay in the arrival of new clothes, will disclose an air of shiftlessness; no self conscious strutting and no happy chatting. Not only are such birds not up to physical standards, but they are below par mentally as their lack of interest indicates. The listlessness and extreme dishevelment are not necessarily a part of the revesting process, but of unfavorable conditions which retard the growth of new feathers that should quickly replace the old.

Diet has much to do with it, and so have climatic conditions and sanitation. Any mode of life that contributes to a vigorous physical condition hastens the development of the new garb of feathers.

The moulting period with most birds follows the breeding season, and with fowls at an adult age it generally follows the most active period of egg production. Unless the bird is possessed of superabundant vigor the function of egg laying is entirely suspended, the elements needed for feather formation making too great a tax upon the bird's system to admit of egg production.

Fowls should begin to moult in a plump condition, so that the falling feathers will not leave them exposed to weather inclemencies, so that the formation of feathers shall proceed unchecked and egg laying may begin as soon as possible after the moult is accomplished. They should have clean runs and be free from vermin. Grass-sown runs with some clean space for dust baths and shade from the hot sun—not a dense shade, but such as one tree or two will give—help the birds through this period.

The diet should be a complete ration, one that supplies some fat, some protein, and some mineral matter; and its sources should be various, for the birds seem to tire of one or two forms of food during the moult.

As soon as the plumage begins to look dull and ragged, partly from lack of preening and partly because the infant feather is begging the nourishment which supplied the old feather, take away highly seasoned or over-stimulating food if you have been feeding it, and give them just nourishing food, depending upon green food as a relish. Feed penned fowls three times a day, giving one meal a whole grain that combines necessary food elements such as wheat or oats. Whole corn should form another meal, and a dry or wet mash of bran, with some linseed meal, should be fed at least three times a week, using about one-sixth of the bulk of the mash linseed meal and the remainder bran or bran middlings. If the hopper method of feeding is used the wheat or a wheat, oats, and barley mixture may be kept in the hoppers so that the fowls can get it at any time, but do not feed the corn in this way, as fowls are very fond of it and will eat too much.

Pulverized oyster shell and plenty of grit, preferably crushed hard stone, should be always at hand.—M. R. C.

SUPERIORITY OF LIME WATER FOR PRESERVING EGGS

Experiments in egg preservation were begun at the Experimental Farm, Ottawa, in 1898, and have been continued every season since that date. In the course of these experiments trials have been made with more than twenty-five different fluids and preparations that have been proposed or sold as egg preservatives. The work of these fifteen years has shown the superiority of lime water over all other preservatives which we have tested. Closely following lime water is the so-called "water glass" or sodium silicate. Both, according to our results, have proven effective preservatives, but it may be remarked that it is useless to expect that either can entirely arrest that "tale" flavor commonly found in all but strictly fresh laid eggs.

Preparation of Lime Water

The solubility of lime at ordinary temperatures is 1 part in 700 parts of water. Such a solution would be termed saturated lime water. Translated into pounds and gallons, this means 1 pound of lime is sufficient to saturate 70 gallons of water. However, owing to impurities in commercial lime, it is well to use more than is called for in this statement. It may not, however, be necessary if good, fresh burnt quicklime can be obtained, to employ as much as was at first recommended, namely, 2 to 3 pounds to 5 gallons of water. With such lime as is here referred to one could rest assured that 1 pound to five gallons (50 pounds) would be ample, and that the resulting lime water would be thoroughly saturated. The method of preparation is simply to slake the lime with a small quantity of water and then stir the milk of the lime so formed into 5 gallons of water. After the mixture has been kept well stirred for a few hours it is allowed to settle. The supernatant liquid, which is now saturated lime water, is drawn off and poured over the eggs previously placed in a crock or water-tight barrel.

As exposure to the air tends to precipitate the lime (as carbonate), and thus weaken the solution, the vessel containing the eggs should be kept covered. The air may be excluded by a covering of sweet oil, or by slacking upon which a paste of lime is spread. If after a time there is any noticeable precipitation of the lime the lime water should be drawn or siphoned off and replaced with a further quantity newly prepared.

General Precautions Necessary to Take

It is essential that attention be paid to the following points:

1. That perfectly fresh eggs only be used.

2. That the eggs should throughout the whole period of preservation be completely immersed.

Although not necessary to the preservation of the eggs in a sound condition, a temperature of 40 degrees F. to 45 degrees F. will no doubt materially assist toward retaining good flavor, or rather in arresting that "stale" flavor so often characteristic of packed eggs.

Respecting the addition of salt, it must be stated that our experiments—conducted throughout fifteen seasons—do not show any benefit to be derived [illegible] ably by inducing an interchange of [illegible] lime water.

Water Glass

Water glass [illegible] using solutions varying from 2 per cent to 10 per cent. On the whole, solutions 2 per cent to 3 per cent [illegible] to 5 lbs. of sodium silicate in 10 gallons of water) have given better results than stronger soltuions. Although in the main the results have been very fairly satisfactory, we are of the opinion that lime water is superior as a preservative. Further, lime water is cheaper and pleasanter to use than water glass solution.—F. T. Shutt.

I have solved the marketing question by bringing the market to my door. When my chickens rached the proper size I advertised in the daily paper, which brought customers right to my door. Now I buy up young chicks of my neighbors, put them in a large shady pen, feed plenty of grain and green stuff, and keep fresh water before them at all times, thereby insuring good health. In this way I am able to market those that are fat and free from vermin.—Mrs. J. Martin.

BY APPOINTMENT TO H.M. KING GEORGE V

The City, At Your Door

The greatest manufacturing Silversmiths in the British Empire are brought to your door through the medium of the Mappin & Webb Catalogues.

When your name is on our mailing list, you will receive new Catalogues as they are issued. With these to guide you, it will be a very easy matter to select everything you could wish for the table, for the home, for gifts and for personal use, in Silverware, Jewellery and Precious Stones.

Should you desire to send anything of this nature to the Old Country, we will deliver the goods anywhere in England, Ireland or Scotland through our London Stores, carriage paid. Moreover, full allowance will be made in respect of Duty which will not be payable on English-made articles delivered in the British Isles.

May we have your name and address so that we may send you our new Fall Catalogue ?

A NOVEL VENGEANCE

"I'll be even with her; yes, she shall live to rue the day she ever laughed at Dick Burton, if I have to sell my soul to the devil to make 'er!"

These words were hissed rather than spoken by an excited little man who was walking rapidly along the road which led from the pretty village of Bronn to his farm some mile and a half away.

Dick Burton was not a pleasant looking man at any time, and in his present rage he was absolutely repulsive.

He had been a hard working man all his life; his father before him was a laborer who, when he died left his son nothing but the advice, which he breathed with his last breath: "Dick, get money; get it, Dick—somehow—anyhow."

And Dick had got it, and if the village gossips spoke the truth, he had not been particular how he got it.

At the age of forty he owned his own farm, which was one of the biggest and most prosperous around Bronn, and in his own opinion he was a match for any girl for miles around. That afternoon, it being Sunday, he had arrayed himself in his best, and, confident of success, had called at the little cottage where Mrs. Myrtle, a poor widowed gentlewoman, lived, and had sought the hand in marriage of her only daughter, Madge, the belle of Bronn. And she—had laughed at him! Laughed at the owner of Scraggs Brow!

Dick Burton had not courted the girl, or he might have been prepared for her refusal. It had never occurred to him to spend his valuable time hanging round any woman; he simply chose the one he considered best (and he evidently had excellent taste in feminine beauty), and then when the time came that he was prepared to take unto himself a wife he had proposed to her that he considered he suited to fill that honorable position, and had been laughed at for his pains.

But that was not all: On his way to visit Madge he had met Peter Snagg the greatest gossip in Bronn, and, feeling in high good humor with himself, the world, and Bronn in particular, he had confided to Peter, who had ventured a remark on his gay apparel, the nature of his errand. Peter had fairly stood aghast at Dick's confidences, and had exclaimed: "Why, lad, if yon bonny lass weds thee, thou'll ha' to give up farming and tak' to the show business; thee'd make a fortune as 'Beauty and the Beast.'"

Dick had been very annoyed at Peter's remark, and had made up his mind that he should not be invited to the house warming when he and Madge were married.

As he hurried home he could imagine the hilarity there would be at the "Fox and Hounds" the next day when Peter told his story to the convivial party which met in the cozy parlor each evening to drink, smoke, and gossip.

Yes, the thing was complete; he would be the laughing-stock of the countryside. As the thoughts chased each other through his disordered mind, dulled to every impulse but that of avarice, he cursed anew the girl who he considered had insulted him.

The innocent cause of all this furore was busily engaged getting ready to attend the evening service at the village church.

Her little bedroom opened out of the living room where her mother was putting away the tea things. When Madge was ready, after giving a last pleased smile at her own reflection in the looking glass, she walked over to her mother and asked if she looked "all right." Mrs. Myrtle turned from the cupboard where she was placing the crockery and surveyed Madge lovingly.

"Yes, dear," she said, "you look very nice, a white dress always becomes you; but I hope it will be warm enough; it is sure to be cool coming out of church."

Closing the cupboard doors, she took her daughter's hands in hers, and added sadly: "Madge, dearie, you grow more like your father every day you live. I pray God your life may be a happier one than his was."

The mother and daughter were very quiet for some moment, both thinking of the handsome ames Myrtle, who died at the early age of forty, a disappointed and heart-broken man, leaving his wife and daughter but a tiny annuity to live upon.

Madge kissed her mother gently, and then, hoping to turn the drift of the conversation, said gayly: "May I tell Mrs. Wilde that I might be the mistress of Scraggs Brow if I chose?"

Mrs. Myrtle caught the laughing girl by the arm, and, with a nervous look around, as though afraid some one might be listening, she begged her not to mention Dick Burton's proposal.

"I am afraid of the man, dear; his face was terrible to look at when you laughed at him. I shall never know a moment's peace when you're out of the house. A man like that will never forgive you."

"Oh, mother, dear," exclaimed Madge, "how foolish of you to think any more of the matter. Indeed, I am not afraid of Dick Burton. He knows better than to try any of his bad-tempered tricks on me in Bronn. Why, I believe the lads around would lynch him if he did." And, laughing merrily, the girl kissed her mother and started off for church.

Mrs. Myrtle stood at the door watching her pretty daughter until she turned off the road into the fields beyond which lay the beautiful old church; then with a sigh she closed the door and sat down by the window to read and think alternately.

Madge reached the church just as the bells were giving their last call to service. As she stepped into the porch the village youths who were standing there waiting until the bells stopped before entering the door, made way for her rather shyly, looking the admiration they lacked courage to express. In answer to her pleasant "Good evening," they blushed and stammered in a way which caused a man coming uj the path to ask them what there was about Miss Myrtle that turned them all into a pack of "half-baked fools."

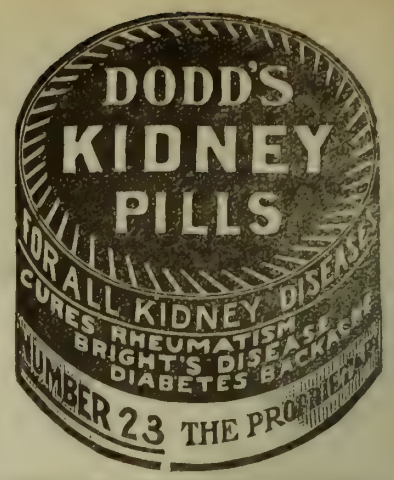
As the door had closed upon the young lady in question, their normal manners, or the lack of them, once more asserted themselves, and the unlucky questioner was not sorry when, the bells having ceased, the youths stamped into the sacred building and permitted him to follow.

The evil fire in Dick Burton's breast was fanned to fever heat by the jokes of the other farmers around. to whom Peter Snagg lost no time in telling his news of Dick's proposal to take unto himself the prettiest girl in the whole countryside. At last Dick decided to take a holiday until the matter had had time to wear itself out, and so went to Carlton, the nearest town of any importance to Bronn. Never having had a holiday before, Dick found it difficult to put in time.

One evening after thinking of his

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations bladder weakness. constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry. palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write today. Address: Mrs. M. Summers Box 309, Windsor, Ont.



A Woman's — Problem

How to Feel Well During Middle Life Told by Three Women Who Learned from Experience.

The Change of Life is a most critical period of a woman's existence, and neglect of health at this time invites disease and pain. Women everywhere should remember that there is no other remedy known to medicine that will so successfully carry women through this trying period as Lydia E. Pinkham's Vegetable Compound, made from native roots and herbs. Read these letters:—

Philadelphia, Pa.—"I started the Change of Life five years ago. I always had a headache and backache with bearing down pains and I would have heat flashes very bad at times with dizzy spells and nervous feelings. After taking Lydia E. Pinkham's Vegetable Compound I feel like a new person and am in better health and no more troubled with the aches and pains I had before I took your wonderful remedy. I recommend it to my friends for I cannot praise it enough."—Mrs. Margaret Grassman, 759 N. Ringgold St., Philadelphia, Pa.

Beverly, Mass.—"I took Lydia E. Pinkham's Vegetable Compound, for nervousness and dyspepsia, when I was going through the Change of Life. I found it very helpful and I have always spoken of it to other women who suffer as I did and have had them try it and they also have received good results from it."—Mrs. George A. Dunbar, 17 Roundy St., Beverly, Mass.

Erie, Pa.—"I was in poor health when the Change of Life started with me and I took Lydia E. Pinkham's Vegetable Compound, or I think I should not have got over it as easy as I did. Even now if I do not feel good I take the Compound and it restores me in a short time. I will praise your remedies to every woman for it may help them as it has me."—Mrs. E. Kissling, 931 East 24th St., Erie, Pa.

No other medicine has been so successful in relieving woman's suffering as has Lydia E. Pinkham's Vegetable Compound. Women may receive free and helpful advice by writing the Lydia E. Pinkham Medicine Co., Lynn, Mass. Such letters are received and answered by women only and held in strict confidence.

upposed injuries until his impotence to even matters up with his tormentors nearly drove him distracted, he walked into the first place of entertainment he came across, and sat down, longing for anything which would make him forget for a time his own miserable self. It happened to be a large lecture hall into which Burton had strayed, where a professor of hypnotism was lecturing to an attentive if select audience. The country farmer, who had never even heard of hypnotism, could make nothing of the professor's discourse. Later on in the evening the lecturer asked men from the audience to come to the platform. About thirty young men volunteered, and in a few minutes the professor had placed half of them in a hypnotic sleep. The rest of them he sent down, telling them they needed mental development before they would make good hypnotic subjects. Burton became convinced that the professor was a sorcerer, and quietly changed his place to a seat nearer the door. The evening wore on, and Dick's eyes opened wider than they had ever done in his life before.

As he watched the men on the platform do anything and everything the lecturer suggested that they should do, and then at a snap of his fingers regain their ordinary senses and become utterly forgetful of everything that they had been doing while in their hypnotic state, the idea formed itself in his heated brain that he would offer this "corcerer" money—a lot of it—to come to Bronn and make Madge Myrtle fall in love with him, and then he in his turn would laugh in her face in view of the whole village.

The man grit his teeth and clenched his fists at the thought. As a close to the lecture the professor ranged his subjects before him in a row, and, after making passes in front of each individual face, he selected one huge, ungainly fellow, and informed him that he was the most beautiful woman in the town, and that all the men were in love with him. He then suggested to the remainder of his subjects that they each were very much in love with the handsome girl before him (the before-mentioned ungainly fellow) and that they were all dying to propose to her. The professor then walked to the side of the platform, and the fun commenced. The big man who imagined himself the beauty of the town simpered and twirled himself around in a manner which suggested a playful elephant. Th eother men were angrily pushing each other away in their frontic efforts to monopolize the "handsome girl." Miss Beauty, however, would have none of them, and, with a soul-piercing giggle, she tripped heavily across the stage daintily holding up her trousers as she went. The audience rose as one man and shrieked with laughter. When the absurdity of the "test" was at its height the professor snapped his fingers, and each man regained his normal condition in his position of adoration before the biggest and ugliest man of the party, who stood blinking his eyes and still unconsciously gripping his trousers leg. The look of shamed consternation which passed over the different faces as each man scrambled to his feet and fled off the stage brought the curtain down with shouts of laughter and applause, an drepeated calls for the professor, who bowed his acknowledgments from the front of the platform.

That night Dick Burton slept but little, and next morning found him interviewing Professor Blamire. The two men talked long together, and when Dick wended his way back to his lodgings his small eyes were gleaming like a serpent's, and his face was lined in unaccustomed wrinkles by a bland smile which spread over his evil visage.

That day he returned to Bronn, where he laughed so heartily with the first man who joked him about "his wedding bells" that the other humorists decided there was "no change" to be got out of Dick since his holiday, and in future left him severely alone.

A few days later a white-haired old gentleman calling himself Dr. Down arrived in the village and took rooms at the Fox and Hounds, where he told the landlord he intended making a long stay, as the beauty of the neighborhood delighted him. The stranger was a man of much culture, and very soon the vicar of the parish and he were on excellent terms together. In a short time he had become a frequent visitor at the vicarage, and there he met Mrs. Myrtle and her daughter.

Madge and he became very good friends. Her mother was pleased that she should have the advantage of the friendship of an old gentleman of such evident accomplishments. Ferns were a particular hobby of Dr. Down's, and as Madge knew the most likely places in the neighborhood where the rarest specimens abounded, she and the doctor were often to be seen with basket an dtrowel in hand wandering about the lanes and hedgrerows together. One day it was arranged that the two should walk to a small wood a few miles from the village, where the parsley ferns grew in great abundance. Mrs. Myrtle packed them up a basket of provisions, as the weather was too warm for them to hurry back in time for the midday meal. They walked along at a good brisk pace, reaching the wood long before noon.

"Surely, Miss Madge," Dr. Down exclaimed, "we may be permitted to call a halt in this beautiful spot; it's perfectly barbarous to go tearing through such scenery. I begin to think that you are jealous of so much beauty that is not your own," and the doctor laughed in his strange, youthful manner which so ill accorded with his grey locks, and lazily threw himself on the moss at the side o fthe running stream and waited for his pretty companion to follow his example.

"You've been doing the tearing, not I," retorted Madge. "Why, I declare you've tired me out thoroughly. For your punishment you may have the pleasure of 'grubbing' for ferns alone, for I vow I shall not go a yard farther." And with a sigh of genuine weariness the girl settled herself comfortably on a bank of bracken with a huge boulder at her back. Throwing off her hat, she sat with her hands resting in her lap, her beautiful eyes closed, her whole attitude one of utter restfulness. The doctor watched her every movement with the keenest interest, and, rising, walked softly toward her.

"I see I have overtired you," he said soothingly. "No, don't move; just let yourself go, and rest thoroughly. A few moments will be enough if you go

Little Miss "MAIDEN" CANADA

My Birthday Party To-morrow, Daddy!

Watch the extra sparkle in the eyes of children—the clapping of the hands and the delighted laughter when Maple Buds are served at the party. Let them eat plenty—they are not harmful in any way; in fact they contain the finest and most expensive cocoa beans, rich, creamy milk, and the best selected sugar blended skilfully.

Grown-ups relish them too—you know that yourself.

"Mother Says We Couldn't Run The Farm Without

CROWN BRAND CORN PURE SYRUP

IT'S downright scandalous, the number of 20 pound tins I buy. But, as Mother says, we use it for 'most everything.

"Nothing else tastes quite so good on all kinds of Hot Bread, Johnny Cake and Griddle Cakes.

"Mother uses it for all her cooking—for Cookies, Cakes, Gingerbread and Pies.

"And I am almost ashamed to mention the quantity of 'Crown Brand' and bread that my youngsters consume. This syrup certainly is a favorite in my home".

The 20 pound tin is convenient and economical for home use, although you can get "Crown Brand" in 2, 5 and 10 pound tins and 3 pound glass jars. Ask your dealer.

the right way about it; now I am going to treat you as I do my nervous, overworked patients; all you have to do is to look steadily at me and think of nothing but sleep—profound sleep—sleep, just sleep, sleep, sleep!"

As he spoke he gently stroked the beautiful young face downward, keeping his long fingers wide apart so that her eyes might still meet his, which gazed into hers as though they would search into her very brain.

The girl was too utterly tired to make the least struggle against the influence she felt creeping over her. The gentle pressure of the doctor's fingers soothed and cooled her heated face, his gaze quieted her, and his gentle reiteration of the words "Sleep, perfect sleep," in full melodius tones ulled her, until her eyes drooped and at last she fell sound asleep.

Dr. Down did not relinquish his fixed gaze until he had assured himself that his subject was completely under his control; then, rising from his kneeling position, he wiped the perspiration from his face, murmuring as he spread his drenched handkerchief on the grass to dry: "Ah, that was warm work, but in time she will prove a splendid subject."

Not the faintest trace of shame entered this man's mind at having thus taken advantage of a young girl and her trustful mother to gain his own ends. He was a gentleman and an educated one, but before all he was a student of hypnotism, bound up in his beloved science body and soul, and with never a thought beyond it.

When Dick came to him the morning after his lecture at Carlton, Dr. Down, or Professor Blamire, as he then called himself, laughed his proposal of money aside, and said that he would be glad to tr ythe experiment if the subject proved a good one, as that morning he had received notice from the Carlton authorities telling him that he must give no more demonstrated lectures in the town. The professor was furious; he had just crossed from America, where his home was, hoping to get a different class of subjects in England, and no wto find himsel ftreated as a common showman and thus ordered off the green, as it were! Yes, he was ready for anything, as long as the subject was worth spending his time over.

Dick did not think it necessary to tell the professor that he intended openly to insult the girl when he was sure of her affections; he merely said that he was madly in love with her and that he would give worlds if he could gain her love in return. The professor had promptly assumed the disguise of an old man; then he had called on the vicar of Carlton, from whom, by means of some very tall lying, he had secured a letter of introduction to the vicar of Bronn, after which he had come to that village ready for his experiment. He had not hurried matters; his "subject" was a delicate one, and he knew it. He had spent his time feeling his ground and establishing perfect confidence in himself in the girl's mind, and now the reward was his, for once hypnotized he knew that he could always repeat the process without further difficulty.

When Dr. Down was pleasantly cool he returned to the sleeping girl, and once more fixed his keen gaze upon her face, making several passes before her closed eyes; then in a mnontonous, soothing, insistent voice he informed her that she had enjoyed a very refreshing sleep and was thoroughly rested. He waited a few seconds and then continued: "When next I propose sleep to you you will at once answer my suggestion by falling into as profound a sleep as you are now enjoying. Listen attentively: Tomorrow you will meet Dick Burton, he will wish you good day, and you will at once shake hands and be very friendly with him; you will walk down the village together, and when he leaves you at your own gate you will be very sorry that you ever refused to marry him, for you will realize that he is a good, honest man, and that he loves you very truly, and you will then love him. You hear me; before you part you will have found out that you love Dick Burton—you—love—Dick—Burton! Now take this basket and fill it with ferns, and when you wake you must know that I, Dr. Down, have gathered them while you have been resting. Now go, gather ferns."

Madge rose and obediently filled her basket, afterward washing her hands in the stream. As she did so the doctor frowned at his carelessness in having forgotten to tell her to do so; he knew that had she awakened with soiled hands the first germ of distrust would have been sown; however, the girl's natural cleanliness had saved the situation. "Thus does reason ever aid science," the doctor soliloquized, as he led the girl back to her former position on the bracken, and then he said very gently: "Remember—now waken." Madge woke with a start, to find her old friend standing laughing down at her with a basket of ferns in his hand.

"Oh, I have been asleep!" she said guiltily, looking at the ferns.

"Yes, you lazy young lady. I wonder what your mother will say when I tell her that you have slept while your poor old friend has done all the work."

"I'm wondering what she'll say," saucily answered the girl, "when I tell her that the said 'poor old friend' walked me along so fast that I was tired out, and compelled me to lie down and sleep in the open like a sheep dog."

They both laughed, and then Madge, declaring that she was famished, fell upon their basket of provisions, and had a most delightful luncheon, which they washed down with clear spring water.

On the following day all Bronn was set in a state of the wildest excitement by seeing Madge and Dick Burton walking through the village talking affably together. Day after day the same undreamed-of event occurred. A matron of Bronn was heard to remark that "a body can't go outside the doors without meeting that queer mixture of a couple acourting like a pair o' ill-matched turtle doves."

When at last the news was announced that the pair were to be married the following month the wiseacres of Bronn slapped their pockets and winked knowingly, and all agreed that the longest pocket was sure to win, and, content with this explanation, ceased to wonder, and settled down to watch the proceedings with interest. Dick had long since given up his idea of spurning Madge, and thus avenging her former slight. After all, he was a man, and his lips were hot with her kisses, her arms had hung around his neck, and he had learned to love her with all the force of his savage, untrained nature. When she was with him he was as one drunk with the fervor of his own emotions, and when they were apart he tormented himself into a frenzy, fearing "the spell' would cease to act, and her love, which had become as the breath of life to him, should have turned again to scorn. At such moments he even prayed to God, or to God as he knew Him, and promised that he would devote part of his wealth to build a new altar in the church if only Madge still continued to love him; but should she fail him he vowed that he would live the remainder of his life to curse and defame God's name.

Mrs. Myrtle was all but heart-broken at her daughter's strange infatuation; she implored Madge with tears in her eyes to come away from Bronn and forget this fearful man; but Madge only replied with tears and protestations that she loved Dick better than her life, and must marry him or die.

The professor was in a state of delight at the success of his experiment; he did not allow one regret to enter his mind; he thought no more of the consequences to his "subject" than the vivisectionist considers the cries of his victim.

He and Madge had many more excursions for ferns and mosses, and each time Madge returned more completely infatuated with her repulsive lover than ever. At last the wedding day arrived, and Bronn turned out as one man to see the ceremony, much as the crowd gathers to witness the lion tamer put his head into the lion's mouth.

Dick was in the church, nervously awaiting his bride.

Dr. Down, who, at the earnest solicitation of Madge, had consented to act as Dick's best man, stood beside him, almost as nervous as was the bridegroom. At last a loud cheer from the boys outside the church heralded the arrival of Madge. Every one of that packed audience turned to watch the bride enter the door. Ah, how beautiful she looked in her bridal dress! The men gazed at her almost with awe, women felt a sob rise in their throats as their eyes travelled from the lovely girl to the misshapen form awaiting her at the altar. The poor heart-broken mother gave one long-drawn sigh and, sinking on her knees, prayed in her agony to God to spare her child ere it was too late.

Madge walked up the aisle quite steadily, but, it was noticed, somewhat listlessly. She heard a sigh which was almost a cry, and stopped hesitatingly and gazed around her as one awakened out of a sleep; she touched her dress wonderingly, and then said, in a voice which sounded very far away:

"Mother, where are you, dear? I heard you cry."

The congregation made no sound; it was spellbound. The mother rose and held out her arms to the child. At that moment Dr. Down walked gently up to Madge, and, taking her arm, led her to the altar, where Dick stood, his face drawn and haggard, his hands clutching the communion rail. Madge looked at Dick, and then again at her white dress. She turned a terrified face to the vicar, who stood, book in hand, watching the strange scene.

"Why am I here?" she asked, her clear young voice ringing through the church.

"You are here to be married to Dick Burton, my dear," the vicar said.

The girl turned and faced the terror-

"THE CARS OF PROVEN PERFORMANCE"

BRISCOE

Briscoe

MADE IN CANADA

BRISCOE

Four-38 { Completely Equipped } $975

Eight-38 { The price includes all the "Extras" } $1185

The New Briscoe Four-24 completely equipped $825

The Briscoe takes you where you want to go—and brings you back—up hill and over rough road—because the Briscoe motor has the proven power that delivers a little more pull than you ever demand of it. 38 Horse Power, with four or eight cylinders as you prefer.

It's a car of beautiful lines and beautiful proportions—114-inch Wheel Base, Briscoe stream line body, full cantilever rear spring suspension, deep upholstery, rich color schemes and elegant appointments.

The Briscoe Eight-38 was the first Eight Cylinder Car made in Canada. The Briscoe Four-38 was the car chosen for the light car requirements of the Canadian Expeditionary Forces.

Have you read Mr. Briscoe's own story of "The Half Million Dollar Motor"? It's a fascinating pen picture of pluck, virility and business—of pathos, determination and success. It reads like a novel, and holds your attention like a romance. Write for a copy, to-day.

stricken bridegroom. The poor wretch leaned towards her. "Madge, dearie," he whispered hoarsely, a world of tenderness in his coarse voice, his hands reaching out as though to touch her.

With a scream, she pushed him from her.

"Mother, mother!" she cried. "Save me—save me!"

Despair lent vigor to gentle Mrs. Myrtle. With a bound she reached the girl's side, and, taking her in her arms, half led, half carried, her out of the church, and, placing her in the waiting carriage, bade the astonished coachman drive quickly home.

The vicar calmly closed his book, and dismissed the congregation.

Dr. Down dragged the wretched Burton, who seemed incapable of assisting himself, out of the church by a side door. As he parted from him at Scraggs Brow he blandly remarked: "A most interesting experiment, showing clearly how little removed the ordinary mortal is, even in these days, from primeval man. The whole course of science broken down by the mere cry of a mother to her child. Interesting—very!"

MILK BOTTLED

There's many a slip 'twixt cup and lip, and there is many a microbe between the reasonably clean milk inside a bottle and the pitcher or glass into which it is poured.

Milk bottles from the very best dairies are left at our doors covered with dirt. If you do not believe this to be true, rub your fingers over a bottle and then examine them. Dust will cling to glass even after it has been thoroughly cleaned, and milk bottles, being usually a trifle greasy, are prone to hold every particle of dust which, except on rainy days, floats in clouds over and under and through the milk wagon during its long journey.

Where the common pasteboard stopper is used there is formed by it and the surrounding ring of glass a nice little circular receptacle for the convenient collection of an especially thick layer of dirt.

Then the neck and rim of the mouth of the bottle are necessarily handled by a dairy man, who has just dropped the reins of his horse, or any rate whose paws are far from clean. Add to this the licks (or worse) bestowed by passing cats and dogs upon the tops of the bottles before they are brought into the house, and one has a veritable garden of soil with living contents of all description.

After the dirt-covered stopper is removed (if it is not poked carelessly or unskilfully down into the bottle) the milk is poured over the side walls of this sunken garden, carrying with it much of the street and cat and dog deposits into the vessels from which we drink. No harm may come of it, but this is not the safest dirt in the world, and it adds nothing to the flavor of the milk.

The milk bottle the top of which is covered with a metal or paper cap that comes down over the outside of the neck of the bottle is much to be preferred, if a dairyman can be found who is so up to date as to use this means of protection; but where one cannot secure this kind of a bottle he can at least place the mouth and neck of the bottle under the faucet and let the water flow vigorously for a few seconds upon the cap and neck. A clean cloth might also be used to clean the top and afterwards the rest of the bottle, followed by shower bath from the faucet. The whole bottle should be clean before opened or set away.

It is not impossible that many cases of disease contracted from milk were due, not to the fault of the dairyman, but to the housewife, who failed to cleanse the top of the bottle before opening and pouring from it. It is at least safer and more cleanly to make use of this simple and lostless precaution against contamination.—Christian Advocate.

HUMAN DIETS LACKING IN MINERAL NUTRIENTS

Dr. E. B. Forbes, chief of the Department of Nutrition of the Ohio Experiment Station, says in a recent bulletin, that many American diets today consist too largely of meats and cereal foods which lack the outer seed coats. Such diets are deficient in minerals. Those most commonly lacking are calcium, phosphorus, and iron.

Calcium is abundant in milk, eggs, vegetables, and fruits. Phosphorus is found in large amounts in milk, eggs, peas, beans, and cereal foods containing the outer seed coats. Iron is contained in beef, eggs, prunes, beans, peas, and green vegetables, especially spinach. Foods poor in minerals are polished rice, pearl hominy, white flour, bolted cornmeal, and other cereal foods lacking the outer seed coats. Such foods are likely to be constipating. More liberal use should be made of milk and vegetables, especially for children.

In artificial feeding of infants Dr. Forbes says whey should be used instead of water for diluting cow's milk, because whey does not reduce the mineral content. Whey can be prepared from skim milk by the use of rennet, or from whey powder, which is simply evaporated whey. If whey is made with rennet it must be heated to 154 degrees F. before mixing with milk. Sodium citrate (1 grain per ounce of milk) prepares the casein for digestion and furnishes an alkali element needed by infants lacking capacity to digest fat. Whey is especially valuable in cases of fever in children beyond the age of infancy. It can be used with egg white or orange juice to advantage, according to the Experiment Station expert.

ERRORS IN TRAINING

The greatest and most common error in the training of children is allowed to be irregularity of behavior toward them. At one time they are coaxed, petted, and indulged in every fancy, and at another they are scolded, abused, and cruelly chastised. One moment a mother will be seen fondling her child, and the next pouring out her wrath upon him. Impetuous in temper, she will, for a trifling fault, inflict personal punishment on her infant, and then, moved by compassion or remorse, seize him up in her arms and cover him with caresses. All this is decidedly improper and ruinous to the disposition of children. Let it be remembered that example will go a great way in communicating both good and bad habits to children, and it is required of those who undertake the duty of infant education that they should learn to know themselves and command themselves. Another common error is favoritism in families. One child, because he happened to be born first, or is called by a particular name, or from some other equally absurd cause, or perhaps from mere caprice, is idolized and advanced, while all his brothers and sisters are treated with indifference. Much strife and petty misery have arisen from this system of favoritism, which, wherever it occurs, is discreditable to the parental relation. All the children in a family, whatever be their capacities, and whether male or female, should be treated with equal consideration and kindness. On no account prefer one to another.

A GOOD HAIR WASH

Green soap is a valuable preparation for the woman, especially the dark-haired woman, who would preserve the lustre of her locks. You can make it at home, and so be sure of its purity. Take equal parts of the very best green Castile soap, of water, of alcohol, and of glycerine. Heat the water and shave the soap into it. Then stir it in your double saucepan until it is perfectly smooth. Add the glycerine and stir again very thoroughly. The alcohol is added last of all, mixed with two ounces of essential oil of any preferred scent. A small quantity of arris root, for instance, gives a suggestion of violet, while oil of verbena, or oil of rose geranium, gives an old-fashioned, wholesome scent. Rinse the hair that has been washed with this soap two or three times.

HOW TO TRIM THE LAMP

Good oil can be made to burn badly and poor oil can be made to burn well The following are some rules for getting good service out of the lamp:

The wick, to begin with, should hang straight down in the oil. Then the oil will pass more freely to the flame, and a better light will be obtained.

The wick should be cut with as thin an edge as possible. If it has a broad burning surface at the top the flame will be yellow instead of white.

The chimney should be tight to the brass burner, so as not to let air in where air is not wanted.

The holes at the bottom of the burner should be left open, so as to let plenty of air in where air is wanted.

The wick should not be turned so high that it will char or smoke.

An old chimney lets a better light through than a new one, and a shallow bowl lamp is better for poor grades of oil than a deep bowl lamp.

The 40 Sable Island ponies sold by auction at the Halifax Exhibition realized an average of about $36.50 per head. Prices ranged from $21 to $66. We presume some little boys and girls are having a gay time getting their steeds used to harness.

RED ROSE TEA "is good tea"

Make your FENCEPOSTS ROT-PROOF

DID you know that the ordinarily good fence post which you are accustomed to replacing every four or five years could be made to last 20 years? Creosote treatment does it. And Grade-One Liquid Creosote Oil brings this advantage right to your door because it is creosote in such form that the average home owner and farmer can use it.

Barrett's Grade One LIQUID Creosote Oil

The biggest point about Creosote Oil is that you can apply it by brushing or dipping. No cumbersome, closed-cylinder method. Just as simple as painting. And it penetrates deeper than any other preservative. Stop those costly renewals. Use this wonderful preservative on all wood work exposed to earth or dampness.

Halifax, N. S. St. John, N. B. Sydney, N. S.

VALUE YOURSELF

There are few more unpleasant traits of character than conceit. A conceited person never makes the friends nor enjoys the good opinion that a less self-conscious person does, but at least he is happy himself. There is a being more unfortunate than he—and that is the man or woman who hasn't a proper appreciation of his or her own worth.

In our anxiety lest our children become conceited, many of us run great risk of going to the other extreme and making them too self-depreciatory, especially if they chance to be inclined a little that way naturally.

A young girl of my acquaintance was brought up by parents who had a horror of bumptiousness and conceit. Her looks, her manners, and her acquirements were praised sparingly, and always the praise was qualified with suc hremarks as "If you act as well as you look you'll do well enough." Secretly they were very proud of her, but she didn't realize it until she was a woman grown—and then she considered it simply the natural pride every parent feels in a normal child, and felt that she did not deserve it at all.

Her poor opinion of herself worked against her in her everyday life, leading her to think, if any difference of opinion arose between her and others, that of course she must be the one who was wrong. It threatened to lead her into marriage with an inferior, because she didn't appreciate her own abilities and possibilities, and it was simply chance—or Providence—which interposed between her an dthe wreck of a life.

Her parents had worked for the very best, but they had failed to allow for a morbid, self-depreciatory strain that ran in her blood, and the result is a woman who all her life long will be hampered by the feeling that she does not amount to much, anyway.

Mothers, if your daughter is pretty, tell her so; but show her that beauty is not the highest gift a woman can receive. If she is bright and capable, tell her so; but lead her to see that these qualities need to be combined with modesty and discretion if they are to be real advantages. Help her to appreciate her own good points, as well as warn her of her faults, and then when the time comes that she must stand alone and make choice herself she will not have a paralyzing sense of inefficiency to hamper her.

A conceited person may not be so agreeable to live with, but he will accomplish more in life, and do it easier, than the one who works in that saddest of mental atmospheres, that of self-recognized inferiority, of timidity, of self-depreciation. Whether this state of mind is correct or not, it is just as bad for the victim as if it were true. Start your girls and boys out with courage, mothers! The yneed every bit they can get.—Ellen Trayne.

PILES CURED at HOME by NEW Absorption Method

TRY IT

A handful of hops in the brine in which hams and bacon are pickled adds to the flavor of the meat and keeps the brine sweet.

To clean a sewing machine. cover all the bearings with kerosene, run the machine rapidly a few minutes, then with a soft cloth remove all the kerosene and apply machine oil.

Wash silver that is not in daily use in soapy water, wipe, and dry a few minutes in a warm oven, then wrap in tissue paper. Do not allow one piece to touch another. Place tissue paper between. Put the teaspoons and other small pieces in a quart can and hermetically seal. Put the knives. forks, and tablespoons in a two-quart can. They will not tarnish. and will require no polishing when wanted for use.

Keep a box of powdered borax near the work table. Add a little to the water in which the dish towels and dish cloths are washed. They will wash easier, keep sweet longer, and the borax will aid in keeping the hands soft.

To remove iron-rust spots, in the absence of sunshine, soap them well, place a wet cloth on a very hot iron; when the steam rises lay the spots on the cloth and immediately rub with a crystal of oxalic acid, or a damp cloth dipped in powdered crystals. When the spots have disappeared. wash at once in several waters. Guard the acid well, as it is a deadly poison.

Use carron oil for burns. It is made of equal parts of lime water and linseed oil. Drop a quantity of stone lime into water. stir well. let settle and pour off the top. When mixed with the oil, shake well before applying.

Put a tiny bottle of flaxseed in the traveling bag. Should a cinder be blown into the eye a flaxseed will soon find it, and may save a great deal of pain and an inflamed eye.

A two-quart can of boiling water is an excellent foot warmer if encased in a little flannel bag. It can be rolled about easily. and is of easy application where dry heat is to be used to relieve pain.

Brighten the colors in a carpet by sweeping it with a broom dipped in salt and water, shaking well to remove all surplus water. The broom should be damp, not wet. Use damp earth to remove the dust when carpets are lifted.

Before broiling steak open all the draughts to make the coals bright and clear. Hold the meat for the first few minutes close to the blowing coals, then turn. This will seal the juices. Then it may be finished at a distance of several inches above the coals. From a broiled steak little or no juice should escape.

Minard's Liniment Co., Limited.

Dear Sirs—I had a Bleeding Tumor on my face for a long time and tried a number of remedies without any good results. I was advised to try MINARD'S LINIMENT, and after using several bottles it made a complete cure, and it healed all up and disappeared altogether.

DAVID HENDERSON,
Belleisle Station, Kings Co., N. B.,
Sept. 17, 1904.

To every 15 pounds of sausage meat add, with the usual seasoning, a tablespoonful of ginger. It will aid digestion and prevent the unpleasant sensation experienced by many persons after eating highly seasoned meat.

Fruit brought from a cellar to be eaten unpared should be rubber vigorously with a damp cloth to remove the invisible germs or bacteria which flourish in a damp, close atmosphere.

An ounce of carbolic acid in paste will check the ravages of vermin which infest papered walls. A little carbolic acid used in cellar whitewash will prevent the unpleasant flavor that is apt to impregnate milk, meat, and other edibles when kept in a close underground room.

Clean finger marks from painted walls with a damp cloth dipped in whiting. Rub discolorations caused by scratching matches with a cut lemon, followed by the damp cloth dipped in whiting.

Sprinkle coal liberally with salt as it is put into the stove or furnace; it will burn more evenly, last longer, and there will be fewer clinkers.—Sarah E. Wilcox, in Ohio Farmer.

THE ART OF GETTING THINGS DONE

I suppose the art of getting things done, so far as one is personally concerned, depends very much on system and perseverance. There is a homely proverb about the head saving the heels which has a good deal of pith in it. You know how many needless steps may be taken in the course of a morning's baking, for instance. One cook think so feverything which she will require—the spice, the sugar, the butter, the pans, the salt, the sieve, the sundries—and arranges them all on the table in an orderly manner before she begins her mixing and molding. Another has her hands in the dough and remembers that she has not adjusted the oven dampers properly, and that the lard is in the cellar, and the apples are in the barrel, and the milk is in its place. The housekeeper who has no method is obliged to take a half dozen steps for every one which is taken by her orderly friend.

Leaving cooking, and turning to the other kinds of work, we all know women who sometimes see the bottom of the mending basket and occasionally can announce that the family sewing for one while is accomplished and out of the way. I speak less confidently about the sewing problem than any other because it does seem as though a mother's work with the needle is almost endless, let her plan as carefully as she may. Little knees go through the stockings and the trousers so soon; little dresses are so often caught on projecting nails, and little people grow so quickly out of everything that the mother, even when well seconded by a good seamstress, and aided by the flying machine, has still her hands full.

The art of getting things done by other people is quite distinct from, much more difficult, and necessarily much more of a fine art, than that of doing things one's self. Anybody may learn self-government, it would seem. Evidently without it it is useless to attempt directing others.—Christian Globe.

Famous Little No. O Power Mixer

Turns out a batch of thoroughly mixed concrete in less than one minute. Discharges from either side, which other mixers do not do. Also mixes your lime and cement mortar to perfection. Light, durable, highly guaranteed, and has a big reputation. Adapted for a hundred different kinds of jobs. A great money saver. Write for our special offer.

DRINK WATER FOR TONIC AND YOU WILL BE HAPPY

Water taken as a tonic assures a happy disposition, a clear complexion, a good appetite, and a liberal amount of "pep," in the opinion of Dr. R. T. Nichols, physician in the Kansas State Agricultural College.

"The average person does not drink enough water," says Dr. Nichols. "Water may be taken at any time by the average person without injury to the system. Old physicians have advised against drinking water at meal times. Their theory was incorrect, as no harm can result, provided one does not wash down the food.

"Water stimulates the kidneys, the bowels, and the pores of the skin. A good digestive system is almost an assurance of perfect health. Pure water is a tonic for this system, and moreover it is the best tonic a person can take.

"Ice water should not be rdunk by the healthy person no matter how hot the day, for its temperature is too far below that of the body. An athlete should not drink water just before or after a contest. Water taken on an empty stomach cleans out the digestive tract and prepares these organs better to digest the food.

"There is such a thing as taking too much of nature's tonic. An excess of water overworks the excretory organs just as does an overdose of prepared tonic.

"The source of tonic water should be tested several times a year. Although water is the best of tonics, it may carry the worst of germs. Always be sure drinking water is pure."

THE COZY CORNER

The farmhouse is not complete without at least two cozy corners. One inside, and a comfortable place to sit and rest and get the fresh air in summer and sunshine in winter months.

I never realized what comfort could be had with an inclosed porch till my porch facing the south was encased with glass sash. It made a cozy corner at one end that is both inviting and restful after a long day.

For the winter corner I ran a partition across the porch, which made a room enclosed with glass sash. A small stove that does not consume over a ton of coal a season keeps the room very comfortable. Besides, I have plants set on a shelf round the two sides. It makes an ideal sewing room. Several comfortable rockers and a couch and a reading table furnish the apartment nicely.

For the very [illegible] I have a corner of the living room over near the sunshiny windows arranged so any of the chairs can be used for comfort and ease. The table contains all varieties of reading matter and my sewing basket. Life is one sweet song since the advent of the cozy corners. Try it.—

Hot Water When You Need It.

WHAT a blessing always to have hot water quickly when wanted. The special damper under the Kootenay's polished copper reservoir lets in plenty of heat, giving abundance in a jiffy. But why waste heat when you do not need warm water? The handy damper takes care of that, too. Just another instance of Kootenay Economy and efficiency worth knowing more about.

The wash-boiler can be set the long way of the range, if you wish, leaving two of the hot, front holes free for cooking. Wash-day dinners can be just as good as on other days.

McClary's Kootenay Range

You can learn why Kootenay Ranges stay good as new, long after other ranges have to be repaired or replaced,—how the asbestos joints prevent leakage of air or drafts at joints, how the aluminized flues prevent rust. These things are all fully explained in an interesting little booklet. You may have yours by sending the coupon to the factory.

EDWARDSBURG GLUTEN FEED

23% PROTEIN GUARANTEED

The Feed for More Milk

This Gluten Feed enables you to feed the cows a properly balanced ration, containing all the Protein they will eat and digest and turn into milk.

We have a book about it. Write for a copy—and learn how many farmers and dairymen are feeding for more milk—and making it pay.

—Fatten Hogs on Edwardsburg Oil Cake. 804

THE CANADA STARCH CO., LIMITED - - MONTREAL

THE HALIFAX EXHIBITION

(Continued from page 781)

Next to Miss La Honda stood Cobequid Helbon Nellie, a cow that gave 84 lbs. milk in one day when four years old. Further down the line was Harding's Shade Lawn Olinda II, first in her class at all Quebec Province exhibitions and grand champion at Quebec. The fourth prize cow was Dickie's Mercena Artalissa, the champion of the Amherst dairy test in 1913.

Two of Dickie's cows sandwiched a Lea cow in the aged cows in milk class.

Lea led the way in the three-year-old cow class with Princess Posch Rooker, although she has been milking since January.

Lea's Ida Rooker's II Vale was first with three of his get, and the sire of the best four animals get of one sire.

Lea's Island Mary was first with two of her progeny.

The best three animals, progeny of one cow, were out of Lea's Aggie Daisy De Kol.

Dickie captured the red ribbon on aged herd, and Harding ran away with similar honors on breeders' young herd.

We doubt if so many high producing Holstein cows ever stood together at any previous Maritime Province show.

Dairy Grades

were few in number, but of good quality. See list of prize winners elsewhere in this issue.

SHEEP

There was a strong showing of well-fitted sheep. A glance at the published list of awards will show who is who as breeders of the respective breeds. There were over 225 head of the best sheep in the Maritime Provinces, and the majority of them were ideals of their respective classes.

SWINE

The showing in the swine classes was rather small this year. Fifty head was all the various breeders mustered. There was a fair showing of Berkshires, Chesters, and Durocs. Yorkshires had only two or three representatives.

Prof. Day, of the O. A. C., Guelph, placed the awards in the sheep and swine classes.

PRIZE WINNERS AT THE HALIFAX EXHIBITION

(Continued from page 785)

Female and 2 of her progeny—1, W. M. Lea.

Aged Herd—1, S. Dickie & Son; 2, W. M. Lea; 3, Harding Bros.

Breeders' Young Herd—1, Harding Bros.; 2, W. M. Lea.

Champion Bull—W. M. Lea.

Champion Female—S. Dickie & Son.

Holstein Specials

Four Animals, the get of one sire—1, W. M. Lea; 2, Harding Bros.; 3, S. Dickie & Son.

Three Animals, the progeny of one cow—1, W. M. Lea; 2, Harding Bros.; 3, S. Dickie & Son.

Grade Jerseys and Guernseys

Cow, 4 years old—1, Mrs. Robert Thompson, Halifax; 2, Allison McDonald.

Cow, 3 years old—1, Allison McDonald.

Heifer, 2 years old—1, Robt. Thompson; 2, Allison McDonald; 3, Thos. Latham.

Heifer, senior yearling—1 and 2, Allison McDonald.

Heifer, calf—1 and 2, Allison McDonald; 3, Thos. Latham.

Herd—1, Allison McDonald.

Cow and 3 of her progeny—1, Allison McDonald.

Grade Holsteins and Ayrshires

Cow, 4 years old—1, Prescott Blanchard; 2, W. M. Lea; 3, Allison McDonald.

Cow, 3 years old—1, W. M. Lea; 2 and 4, Prescott Blanchard; 3, Allison McDonald.

Heifer, 2 years old—1, W. M. Lea; 2, Prescott Blanchard; 3, Allison McDonald.

Heifer, yearling—1, W. M. Lea; 2 and 3, Allison McDonald.

Heifer, calf—1 and 3, John Retson; 2, P. Blanchard; 4 and 5, Allison McDonald.

Herd—1, Prescott Blanchard; 2, W. M. Lea.

SWINE

Berkshires

Boar, over 1 year—1, J. R. Semple, Tatamagouche; 2, McFarlane Bros.; 3, A. C. Sarvant, Overton.

Boar, over 6 months—1, McFarlane Bros.

Boar, over 3 months—1, A. C. Sarvant; 2, S. B. Semple, Tatamagouche.

Sow, over 2 years—1, J. R. Semple; 2, McFarlane Bros.; 3, A. C. Sarvant.

Sow, over 1 year—1, A. C. Sarvant.

Sow, over 6 months—1, S. B. Semple; 2, J. R. Semple; 3, A. C. Sarvant.

Sow, over 3 months—1 and 2, A. C. Sarvant; 3, McFarlane Bros.

Breeding Sow, with litter—1, S. B. Semple.

Herd—1, A. C. Sarvant; 2, J. R. Semple; 3, S. B. Semple.

Yorkshires

Boar, over 6 months—1, E. C. Griffin, Port Williams.

Sow, over 3 months—1 and 2, Roper Bros.

White Chesters

Board, over 2 years—1, Howard Corning.

Boar, over 1 year—1, Jas. Nichollson, Halifax; 2, Howard Corning.

Boar, over 3 months—1, Jas. Nichollson.

Sow, over 2 years—1, 2, and 3, H. Corning.

Sow, over 1 year—1 and 2, H. Corning.

Sow, over 6 months—1, H. Corning.

Sow, over 3 months—1, H. Corning.

Breeding Sow with litter—1, H. Corning.

Herd—1 and 2, H. Corning.

Duroc Jersey

All prizes awarded in this class were captured by J. E. Baker & Son, Barronsfield.

Grades

Sow, over 2 years—1, A. C. Sarvant.

Sow, over 1 year—1, Allison McDonald.

Bacon Hogs

Best Pen, 2 hogs for export—1, Roper Bros.; 2, A. C. Sarvant.

SHEEP

Leicesters

Ram, 2 Shears and over—1, Albert Boswall, Pownal.

Ram, shearling—1, Albert Boswall; 2, S. L. Boswall, Pownal; 3, John Retson, Truro.

Ram, lamb—1, Albert Boswall; 2, S. L. Boswall; 3, John Retson.

Ewe, 2 Shears and over—1, Albert Boswall; 2, John Retson; 3, S. L. Boswall.

Ewe, shearling—1, Albert Boswall; 2, S. L. Boswall; 3, John Retson.

Ewe, lamb—1, John Retson; 2 and 3, Albert Boswall.

Aged Pen—1, A. Boswall; 2, John Retson.

Pen Lambs—1, A. Boswall; 8, John Retson.

Cotswolds

All prizes went to John Tweedy, Emscliffe, P. E. I., without competition.

Lincolns

Ram, 2 years old—1 and 2, Albert Boswall.

Ram, shearling—1, Albert Boswall.

Ram, lamb—1 and 2, Albert Boswall; 3, C. W. Pugsley, River Herbert.

Ewe, 2 years old—1 and 2, Albert Boswall; 3, C. W. Pugsley.

Ewe, shearling—1 and 3, Albert Boswall; 2, C. W. Pugsley.

Ewe, lamb—1, Albert Boswall; 2 and 3, C. W. Pugsley.

Aged Pen—1 and 3, Albert Boswall; 2, C. W. Pugsley.

Pen Lambs—1, Albert Boswall; 2, C. W. Pugsley.

Weight Versus GAS

TO offset the high price of gasoline, the best engineering talent in the world has perfected light-weight steels and scientific body construction

Despite its scarcity, aluminum is largely used. Weight reduction has been accomplished in every part of the car except the top.

All that is needed in a good top is found in

DU PONT FABRIKOID
RAYNTITE
Single Texture Topping

It is guaranteed one year against leakage. No top has a finer appearance, and although light in weight, it has the required strength and is made to last as long as the car.

Specify RAYNTITE Single Texture Topping for your 1917 car or re-top your auto with this guaranteed, light-weight, long service top material

Ask for free booklet "The Top Question" and samples of Rayntite Topping.

A MIRACULOUS CURE OF CHOLERA INFANTUM By DR. FOWLER'S EXTRACT of WILD STRAWBERRY.

Cholera Infantum is one of the most common summer complaints of infants, and many die who could be saved if properly looked after on the first sign of the trouble.

It begins with a profuse diarrhoea very often accompanied by vomiting and the matter ejected from the stomach has a bilious appearance. The child rapidly loses flesh and becomes weak and languid.

On the first sign of cholera infantum Dr. Fowler's Extract of Wild Strawberry should be administered, and thus check the diarrhoea before it becomes serious.

"Dr. Fowler's" has been on the market for the past seventy years, so you are not experimenting with some new and untried remedy when you use it, but be sure and get "Dr. Fowler's" when you ask for it.

Mrs. B. A. Cirwell, Rossway, N.S., writes: "I can recommend Dr. Fowler's Extract of Wild Strawberry most highly. A friend of mine had a little daughter who was ill with cholera infantum, and was given up by the doctors. The little one's mother asked me to come in and see the child. I told her I had a bottle of "Dr. Fowler's," and asked her if she would try it. When the bottle was half used the child was well. This cure was a miraculous one, for I thought the child was dying at the time."

The genuine Dr. Fowler's Extract of Wild Strawberry is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Price, 35 cents.

FILLING GULLIES

I believe I have something of interest to your readers, and trust that you will be able to spare space for the following:

In June, 1914, I was clearing some land for a farmer in Miegs County, Tennessee. In plain sight of his place, on the top of a hill, stood a nice six-room house. Running in all directions down the hill were big red gullies.

I inquired the name of the owner of the place from the party for whom I was then workin, and then called on her to suggest a practical and economical way of filling the gullies. I told her I could level the land by using dynamite; that I would guarantee satisfaction.

We soon agreed on a price, and I put two men at work. There were fifteen acres in the field, and fully three-fourths of it was more or less badly gullied. One of them was 500 feet long, running obliquely down the hill, and averaged 6 feet in depth. The rest were of smaller size, but ran in almost every direction down the hill.

My method was as follows: A line of bore holes was put down a little way back from the edge of the gully. Each hole was then loaded with a low grade of dynamite, the charges connected up in the shape of a blasting circuit, and fired electrically. The blast pushed the soil over into the gully, which filled it sufficiently to permit of the use of plows to continue the work of leveling.

This work left the dirt in the fills softer than on the intervening ground that had not been disturbed. It would have been better if this other ground could have been subsoiled by the use of small charges of dynamite spaced ten or fifteen feet apart, so as to break up the hardpan and make all ground on the plot equally capable of absorbing rainfall. As the lady was a poor widow and could not afford this expense, this was not done.

The entire cost of the work to her was $85.00. This does not include the plowing, which was done by a relative, and for which no charge was made.

The fifteen acres were planted to wheat at a total cost of $17.50. The threshing and harvesting were also done by a relative with no cost to the owner. The yield was twenty bushels of wheat per acre, and was sold for $308.00. Her cleared gain on one season's crop as a result of the work I did for her was $205.50.

This year the land is in grass, of which there is a very fine stand.

As there is a good deal of gullied land in the south that could be reclaimed at small expense by the method described above, I thought your readers would like to know about it. If any one doubt the truth of this story, I am prepared to give the names and addresses of twelve leading men in Meigs County, who are themselves owners of large river farms, and who will vouch for what I say.—J. E. Hall, St. Elmo, Tenn.

PREVENTING DAMAGE FROM FRESHETS

A good deal of damage is done every spring by freshets. This is due partly to the narrowness of creeks and ditches which haven't sufficient capacity to carry off the abnormal flow of water temporarily poured into them.

Widening these creeks and ditches is hard work for which it is difficult to employ labor. Recently I have been experimenting with a method of doing this work and which I have found to be the cheapest and quickest method I have ever heard of. I get right into the creek or ditch and punch holes sloping slightly downward into or under the banks. These holes are about two and a half or three feet down and about 24 inches apart. In each hole I load a cartridge of sixty per cent straight dynamite which is well tamped in. I use a cap only in the center hole, as the soil, being thoroughly saturated, will transmit the explosion down the line from hole to hole.

A blast like this under the banks will break down a large amount of earth, most of which slides down into the creek or ditch. The first freshet that comes along completes the work by washing these deposits down the stream. Of course this method is practicable only when there is considerable flow of water.

I thought your readers who are troubled with freshets might like to know about this method, as the work takes very little time and the cost of the explosives is very small compared to the damage the freshet would do, and little compared to what labor would cost to widen the creek or stream in any other way.—M. C. Potter, Bellevue, Iowa.

CAUSE AND CURE FOR BLOAT

Bloat is a common derangement in cattle, and every year causes the death of many animals. Green, succulent grass in the spring or late in the fall is likely to cause more or less bloat in cattle. The most dangerous bloat is that caused by eating clover when it is wet, either with dew or rain. Trouble can nearly always be prevented by feeding some dry food to cattle before turning them out on soft, succulent grass, and never turning cattle or horses on wet, gree nclover, especially second growth clover. This kind of food, even if the animal does not eat too much of it, will often cause bloat. It is very likely to undergo rapid fermentation, causing a large quantity of gas in the rumen, which results in great distention in a few minutes, pressing the contents of the abdomen against the lungs, causing suffocation and death.

There are two kinds of bloat. One is where the animal may be badly swollen but not in a condition likely to cause death quickly. In such a case the animal will be swollen tight and may make a moaning sound every time it breathes. If made to move it will grunt, but does not show great distress. The treatment in this case is to give two ounces aromatic spirits ammonia at a dose i na pint of cold water every half hour until the swelling goes down, which it will likely do after the first or second dose. If aromatic spirits of ammonia is not on hand, give two tablespoonfuls each of baking soda and ground ginger mixed in a pint of water, and repeat in half an hour if not relieved.

In dangerous bloat the animal is greatly swollen, the back is arched, the mouth is open, and the tongue protrudes from the mouth, and there is a passing of feces and urine every few minutes. In this case if the animal is not relieved at once it will die in a few minutes. As there is not time to give medicine, the operation of tapping should be performed at once. The best instrument for this operation is a trochar and canula, but the farmer might not have one, and if he had there would not be time to go from the field to get it.

In such a case a pocket knife should be used and an opening made on the left side, one hand's breadth in front of the haunch and the same distance down from the spines of the vertebra. The opening made with the knife should be large enough to admit the finger as soon as the knife is drawn out, for if this is not done little of the gas will get out. There is no danger in making an opening in this part of the rumen, or paunch, as it is so often called, so one should not hesitate until it is too late to save the life of the animal. There is no after treatment needed, as the wound soon heals.—Dr. Donald McIntosh, Illinois.

DIEU ET MON DROIT

DEPARTMENT OF THE NAVAL SERVICE.

NOTICE OF SALE

SEALED TENDERS, address d to the undersigned, w ll be received up to noon of the 1st October, 1916, for the purchase of the

Dog-Fish Fertilizer

to be produced at the Dog-Fish Reduction Works at Canso, N. S., and Clark's Harbor, N.S., during the season of 1916 The total quantity that will be produced is estimated at betw en 150 and 200 tons of 2,000 pounds

No particular form is necessary for use in tendering, but envelopes should be distinctly marked across the face, "Tenders for Dog-Fish Fertilizer."

The fertilizer will be put up in bags of 100 pounds each, and a charge of 15 cents will be made for each bag, additional to the price paid for the fertilizer.

Consistent with the price offered, tenders from bona fide agriculturists will receive first consideration; the right is reserved, however, to reject any or all tenders.

Tenders from non-residents of the provinces of Nova Scotia, New Brunswick and Prince Edward Island will not be considered and guarantees must be given that the fertil z r will not be disposed of or used outside of these provinces.

Tenders should state the quantity required in bags, and the minimum quantity acceptable at the price offered, and from which point it is desired shipment should be made The price offered should be on the basis of so much per 100 pounds.

Terms of s le are cash within ten (10) days of acceptance of tender fo specific quantities, all charges for transportation from Works to be borne by the purchaser Failure to remit within the time specified will result in the cancellation of tender without further notice, and the allotment being diverted to the next highest tender, or such other as may be in order.

Remittances should be made payable at par to the Department of the Naval Service at Ottawa. Bank cheques will not be accepted unless certified.

G. J. DESBARATS,
Deputy Minister of the Naval Service.
Department of the Naval Service,
Ottawa, August 28, 1916
Unauthorized publication of this advertisement will not be paid for.

Isn't he a

Fine Child?

What every Mother should know

Every mother should know that Dr. Cassell's Tablets are just as suitable for children as they are for grown-up people. Their splendid nutritive and vitalising properties soon overcome any tendency to nervousness or weakness in the little ones, and lay the foundation of a strong constitution for after years. They make weakly children thrive.

Dr. Cassell's Tablets should be given to all children who are in any way delicate, fretful, or of weakly build. The results will be improved assimilation, a well-nourished frame, and bright, happy child health. There is no difficulty in getting children to take Dr. Cassell's Tablets. Full directions and dosage are given with each packet.

Dr. Chas. Botwood, D.Sc., Ph.D., &c., an English Scientist, says —"As a safe and reliable remedy for loss of flesh and vigour, nerve affections, and bodily weakness, Dr. Cassell's Tablets appear to be unique. I have no hesitation in recommending them for young or old."

Dr. Cassell's Tablets

Dr. Cassell's Tablets are Nutritive, Restorative, Alterative, and Anti-spasmodic, and the recognised remedy for

Nervousness	Sleeplessness	Dyspepsia
Nervous Breakdown	Anæmia	Palpitation
Neurasthenia	Malnutrition	Kidney Trouble

Specially valuable to nursing mothers and women of middle life.

Sold by Druggists and Storekeepers throughout Canada. Prices: One tube 50 cents, six tubes for the price of five. War tax 2 cents per tube extra.

Free Sample On receipt of 5 cents to cover mailing and packing, a generous free sample will be sent at once. Address: Harold F. Ritchie & Co., Ltd., 10, McCaul Street, Toronto.

Sole Proprietors: Dr. Cassell's Co. Ltd., Manchester, Eng.

AVERAGE VALUE OF FARMS IN CANADA

According to late figures from the Bureau of Census and Statistics of Ottawa, $38.90 is the estimated average value per acre of farms in Canada. These figures include all lands used for agricultural purposes of any kind, improved or unimproved, and the value of houses, barns, and other farm buildings. The average value per acre as thus estimated is as follows for each province: British Columbia, $125; Ontario, $52.49; Quebec, $51.36; Prince Edward Island, $37.64; Manitoba, $30.36; Nova Scotia, $28; Saskatchewan, $24.20; Alberta, $23.15; New Brunswick, $22.48.

The comparatively high values in Ontario and Quebec are probably due to intensive and well-developed farming, especially in the southern sections, where seasons are more favoralbe than in many other provinces, while the exceptionally high figure attained by British Columbia is said to be the result of the flourishing condition of fruit raising there. New Brunswick's low figure is chiefly due to the fact that, while large tracts are statistically treated as farms, in many cases these are more or less neglected beyond superficial cultivation, and to the further fact that its people have largely depended upon lumbering for their livelihood.

THE RETIRED FARMER

It has been the popular thing for some time to knock on the retired farmer. To quote some people, "the retired farmer is the meanest, stingiest piece of kiln-dried humanity that every bothered the good people of this country." Some if that may be true of the farmers who leave the farm to go to the city. I know none of that sort. It is certainly not generally true of a farmer that retires to his community town, where with a cow, a garden, some chickens, and an auto he finds exercise and contentment. Such men are called a drawback on the community, yet in my neighboring town a group of retired farmers by petition started a new sewer district for their neighborhood though opposed by some residents of that section.

One of the biggst, most unselfish men I know of is a retired farmer in central Iowa. Content with his little "farm" and his church work, located where he can watch and counsel his children, this grand old man is a tower of strength in his community. There are retired farmers whose vision of life is small. The same is true of some retired buiness men of any kind. But as long as there are among retired farmers men like the one mentioned it is the height of foolishness to condemn all.—Geo. W. Godfrey, Iowa.

COMPOSITION OF TURNIPS

According to the result of analysis, the bulb of the turnip or swede is not uniform in composition, and it is generally supposed that the part of the bulk which is covered by the soil is richer than the part which is above the soil. The investigations show that this assumption is incorrect and that—

1. The upper half of a turnip contains a higher percentage of dry matter than the lower half. This is in direct opposition to the common opinion that the lower half is the richer.

2. The outside part next the rind is richer in dry matter than the inner part. As we proceed from the outside towards the centre the dry matter decreases. This is true no matter in what direction we proceed, but the difference from the crown to centre is greater than the difference found in any other direction.

It is well known that individual roots of the same species grown on the same land side by side vary considerably in composition. Generally speaking, large bulbs are lower in dry matter than small ones, but both large and small vary very much among themselves.

Saves Shortening

One of the first things you notice, after "Beaver" Flour comes to your house, is that you are using *less shortening* than you used with western spring wheat flours.

You also notice that the Pie Crusts, Cookies and Doughnuts are lighter and flakier—that the Bread Rolls and Biscuits have a delicate flavour, a delightful, nutlike, homey flavour that is doubly welcome after the tough, almost tasteless bread you used to make with western spring wheat flours.

BEAVER FLOUR

Milled of Blended Wheat

is really two flours in one, for two kinds of wheat are used in blending. "Beaver" Flour contains the choicest Ontario winter wheat, strengthened with western spring wheat.

This gives you the finest pastry flour that can be milled—with the right strength to make a good size loaf of bread or a big pan of snowy Rolls.

More than that, everything made of "Beaver" Flour has a deliciously appetizing, nutlike flavour that is entirely lacking in the strong, western spring wheat flours.

Try it yourself—see how you save shortening—see how you come to depend on the even strength and quality of this famous flour—see how everything tastes so much better. Your dealer should have "Beaver" Flour—or will get it for you.

DEALERS—write for prices on Feed, Coarse Grains and Cereals. 199

THE T. H. TAYLOR CO. LIMITED, - - CHATHAM, Ont.

MOSQUITO NUISANCE

The residents of West Haddonfield were for years pestered and tormented by mosquitoes which, it was learned, upon investigation, were propagated in stagnant pools between the railroad and Haddon Avenue. It was found practically impossible to drain these to the street gutters, hence another method had to be employed, and it was decided to sink the water into the ground. Under the supervision of L. Z. Lawrence a heavy charge of dynamite was sunk and discharged about twenty feet under the surface. This caused the pools to disappear in short order, and no water has accumulated at this point up to the end of the year.

It might help other infested places if the above method was tried.

FALL AS A TIME TO PAINT

A great deal of painting is done in the spring and early summer, principally because people like to have their buildings look well at the season when they can be out of doors and when nature gives a freshly painted building a most beautiful setting. It should be remembered, however, that there are advantages to fall painting.

At this season of the year buildings are usually thoroughly dry. When the pores of wood are filled with water, or have only dried out at the surfaee, the the oil in the paint cannot enter. The paint seals up a certain amount of moisture in the wood and thus does not accomplish what it should by way of preservation. With dry wood the pores are open and empty to receive the oil, and thus most effectively preserve the wood.

There is less danger of having the paint washed and spotted by rains, and flies and gnats are gone.

CANADA'S SUGAR BEET PRODUCTION

It is estimated by the Canadian Census and Statistics Office that 18,000 acres were devoted to the growing of sugar beet roots in Canada in 1915, all in the Province of Ontario, for the manufacture of beet sugar, as compared with 12,100 acres in 1914. The total estimated yield of roots in 1915 was 141,000 tons, compared with 108,600 tons in 1914, the average yield per acre being 7.83 tons, compared with 8.98 tons in 1914. At an average price of $5.50 per ton, the total value of the crop in 1915 was $775,500, compared with $5.00 per ton and a total value of $651,000 in 1914. The production of refined sugar made from Canadian sugar beets grown in 1915 was returned as $36,838,267 pounds, compared with 27,345,248 pounds in 1914, and 23,964,272 pounds in 1913.

LIMESTONE APPLICATION

"My soil is acid and I wish to apply ground limestone. At what rate per acre had I best use it?"—E. L. T.

The amount of ground limestone which should be applied to the acre depends upon the degree of the acidity in the soil. If the soil is very acid, four tons of the limestone will be none too much, while from one to two tons will be sufficient if the soil is only slightly acid.

If a curtain or portiere pole is rubbed with hard soap before being put up, the draperies will slip on easily.

PRIZE WINNERS AT THE HALIFAX EXHIBITION

Hard-Hitting Big Game Cartridges

are the only sure kind to make your hunting trip the success you expect it to be. Velocity and accuracy are the two important features in big game ammunition.

Dominion Cartridges

embody fully these requirements and supplement them with the reliability that comes from high quality materials, skillful workmanship and careful testing.

A sensitive primer that flashes deep into the powder gives instant response to trigger and aim and makes Dominion the high-power ammunition for caribou, moose, bear, deer and all Canadian big game.

A sure "hit and stop" is loaded into each cartridge to back up the sportman's aim. No matter what the shooting conditions Dominion Cartridges meet the requirements.

Write today for our attractive picture "A Chip of the Old Block."

Dominion Cartridge Co., Limited,

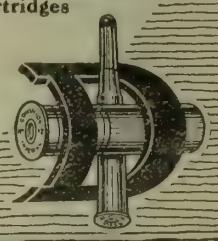
Dominion—the only Canadian-made ammunition.



THE CHARLOTTE COUNTY EXHIBITION

A Maritime Farmer representative visited the Charlotte County Exhibition at St. Stephen last week. Having to leave for Halifax before the judging was completed, he was unable to procure a copy of the prize winners' lists in time for publication in this issue of The Maritime Farmer.

Thousands of visitors thronged the fair grounds. The main building contained exhibits made by the leading dealers in the border town, but perhaps the outstanding feature of this building was the interesting exhibit of vegetables grown with Dominion fertilizers which are manufactured in the town of St. Stephen. Mr. Frank Hunter, the genial traveller for this enterprising firm, was kept busy showing the various exhibits to interested farmers and explaining the composition of the various samples of fertilizers he had at the fair.

The agricultural products display was not, in point of quantity, up to that of some former Charlottetown County exhibitions. There was, however, a very creditable display.

Fruit made a good showing, as also did aipiary products.

There was a particularly good entry of butter in crocks, prints, and in the granular form. Mr. McDougall, who judged this section, was delighted with the improvement in the quality of butter made in the Charlotte County dairies.

The women's department, both in needlework and in the culinary sections, were, as usual, up to a high standard of perfection. There was also a very attractive display of flowers.

The poultry show was rather small this year. The cattle and horses were hardly up to last year. The cattle were brought in in ordinary field fit. A little improvement along this line would very materially help to make a more attractive show.

There was a fair showing of sheep. The entry in the swine classes was not up to that of last year. Mr. Thos. McDonald, who showed such a well-fitted pair last year, was on hand again this year with another good pair. His were really the only pair of hogs deserving of the title exhibition hogs at the fair.

SUBSTITUTIN PEPSIN FOR RENNET

Since the outbreak of the war the Dominion dairy branch has been urging the cheese makers of Canada to secure raw rennets from farmers and butchers in their own localities, as was the practice in the early days of the cheese making industry. This course seemed advisable for the reason that the supply of such material has been secured chiefly in recent years from those central European countries with whom we are now at war.

Only a limited quantity of rennets (calves' stomachs) have been secured, and the cheese factories are now faced with a possible shortage, and exceedingly high prices for rennet extract in any case.

Pepsin

It has been known for some time that pepsin, in its various forms, has the property of coagulating milk, as rennet does, but its cost compared with the normal cost of rennet extract having been prohibitive it has not been used for experimental purposes.

The recent excessive advance in the price of rennet extract alters the situation, and the use of pepsin would now be a commercial advantage in point of cost.

Tests at Finch Dairy Station

To help meet the situation tests have been conducted at the Finch Dairy Station with a view of determining if pepsin may be safely used as a temporary substitute or partial substitute for rennet.

A number of cheese were made by Mr. George Barr and F. J. Singleton, using pepsin as a coagulant. These were examined on June 7 by the experts of the Dairy Division, Prof. Dean, Frank Herns, G. G. Publow, L. A. Zufelt, E. Bourbeau, Geo. Hodge, and others. In each test there were two cheese made, one of which was "set" with rennet and the other with pepsin. In every case but one the judges awarded first place to the cheese made with rennet, but the difference was very slight and chiefly in the matter of texture, which was a little smoother in the cheese made with rennet.

It was the unanimous opinion, however, that it would be safe to recommend the use of pepsin in cases where no rennet can be obtained, or to eke out a limited supply, by using a mixture of rennet and pepsin. Prof. Dean reported that tests made at Guelph in which a mixture of rennet and pepsin was used gave rather better results than pepsin alone. This practice is recommended where it is possible.

In the light of the foregoing results the option on a quantity of pepsin, which was secured by direction of the Minister of Agriculture some time ago, was at once taken up, and it is expecte dthat this supply will be available in the course of a few days for distribution to cheese factories that submit reasonable proof of being actually short of rennet and unable to secure a further supply. Distribution will be made only in lots of 1 to 5 pounds at a time. One pound of pepsin is equal to a little more than one gallon of standard rennet extract.

Application for pepsin must be made on cmfwypaoincmfwypaoincm comb b

Directions for Using Pepsin

Two drachms of soluble powdered pepsin (1 to 3,000 test) are sufficient to coagulate 1,000 pounds of milk. If a suitable scale is available the required quantity may be weighed, but for convenience and to save the ex-

pense of a scale we have devised a measure which holds two drachms when level full, to distribute with the pepsin.

To Dissolve the Pepsin

Dissolve the pepsin in water in the proportion of three ounces of water for each two drachms, or measure, of pepsin, using preferably a round-bottomed cup or bowl as a container. The water must be at a temperature of 105 degrees F. When the water is added it must be stirred immediately and continuously or it will become a sticky mass very difficult to dissolve. After being thoroughly stirred it is well to pour the liquid from one vessel to another to see that there is no undissolved pepsin adhering to the vessel.

It is a good plan to add at first only enough of the water to make a creamy paste. Stir until smooth, and then add the full amount of water. A few drops of hydrochloric acid added to the water helps to dissolve the pepsin.

To Use

Dilute the above in the same quantity of water as is used with rennet extract before adding it to the milk.

It is advisable to dissolve the pepsin at least half an hour before using.

The acidity and temperature of the milk should be the same as when rennet extract is used.

If rennet extract is available it is recommended to use half the usual quantity with half the above quantity of pepsin, mixing the pepsin solution with the rennet extract before diluting with water.

WATERY FOOD AND PRODUCTION OF MILK

According to experiments, it has been found the increased consumption of foods containing a large quantity of moisture has no effect on the milk yield, and the average composition of the milk produced fro mwatery food did not differ from that produced from dry food. No support was obtained for the contention that watery foods give a poorer milk than dry foods. The increased consumption of water when watery foods were being used caused no change in the milk, and did not influence the yield. Variations were found to exist as regards individual foods—e. g., maize pulp, roots, and lucerne increased the yield, potatoes decreased it somewhat, while pumpkins caused a large decrease.

PROF. BLACK VISITS THE MARITIME PROVINCES

Prof. W. J. Black, successor to the late Dr. C. C. James as commissioner in charge of the fund for agricultural education, is now touring the Maritime Provinces. He spent several days at the Halifax Exhibition; from there he went to Fredericton to confer with the heads of the agricultural departments of New Brunswick. He then visited Sussex and went on to Charlottetown. Prof. Black was a classmate of Prof. Cumings in the O. A. C., Guelph, and for a number of years occupied a prominent place on the staff of the Farmers' Advocate before he assumed the direction of the Monitoba Agricultural College. Prof. Black is closely in touch with agricultural matters in Canada from Montreal to the Pacific coast, and is now getting in touch with the men who are doing things in the east. We wish Prof. Black every success.

HAZARDS IN HANDLING GASOLINE

In connection with investigation regarding safety and efficiency in the use of petroleum and its products, the United States Bureau of Mines has made numerous tests of gasoline. In Technical Paper No. 127, by G. A. Burrell, are stated the hazards that may result from handling these liquids and the precautions to be observed.

Gasoline vapor mingles with the air in the same manner that water vapor does, the amount carried depending upon the temperature of the air and the readiness with which the vapor can be obtained. If one takes the cover off a full pail of tightly enclosed gasoline and applies a match to the surface the gasoline will flare up and burn as long as the gasoline lasts. On the other hand, if one puts a few drops of gasoline in a small, tightly enclosed pail, waits a few minutes, and then produces a flame or electric spark a violent explosion will likely result.

In the first case the vapor burns as fast as it comes from the gasoline and mixes with the oxygen of the air, whereas in the second case the oil vaporizes in the pail and mixes uniformly with the air to form an explosive mixture and upon ignition explodes.

On gallon of gasoline when entirely vaporized produces about 32 cubic feet of vapor. If a lighted match could be applied to pure gasoline vapor in the absence of air, no fire or explosion would result. At ordinary temperature air will hold from 5 to 28 per cent of gasoline vapor, depending upon the grade of gasoline. In 100 parts by volume of air and gasoline an explosion would not take place if there were more than 6 parts of gasoline, or less than 1.4 parts. In other words, the explosive range is between 1.4 and 6 per cent of vapor. One gallon of gasoline can, under ideal conditions, render 2,100 cubic feet of an explosive mixture.—H. J. Wilson, Colorado Agricultural College.

FLAVOR IN FOODS

If food is unpalatable, no matter how suitable it is in other respects, it is badly digested. The greater the relish with which an animal eats its food the greater is the amount of the digestive juices secreted. The palatableness of foods is largely dependent upon the odors or flavors they possess, and these are due to chemical bodies, which, though they do not come into any of the categories mentioned, are nevertheless essential constituents of normal food.

Big Dinners

The bigger the family the greater the need for this new Coal Range with the Handy-height oven. There is an almost unbelievable number of trips to the oven while a big dinner is under way. That is what makes the work so tiring. Constant stooping does *so* weary the back.

And here, to lighten that work is the Lighter Day—the Coal Range with a Handy-height Oven.

A big capacity oven with a Clearview door of glass. You lift the dishes in and out of this oven without bending your back. You watch things baking without opening the door—and without stooping. The thermometer is at standing height too. Everything is contrived to take the last ache out of baking.

And for big dinners! The number of things that can be cooked quickly and kept hot on the Lighter Day Coal Range *would* astound you.

There must be three times the usual warming space. The warming closet over the oven is heated like an auxilliary oven. Below the oven is a large storage closet often used for stowing away pots and pans. This is a famous warming closet when there is a big crowd to cook for. Besides this unusual warming space there is a shelf over the cooking top where plates and dishes may be warmed and kept in readiness for serving.

There are six pot-holes. Four of these are placed in the wide cooking top. Two are fully enclosed to shut in odors of cooking. There need never be an odor of cooking vegetables in the house.

And when dinner is over there is an abundant supply of water on hand to wash up. The reservoir is very large and is kept at boiling heat.

LIGHTER DAY HIGH OVEN COAL RANGE

Where there are many mouths to feed there should be a Lighter Day in the Kitchen. Anyone who would like to know more about this wonderful range should have a copy of our booklet "A Lighter Day in the Kitchen." This is a book made from photos of a housewife actually using the Lighter Day Range. A copy will be sent without charge to anyone using this coupon.

MILBURN'S
HEART and NERVE PILLS
CURED
Salvation Army Captain.

Capt. Wm. E. Sanford (Salvation Army), 38 Earlscourt Ave., Toronto, Ont., writes: "A short time ago I suffered from heart trouble, which seemed to come on me very suddenly. I was so bad, that at times it seemed as if it was all I could do to breathe. I noticed an announcement of Milburn's Heart and Nerve Pills, and decided to give them a trial. After taking two or three days' treatment I felt fine, and my heart has not bothered me since. If this testimony would be of any service to others you are at liberty to use it."

To all who suffer from any form of heart trouble Milburn's Heart and Nerve Pills will give prompt and permanent relief. They strengthen and invigorate the action of the heart, and tone up the whole system.

Milburn's Heart and Nerve Pills are 50 cents per box, or 3 boxes for $1.25. For sale at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

CAVALRY HORSES

"Soldiers who have the management of war horses know how needful it is for them to be gentle and obedient, for a vicious or timid horse might cause no end of trouble in a battle; and this is so thoroughly understood nowadays in training army horses that only kindness is allowed to be used," says Mrs. Florence H. Suckling, in her lecture on "The Horse." "It is rare, indeed, to hear of a vicious trooper, while a soldier who is found beating or bullying his horse is very likely to be summarily reprimanded. This more reasonable and humane management is a saving to the country, as the horses last longer and there are fewer accidents. As soon as a horse is restive inquiries are made into the character of it rider, on the principle of the old maxim: 'Tell me the temper of a trooper's horse and I will tell you the character of the soldier.'"

PRODUCING VEAL

"Will you please tell me how to make the best veals out of Holstein calves? How old should they be to market?"—E. J. M.

To produce the highest grade of veal whole milk comprises the sole feed, and the calves are permitted to suckle their dams. The animals are pushed as rapidly as possible in order to produce a good finish before the flesh begins to toughen. This usually takes from eight to twelve weeks. In a noted veal center of Scotland the younger calves draw the first milk from the cows while the finishing veals get the richer and fatter milk which remains. It is possible to produce veal by using a limited amount of whole milk and substituting grains, etc., but the American market does not make such a course profitable. In matter of fact, only a special and certain market will make it advisable to produce veal by any method.

KEEPING TOOLS SHARP

By sharpening the farm tools himself a farmer can keep them in good serviceable cutting condition, and the special facilities he has for doing the sharpening will soon pay for themselves.

With a broad flat file an old dull rusty scythe can be sharpened in a few minutes by clamping the blade between two boards and drawing the file back and forth over the blade edge. A whetstone may be used to retain the edge on the blade while the scythe is being used. A large file may also be used in sharpening plowshares, discs, knives, etc.

Two grindstones enable a farmer to do better sharpening than where he has but one stone. The grinding or cutting is then done on the stone having a coarse grit, while the sharp edge is put on the blade or tool by using the finer grit stone.

Where the farm is of considerable size, or a farmer has sweep power or engine power he can use emery wheels to better advantage for grinding and sharpening tools than can be obtained by using grindstones or files. By belting or gearing the emery-wheel shaft —which is journaled in an iron base or frame—to the engine pulley or the sweep gear, and having a number of emery wheels of different fineness, a farmer is in a position to sharpen plow shares, discs, scythes, and blades in double-quick time. The inconvenience and delay occasioned by hauling plowshares and discs to town for the smith to sharpen is no small item, especially where the discs are needed at once.

Almost as important as doing the sharpening is the matter of having duplicate blades. The plow may strike a stone and break the share at a time when it is most needed; a scythe blade may snap in mowing tall weeds, so that it can be used only as a cornstalk cutter. A new share or blade will be needed some time, and an extra one on the farm overcomes any delay, or enables two men to work when an extra hand is hired.

Look well to the quality of blades if you wish them to stand much sharpening or withstand breaking under reasonable conditions. Good steel blades are tempered in oil, and of course cost a little more than those not properly tempered or those made from second-grade material. You can buy a jackknife for a shilling or for ten shillings, and you know the difference!

Do not sharpen tools with undue haste, especially on an emery wheel, as they may become overheated. Extreme heat withdraws the temper. Before the blade becomes hot from the friction of sharpening, allow it to stand a minute, then continue sharpening. Dipping the tool in cold water frequently will prevent burning.—Farm Journal.

Defies the Frost King

King Winter is armed with countless millions of ice-hard snow-crystals, driven by the full force of winter winds; his destructive work is aided by rapid changes in temperature, which freeze tiny particles of water in the pores of unprotected woodwork, tearing the wood fibres apart as freezing water splits a wrought-iron pipe. In the course of a long Canadian winter he can cause irreparable damage to an unprotected silo, barn or home. He attacks in vain, however, the building protected with

B-H "ENGLISH" PAINT

The pure white lead (70%) and pure white zinc (30%) which it contains, serve as a thin but effective metallic armor-plate, defying all the forces of natural decay for many years.

The superiority of B-H "English" Paint is due both to the purity of its ingredients and to our special methods of manufacture. These produce a paint, which on account of its smoothness and marvellous fineness, spreads easily and penetrates far into the fibres of the wood.

HOW MUCH WOOL DID YOUR SHEEP CLIP?

It is many a year since it made so much difference as to just how much wool one can get from a sheep's back as right now. The war, together with certain other conditions in the world's wool market, have sent wool prices sky rocketing, and so an added interest attaches to reliable data regarding wool production.

How much wool, in pounds and ounces, will a good farm sheep produce in a year? Ask your neighbors who do not keep sheep, and see how many of them can tell you with an assurance that they are right alongside the mark.

Well, here it is: The Manitoba Agricultural College has a flock composed of three breeds—Oxfords, Shropshires, and Leicesters—all well known and popular farm breeds in the western provinces. There are 49 sheep in the flock, almost all of them pure bred, although that does not necessarily affect the weight of fleece, for a good grade flock might be made to yield as much wool, though perhaps not so uniform in quality or in weight per sheep. The shearing this year, owing to the coolness of the weather during late May and early June, was delayed until about two weeks later than usual, being done on June 8th, 9th, and 10th.

The total weight of wool from 49 sheep was 479 lbs., or an average of 9.77 lbs. per fleece. The three breeds averaged fairly close to same weight per fleece, the Oxfords producing the largest weight per fleece and Shropshires the smallest. An interesting fact is that in all the breeds the shearlings gave heavier fleeces than the mature sheep. Here are the results more in detail:

Oxfords—10 mature pure bred Oxford ewes gave 9.5 lbs. each; 5 shearings averaged 10.3 lbs. each; 1 ram, 16 lbs.; 1 grade Oxford, 11 lbs. Average of Oxford flock, 10.3 lbs. each.

Leicesters—9 mature ewes, 8 lbs. each; 5 shearlings, 10.2 lbs.; 1 ram, 12 lbs. Average of flock, 9.66 lbs.

Shropshires—14 mature ewes, 8.92 lbs. each; 2 shearlings, 9 lbs.; 1 ram, 16 lbs. Average for flock, 9.35 lbs.

An interesting fact in connection with the Leicester flock is that one of the best records among the mature sheep was made by an ewe nine years of age. This is an age to which it is not usually deemed profitable to keep sheep.

PREPARATION OF NOURISHMENT FOR STOCK

The food supplied to animals is digested more or less completely according to the condition in which it is given. The food should, therefore, be supplied in such a form that the great-

er proportion can be assimilated, and for this reason a rational preparation of the food is advisable, both to make it more easily digestible and also to excite the appetite of the animals.

If roots are too big they should be cut up, straw should be chaffed, hard grains should be crushed or soaked, especially if given to old animals whose teeth have lost part of their grinding power.

Foodstuffs of poor quality should be mixed with others of a rich character, and foods having little flavor with others more palatable. For example, if straw it supplied by itself, cattle can digest only one-fourth of the nourishment in it, but if associated with good roots a far larger proportion can be absorbed by the digestive system.

Potatoes should, as a rule, be cooked, as then the saliva can act on them more effectively. It has been found that pigs can digest a third more of the tubers when cooked.

And the daily rations should be varied as far as practicable, not certainly, but in gradations.

NEW BULLETIN ON THE SOW THISTLE

What is the worst weed in Canada today? Opinions of farmers might varv a little between wild oats, Canada thistle, and perennial sow thistle, but it is pretty safe to say that at least 75 per cent of the hands would go up at the words "sow thistle."

The sow thistle is fairly true to name, or at least there is a good deal of the hog nature about it, for when permitted to do so it will crowd out and rob almost everything else that tries to be neighbor to it, even to the Canada thistle, wild oats, or other weeds.

T. J. Harrison, field husbandry professor at Manitoba Agricultural College, has written the most exhaustive bulletin on the "Control of the Sow Thistle" that has yet been put into print in Canada, or possibly in any country. This bulletin is well illustrated, not only with photographs of the weed, but also with pictures showing the agencies by which it is spread, implements to be employed in eradicative tillage, and crops that should be grown on infested lands.

The author deals in detail with the best method of fighting the pest in districts where it is just making its first appearance, and also in those parts of the country where it is as thick as the proverbial "hair on a dog's back."

GETTING OUT WILLOW STUMPS

Willow stumps are mean things to dispose of, as any man who has tried it will testify. To blast them out costs considerable money because of the comparatively large charges of dynamite required.

I want to tell your readers how I "fix" large willow stumps. After the tree is cut down I bore an auger hole into the stump just above the surface of the ground, slanting it a trifle downward. I bore just past the heart. I load from a quarter to a half pound of dynamite into the hole, tamp it in tightly with moist clay, and light the fuse.

This splits it and opens it up so that it is in an ideal condition to dry out. A year later I pour a little kerosene oil over it, and it burns out completely.

The dynamite used in this way, you might say, costs nothing, because to attempt to burn out the stumps without first splitting them up takes more than as much more oil as the dynamite costs, and a great deal more of a man's time is required to attend the fires and keep them going.

I hope this pointer may come in handy to some of our farmer friends having willows to dispose of.—M. C. Potter, Bellevue, Iowa.

EFFECTS OF RUST

It is a proven fact that machinery, where exposed to moisture, rusts out very rapidly. In fact, rust does more damage to the exposed machinery than the work which the implement is called upon to do.

This is a needless waste, however, because rust can practically be overcome by taking the proper care of the machine when not in use.

Farmers could get more than twice as much wear out of most implements if they were housed properly. This alone will not suffice in some climates. A very good way to keep the rust from attacking iron parts exposed to moisture is to coat all the iron with a very cheap oil. This oil should be thick and heavy so that when applied to the iron it will not run off.

This coting of oil will keep all of the moisture away from the iron, and therefore will prevent rust from starting.—W. E. Edmondson, Colorado Agricultural College.

COUCH GRASS

Where the patches are small, hand digging or smothering either with tar paper or with straw or manure is recommended. When fields are badly infested some authorities recommend seeding the field to grass for three or four years, as the roots of the grass tend to work toward the surface and are then more easily pulled out by the harrow. Just as soon as the hay is cut the fied shoud be plowed about four inches deep, then disced and gone over from then on until cold weather sets in with a spring tooth harrow. The spring tooth harrow will do better work than any other implement in bringing the roots to the surface. Next season, if corn or roots be planted and given thorough cultivation all summer, the weeds will be practically all killed. All the plants should be destroyed along the fences; if not, the roots will soon get a hold in the cultivated land.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

FOR SALE.—Four pure bred Southdown Ram Lambs and some good ewes, --JOHN McMULLIN, Georges River, C. B.

FOR SALE.—Two good pure bred Cheviot Ram Lambs from impo ted sire. Write for prices.—WILSON GILLIS, George's River, C. B.

FOR SALE.—Two York Boar Pigs, registered stock, one a year old, the other 6 months old, or will exchange one of them for York Sow.—A E. FERGUSON, Gowan Brae Farm. West Bathurst.

FOR SALE. - Pure bred Jersey Bull, 3 months old, whose dam made 59.7 lbs. butter in June test. Write for prices.—KENNETH EMBLETON, Harvey Station, York Co , N. B.

LADIES TO DO PLAIN AND LIGHT SEWING at home, whole or spare time; good pay; work sent any distance, charges paid. Send stamp for particulars.—NATIONAL MANUFACTURING CO., Montreal.

RESPONSIBLE POSITION WANTED by young married man, thoroughly conversant with live stock and capable of taking full charge of farming operations. For references apply to JAS. EASTON, Amherst, N. S.

FOR SALE—Pure Bred Hampshire Rams, (lambs and yearlings.) This breed makes an excellent cross for mutton and wool with the ordinary medium fleeced ewe. App y early.—LENNOX RAPIER, Lower Woodstock, N. B.

STRAWBERRY PLANTS

For the Spring of 1917 we are listing the following varieties:

Senator Dunlap, Sample, Warfield, Wm. Belt, Arnout, Valeria, Desdemona, Ophelia, Portia, Glen Mary, Buster, Haverland, Kellogg's Prize, Paul Jones, Progressive, Superb.

Our new Catalogue and Price List will be ready about the first of the year, and will be sent free to all our old friends and any new ones that are interested in berry growing. The new fall bearer, Progressive, is a great addition to the strawberry world. Be sure and include them in your order for 1917.

THE TRUTH ABOUT IT

No. 6 Bulletin Free

This is the latest book describing our high-class magneto telephones. Write for a copy.

IN Nova Scotia a campaign of misrepresentation has been conducted against us. Our competitors have stated that Canadian Independent Telephones have not given satisfactory service.

During the past month we have received letters from Nova Scotia systems that have been using our telephones for two and three years. They have expressed themselves as being completely satisfied with our telephones. We would be glad to send copies of these letters to any one interested. They deal most effectively with any misrepresentations that have been made about our telephones.

The truth of the matter is simply this:—Our telephones are of such outstanding high quality that any qualified telephone purchaser would inevitably select them if they were given a searching comparison test alongside others.

We invite you to make such a test.

EFFICIENCY IN FARMING

Will be the foremost need of Canada when the War is over

YOUNG MEN OF THE MARITIME PROVINCES GET READY TO TAKE A COURSE AT THE

College of Agriculture, Truro, N.S.

Free to all Students of the Maritime Provinces. New Buildings and Equipment, and a stronger body of Instructors than ever.

COURSE BEGINS

NOV. 1st, 1916

The most of the graduates will farm, and there is room for all. There is also a large and remunerative opening for well-trained men in professional lines.

Instruction is offered in all branches of Farming, Live Stock, Dairying, Horticulture, Poultry, Veterinary Science, Botany, Bacteriology, Entomology, Chemistry, Physics, English, Mathematics, Bookkeeping, etc. An all-round education.

Such education, while valuable primarily to the farmer, will be useful in all walks of life. Students completing the course can enter without examination the third year at Guelph or MacDonald College. Those who have already done so have stood at the head of their classes in these Institutions.

Special Two Weeks' Short Course for Men and Women begins

JANUARY 2nd, 1917

Fuller announcement later. Write to the undersigned for furth er information

SPRINGVALE HERD

Of choicely bred Ayrshires, Dairy Test Winners, herd numbers 30 head. Before buying, come and inspect our herd and get prices.

FRED S. BLACK & SONS
AMHERST, N. S.

Maple Green Farm Holsteins

To avoid inbreeding, we now offer for sale our senior herd bull "Maple Grove Mercena Mercedes," coming 5 years old; weight about 2500 lbs., active, sure and exceptionally kind. His first daughter to be officially tested made 15.46 lbs. butter in 7 days at 1 year and 11 mos.; another at 2 years and 2 mos. was making nearly 3 lbs butter per day when she met with an accident and we had to drop testing her. His dam gave 12664 lbs. milk and 568 lbs. butter at 2 yrs. old in the R.O.P., and her sister Posch Mercedes Springbank 2nd, is the Canadian Champion 4 yr. old in the R.O.P. with 22000 lbs. milk and over 800 lbs. butter in the year. We are also offering Bull and Heifer Calves sired by him and "King Lyons Colantha" and out of high-class Record of Merit and Record of Performance Dams.

For further particulars write

R. L. HICKS
Dalhousie Jct., - N. B.

Springbrook Ayrshires !

Present offering several choice Cows and Heifers, all ages, and Bulls ranging from 6 to 17 months, sired by our imported prize winner, Grange Kelly, and out of some of the best cows we ever owned. We have also two choice Bulls, about 15 months old, sired by Springbrook White King. We can also sell some nice grade Ayrshire Cows, fresh or about to freshen.

Write us your needs in the Ayrshire line—we have started many young breeders on the right track and have replenished the herds of some of the older breeders. We can supply your wants.

See our herd at the Halifax Exhibition or better still come to see our herd in home quarters. Interested parties always welcome.

McINTYRE BROS.,
SUSSEX, N. B.

BUFF ORPINGTONS

I have changed my place of residence from Amherst to Oxford Jct. N. S. and am better prepared than ever, to supply those wishing Buff Orpingtons stock or eggs, the ideal table fowl and winter layers. Our winnings at the Maritime Winter Fair against strong Competion were as follows 1st cock 1st hen 1st cockerel 1st 3rd pullet, 2nd utility Cockerels 1st & 2nd utility pullets and 1st pen.

Our breeding pens are mated as follows

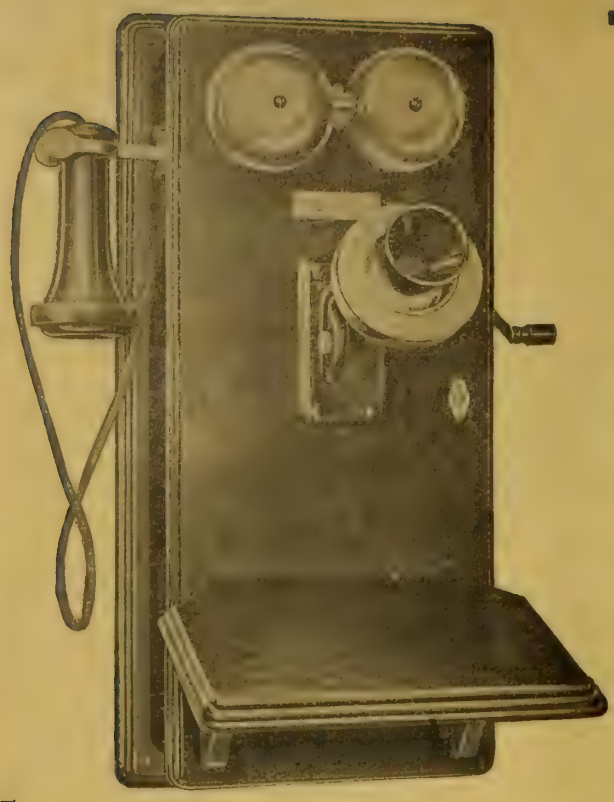
"The Orchards" - Sussex, N.B.



Three Out of One Hundred Disagree With Us.

IT is pretty good sense to judge a man by his friends also by those who disagree with him. Judge telephones likewise. Out of every hundred farm telephones in Canada, ninety seven are Northern Electric, three are of some other make. Just the sheer force of numbers seem to prove that the best of all is the renowned

Northern Electric No. "1317"

But take the telephone itself—let us see what is inside of it to learn this overwhelming favor. Check up the comparative merits of transmitter, receiver, battery, generator, ringer and cabinet work. Point by point compare No. 1317 with all others then you will know why three out of every hundred farm telephone users are willing to experiment and suffer possible loss and dissatisfaction.

Large stocks of the No. 1317 telephones are carried at every one of our branch houses. Write to the branch nearest to you and they will be glad to answer every telephone question, fill every telephone order, not only for instruments but for batteries, line construction material, tools. etc. Write them for a copy of our interesting new booklet "How the telephone helps the farmer." Use the coupon today---there is no obligation.
